On page 363 I notice what you say about the popularity of the Dovetailed hive; and so far as the dovetailing is concerned, or, more correctly speaking, the notching, if you make it as accurate and even as the box-factories, certainly your patrons will like it, all of which I studied on and talked about to my students several years ago when we came near putting in machinery for the purpose; but after all, friend Root, when I remember how many such practical bee-keepers as Prof. Cook, Hutchinson, and scores of others I might mention, feel in regard to my modification of the Langstroth hive as against the Simplicity, I feel very certain that it is the changing from the one to the other that gives your customers such satisfaction. I have made my modification of the Langstroth hive, with loose bottom-board with the cleats tacked on, the same as I use with my new hive, and sold them in that shape for about two years; and you will see that the Simplicity will be rapidly superseded by what I suppose I may call the Heddon-Langstroth. In a foot-note to a former article you call my attention to the fact that using cleats to make a beespace on the bottom-board was prior to my invention of it. Certainly it was. I willingly admit that; but that arrangement is no part of my patent, except when used in combination with a divisible brood-chamber, etc. I think I can agree with the several customers you mention, in saying that you will undoubtedly find this the best and most practical hive you have ever sold, and I really wish I had one to look over as a sample. I am mainly interested in the quality of your workmanship all over the hive, and especially in the notching at the corners. I inclose order for a sample hive.

Dowagiac, Mich.

JAMES HEDDON.

Although I am favorable to the closed-end frames, I must say that I can not manipulate and examine in the same time as much comb surface in a divisible Heddon hive as in the old-style full-depth Langstroth. Perhaps it is because practice has not made perfect in my case. I have also tried, several times, shaking bees out of the brood-sections; but, my! how the bees did boil all over the bottom-board, in the grass, and—up my trowsers legs! Perhaps I have not yet quite got hold of the knack of it. We shall take great pleasure in sending you a Dovetailed hive. Test the strength of the corner. ERNEST.

HOW TO DRIVE ANTS OUT OF BEE-HIVES—MANUM'S METHOD.

HOW TO USE THE MANUM SWARM-CATCHER.

JUNE 1.—"Mr. Manum, what shall we work at to-day? We have got the sections all filled with foundation, the new hives nailed and painted, and I can't think of any thing more to do here."

"Well, Leslie, I have heard you and the other boys talking about going trout-fishing when you got the work done. It is now done, and I propose we all go to-day. While Fred and I are hunting up the fish-tackling, you boys may get the bait; and to-morrow we will work at the bees."

JUNE 2.

"Here we are, Will. To-day we are to see that the queens are all laying well; and where we find any with only 10 or 11 combs we will give them more, as I think they are all strong enough now to cover the 12 combs. However, if you find any that are not, we will run them through the season with what they have, unless we give them a card of brood from a very strong colony that is liable to swarm before we come here again; also see that they have honey enough to last a week or ten days. Be sure not to forget that, because this is the trying time with the bees, it being the period between fruit and raspberry bloom. The bees are rearing so much brood now that they use up stores very fast, and the bees that will hatch in the next 20 days are just the bees we want to gather our surplus; hence it won't do to starve them now. We will now fill these carrying boxes with combs containing honey, and take them along with us to save steps."

"Here, Mr. Manum, I wish you would look into this hive."

"Oh! *ants!* and a lot of them too! Well, just wait a moment while I go to the honey-house. There, I will put some of this tarred paper in the hive, and by to-morrow every ant will be gone. This is the simplest remedy I ever tried. Now, as there are no more combs with honey in we shall have to put on sections partly filled with honey, left over from last fall, wherever they need feeding. It makes it pretty handy to have these partly filled sections on hand. We will just uncap the honey, and by the time we are here again the honey will all be below, and then the sections can be taken off."

JUNE 6.

"Now, boys, I noticed yesterday that the raspberries were beginning to blossom, and I think it is time you should go to your respective yards. Fred will take two of you to your yards. Leslie will go to his by the railroad, and I will go with Scott to his yard. (Henry has a family, and lives near his yard.) Here we are, Scott. You will board with Mr. Smith while here."

Scott says, "Mr. Manum, I wish you would lay out some work for me to do while I am waiting for swarming."

"Work! you will find there is work enough before the season is over. In the first place you should examine every swarm, to if see any of them need any thing. You may find some that have lost their queen, as there are a few three-year-old queens in this yard; and you know some of them are not full of comb; and where you find such, if they are pretty strong, and the queen laying well, you can spread the brood-nest and insert a comb in

the center. It will be safe to spread now at this season."

"What shall I do if I find any that are queenless?"

"You will find that such colonies have queen-cells, and if the bees are pure and large, with long wings; and the stripes—or bands—instead of being light yellow are of a yellowish-brown, you may leave one to hatch; but if they are not pure Italians, or if the bands are of a bright yellow, or if the bees are small-bodied and short-winged, you may cut the cells out and give them eggs from one of those hives we have marked to breed from."

"Light-yellow bees may answer in the South, where the climate is more mild than here; but here in the North I find that the dark, or leather-colored bees, are preferable, hence I do not breed from very light-colored queens."

"Now, when you give such a colony a card of eggs for queen-cells you should cut holes in the comb the shape of an inverted A, or, more properly, an equilateral triangle, with the point upward."

"Mr. Manum," says Scott, "the books nearly all say that a long slit should be cut in the combs. Why is this triangle shape better?"

"Because it does not weaken the combs so much as a long slit does; and, besides, I think the bees prefer to build cells on a nearly perpendicular edge rather than on a horizontal one. Probably by the time these cells are old enough to transfer, you may need queen-cells in some other hive, or you can use them in your queen-rearing nuclei."

"After you have looked the bees over, the next thing to do will be to level up all the hives, as they are liable to get out of level during the winter. It is important that they be perfectly level; for unless they are, you will be bothered to get straight combs in the sections."

"When you have done that you will want to clean up the yard. Here is a rake, a hoe, a shovel, and a basket. I like to see a yard kept clean, during the working season at least. You can then mix some paint, and paint such hives as need it. Should there be a rainy day you can fasten foundation in the brood-frames. I don't like to fasten it in at home, as it is apt to break down when transporting it over our rough roads; and, besides, I want work for the boys to do rainy days, or you would get lonesome."

"Well, Mr. Manum" says Scott, "you were right when you said I should have work enough to do. I think I shall not have time to get lonesome—ha, ha!"

"Now I must go. I shall call on you in three or four days; and after you have learned how to hive bees after my method, I shall come only once a week. I aim to visit each yard once a week, hence I have to visit two some days, as I have eight yards, and there are only seven days in one of our Vermont weeks. Now, if I should *happen* to be obliged to visit you on Sunday, please don't ever mention it so Mr. Root will hear of it, for he would surely give me a talking-to, and I know I could never stand his reprimand. Good-by."

JUNE 15, AT CATON APIARY.

"Good-morning, Will! How are the bees doing here?"

"Pretty well for the last two days. Yesterday the scale-hive gained 6 lbs."

"If that is the case, some of the hives must be ready for the boxes. Let us open some and see. Yes, this one ought to have boxes on at once. You

see, every comb is full of brood or pollen, and some honey; and, as you see, every cell from which a bee has hatched is full of new honey and bits of new comb built on the upper edges of the frames. This indicates that more room is needed. You may get a clamp of sections for this hive; also a sheet of enameled cloth to cover it with."

"One of your clamps, Mr. Manum, will not cover the brood-chamber; do you not want two clamps?"

"No, I put on only one clamp at first; and after four or five days, if the honey continues to come in, you may put on another."

"Do you like such small clamps as well as *whole* clamps that cover the whole hive?"

"Yes, for several reasons. First, they are much nicer to handle in the apiary and in the honey-house. In the next place, if I used large clamps holding 32 one-pound sections instead of clamps that hold only 16 sections, they would be larger than the bees ought to have at this time. It would be giving too much room at first; and, again, at the close of the honey season I find it very convenient to taper off with these small clamps. There, I place it on the further side of the hive from me; now cover the clamp with the enameled cloth, black side down, and lay the half honey-board under the hive where it will be out of the way until it is wanted after the honey season is over. There is a swarm coming out!"

"Where?"

"From No. 60; get me the swarm-catcher and I will show you how I do it. There, open the catcher-cage and hold it to the entrance and catch as many bees as you can and close it; lay it down and watch for the queen; as she is clipped she can't fly. There she is. Now I take her and put her in this little round pocket-cage that has a small wire hook to it, and hang this cage outside the catcher. It would be as well to put the queen right in the catcher; but in doing so some of the bees would escape; and, besides, by having the queen in this small cage she can be handled better than in the large catcher-cage. Now I see the swarm is circling over the north side of the yard. I take the catcher and set it up directly under the swarm, and leave them to themselves and go about putting on boxes as before, at the same time keeping an eye on the swarm. As I have explained to you how to hive the bees, it is not necessary that I repeat it, for I see you hived those six swarms yesterday all right. The next time I come I will show you about tiering up the clamps, preventing second swarms, contracting, etc.

"Now one word before I go. Be sure to keep a close lookout for swarms, because it is much easier to get the queen as she comes out of the hive than to hunt for her if she gets in the grass; and, besides, the sooner you get the catcher set up, the more likely you will be to catch the swarm and prevent their clustering in a tree or returning to the hive. Hence when you see a swarm coming out, *hurry* to it at once. Yes, *run* if you are a slow walker."

A. E. MANUM.

Bristol, Vermont.

There is one thing I don't like about the above. You let the boys all go trout-fishing, and then you did not take even one line to tell what luck you had, nor whether the trout were good, etc. Now, when I get my vacation to go up your way, I am going trout-fishing, and I am going to tell the

readers of GLEANINGS all about it. Probably a great many of them never saw a speckled trout at all, and more of them never tasted one. You folks away up in Vermont need not think you are going to monopolize *all* the good things.—Your plan of driving out ants is unique. Why, just think of it! Tear off a piece of tarred paper, and toss it into the hive. Mrs. S., down in the lunch-room, just told me that the ants were getting into the granulated sugar. I guess I'll "holler" to her to throw in a piece of tarred paper. The packers are using lots of it in the adjoining room. There is another reason for favoring clamps holding 16 sections instead of 32. A good many people would buy a clamp of 16 when they would not buy 32—that is, if you sell them in the clamp.—By all means, run when swarms are out. If you can not get up enthusiasm enough to *run* in swarming time, you will never succeed as a bee-keeper.

SETTING BEES OUT.

SHALL WE PUT THEM ON THEIR OLD STANDS,
OR SET THEM OUT AS CONVENIENCE DICTATES?

I CAN see that some of our best authorities differ on questions of vital importance to bee-keepers; and while this shows independence of thought, and perhaps, in some instances, a variation of circumstances which we do not take into consideration, yet there is one point which, so far as I can now see, there is a variation of opinion upon, which must be largely due to an expression of opinion without careful observation. The question is as to whether bees locate themselves afresh after being in winter quarters, or if, after months of confinement, they simply fly out; and if the hive has been on a new stand they return to the old location. I see no less an authority than "Langstroth on the Honey-Bee," revised by Dadant, considers it important to have them placed upon their old stands. Now, I have been taught to the contrary, and always preached to the contrary, but I could not say who was correct. Considering the question a somewhat important one, especially if a part only of the bees would be set out each day, I observed closely this spring. The bees were not placed upon their old stands when taken out, and they were set out partially one day and more later; half of them were moved to an entirely new yard, three-fourths of a mile away, and I can say with certainty that the bees did not fly out and return to the old stands, in those instances at least. Now, I claim there is enough to attend to that requires all our time and energies; therefore if there is nothing to be gained by observing and marking the place and hive of each colony, let us not do it. I would substitute the weighing of every colony at the close of the honey season; again when going into winter quarters; again when issuing from the winter repository, and again after the colony has had a cleansing flight. I believe an extensive test of this kind would give us information of value, and would prevent the loss of many colonies. My bees consumed an average of about 6 lbs. per colony in the front row, probably 11 lbs. in the back row, and the lowest consumption was 3 lbs.; the highest, I believe, 19 lbs., which

shows me the necessity of having not less than 20 lbs. of stores to go into winter quarters with.

A BOUNTIFUL HARVEST.

I have thought a good deal this winter of the prospect for 1889 for a honey harvest. You know the past two seasons have been none too good. The last year, in fact, as an occupation alone, meant starvation to many. Now, if the farmer had such a failure of crops, we should have prayed all over the land, asking God for a bountiful harvest. Now, I know you and many of us have faith in prayer; why, then, should we not "ask in faith, nothing wavering"? Of course, we know in this, as in all temporal matters, we should say, "God willing."

R. F. HOLTERMANN.

Brantford, Canada.

I believe I agree with you—or at least pretty nearly so. When bees are moved to an out-apiary—say for three or four weeks—they will certainly remember their old stand and make trouble if you don't put them back on their old stand when you get back; but after having been in the same place for *three or four months* I am of the opinion that there will not be enough going back to make it worth our while to be very precise about it.

MY BEE-CELLAR AND WINTERING REPORT.

SAVING STORES BY UNDERGROUND WINTERING.

PERHAPS it is getting a little late to talk about wintering, but I think a record of my experience last winter may be of interest to some. Previous to last winter I had always wintered out of doors, except for a couple of small experiments with cellar wintering under unfavorable circumstances. But although I had never had any serious losses, and had usually had the best of success in outdoor wintering, I have long wanted to try wintering in the cellar, provided I could make a cellar I considered satisfactory. I did not want to be obliged to fuss with hard-coal fires, oil-stoves, sub-earth ventilators, etc., to keep the temperature up or down. I thought a cellar ought to take care of itself, and such a cellar I now have.

My apiary is situated just on the edge of a bluff about 70 feet high. At the bottom of this bluff is a vein of coal, scarcely thick enough to be profitably worked, yet mined to some extent. A year ago last winter I set two men at work to run a "drift" directly under my apiary. When completed as far as I cared to have it, it was a hole from three to four feet square, running 60 feet straight into the bluff, then at right angles to form a chamber. This was my wintering-cellar. Well drained, propped, and secured, it cost me nothing. Sixty feet away from the outside air in any direction, changes of temperature outside could scarcely affect it, hardly a ray of daylight could ever come, and no sound or shock ever came from the outside world, except the very faint rumble of a train passing near by on the bluff above.

Between Nov. 24 and Dec. 4 I put into this cellar 31 colonies of bees. Until Jan. 10 the mouth of the mine was left entirely open, the temperature inside ranging from 45 to 50°. I then put in a rough board door, having numerous cracks through and around it, but no other provision for ventilation.

The temperature now rose to 52°, never going below 51, and only once rising to 55, after long-continued warm weather, 70° outside, in the shade. I had feared that the cellar would be rather damp; but it did not prove so, and very few combs showed any mold. The bees were quiet all through the winter; and when removed, most of them Apr. 10, they were clean, dry, and slim-bodied, only two showing any signs of diarrhea. All were alive, though two queenless colonies had to be united.

I have just examined all thoroughly; and in amount of brood and bees they compare very favorably with those wintered out of doors. The saving of honey was very marked. I am sorry that I did not weigh each and keep a record; but to the best of my belief and judgment there was an average saving of six pounds of honey per colony.

I make this report, not simply because it is a successful instance of cellar wintering, but to show that bees will live, keep quiet, and thrive, in a cellar much warmer than is usually considered proper. If may, too, give a hint on cellar construction to some.

Of 85 colonies wintered out of doors, all were alive, but two were queenless, and were accordingly united, which I think closes the list of my winter losses.

J. A. GREEN.

Dayton, Ill., Apr. 27, 1889.

Well, friend Green, you have a bee-cellar that is all right, I should think, if anybody has, unless, indeed, from 50 to 55 is too warm. Why not leave the openings unobstructed, so as to reduce it from 45 to 50? You say it cost you nothing. Surely running a drift 60 feet must have cost quite a little sum of money. I am curious about the matter, because I think I can get a spring for irrigating by running a tunnel horizontally into a side-hill; and I wish that somebody would tell me the cheapest way to do it. I suppose a 4 to 6 inch tile would answer just as well as a tunnel, if large enough for a man to crawl in. But how am I to run a tile, say 200 or 300 feet into the hillside? Some of the readers of GLEANINGS who are used to coal-mining can perhaps tell me how to do it cheapest. I very much prefer tile to a wooden tunnel. So far as I know, wood seems to be the only material used for running into a hill.

THE ALABAMA "BLACK BELT."

FRIEND CURTIS SUGGESTS EMPLOYMENT FOR OUR LEISURE HOURS.

FRIEND ROOT:—It is a long time since my name has appeared in GLEANINGS; but our work among the freedmen, in which I have been engaged for the last ten years, is too taxing on time and strength to allow much writing on outside subjects. I generally manage, however, to glance through GLEANINGS, especially "Our Homes;" and your California notes, and the Question-box, have intensely interested and greatly profited me.

The answers to Question 104, about the employment of our leisure hours, have particularly rejoiced me. Can any other secular profession show so many earnest Christian workers? The fact so

often exemplified in GLEANINGS, that very many of our most prominent and successful bee-keepers are deeply interested in all Christian work, encourages me to tell a little about our work of "spreading the knowledge of the truth as it is in Jesus." As brother Hasty says, it is *our* great business; and with us only leisure hours can be spent among our little golden workers, much as I love them.

For many years I have been deeply impressed with the terrible destitution of our country districts in the South—especially in the seventeen counties of what is called the "Black Belt of Alabama." This is a belt of rich agricultural lands, mostly black in color, containing magnificent bee pasturage, by the way, and running from southeast to northwest across the State into Mississippi. Here were the great slave-plantations before the war, and here the freedmen and their descendants have remained and increased until they outnumber the whites five to one. As the vast majority of the whites are in the cities and larger villages, the country population is almost wholly black. There are perhaps 30,000 colored people in the cities and villages of this Black Belt, where they have good schools and churches, and are improving rapidly; but at least 450,000 are on the plantations, where no missionary work is being done to any extent, and the public-school fund is so deplorably inadequate, and so poorly administered, that the statistics show that there are actually many more illiterates now than there were 20 years ago; i. e., the State has not nearly begun to educate the *increase*. The dense ignorance, superstition, immorality, and poverty of these thickly populated country districts can scarcely be imagined until seen. The country preachers, who wield great influence among these people, are in many instances worse than the people themselves. I have had five preachers at work for me at one time, who could not read a word of the Scriptures. They pretend to expound or write their names, and one has just been convicted of hog-stealing in an aggravated form. I have heard two preachers maintain in public that they were better preachers because they could not read a word, and therefore had to be taught by direct inspiration of the Holy Ghost. Another, a woman, claimed to be a great prophet. She had killed a woman by order of the Almighty, and raised her to life again, she said, and the people swallowed it all without a protest.

Some years ago, in our Selma ministers' meeting, the question of the evangelization of these country districts was raised. Brother Woodsmall, a Baptist missionary who had spent many years in the South, travelling extensively among the colored churches, said that it was his opinion, that, in the thickly settled cotton districts, the people were growing worse instead of better. A presiding elder of the A. M. E. Church (colored) followed in a similar strain with some terrible illustrations from his observation. I then proposed a plan for a self-supporting missionary and educational work, which, after much thought and prayer, and years of careful observation and experiment, is now being successfully carried out by the Industrial Missionary Association of Alabama. This is a stock company, organized under the laws of Alabama, with the purpose of buying plantations, renting them out to the colored people, and using the rents and income to supplement the public-school fund, and aid the people in supporting a more enlighten-

ed ministry. Many of these plantations can be bought at such low prices, on account of the rapidly increasing numerical preponderance of the colored people making it unpleasant for the whites to remain, that the rents will pay from 15 to 40 per cent on the purchase money, making quite an income for missionary work.

The negroes have been made and kept poor in very many instances, not so much by excessive rents, which are cheaper here than in the North, as by the excessive and often fraudulent "advances," which eat up the crop before it is made, and the ignorance and unskillful management of the tenant himself. Justice, fair dealing, advice, and instruction in improved methods of agriculture, and in household economies, together with improved schools and churches, will do wonders toward helping the colored man to help himself; and as soon as possible we mean to sell to each renter his homestead, invest the money in other plantations, and thus turn it over and over, and keep it working for the Lord and his people. This is not a new experiment. For four years we have been trying it, with very limited means, to be sure; yet we have two churches and schools under our auspices, and feel more than ever confident that this is the most efficient method and practical plan of reaching these, the most destitute regions in all our land. If we could command the means we could do more in this way to help solve the vexed "negro problem," which is attracting so much attention and discussion of late, than by any other plan that has been proposed. We have now decided to appeal to the public for help to extend our work, hence the incorporation of our association, in which we cordially invite all our friends and all who desire to see this "open sore" of our land healed, to take stock. Rev. J. W. Dill, of Selma, is the treasurer of the association, to whom all contributions and subscriptions for stock should be sent; and I shall be only too happy to give any further information, or answer any question, either through GLEANINGS or privately, as may be desired. It seems to me that we owe this people whom we enfranchised without educating, and who, on account of their ignorance, are in far greater danger and distress now, both from the white people and themselves, than if they had never had the right of citizenship, something more than an occasional thought or prayer. We owe them our *best help*, and what better way to help than this? I feel sure our bee-keeping fraternity will not be behind in this matter. C. B. CURTIS.

Selma, Ala., Feb. 8, 1889.

Why, old friend, you have gone and taken hold of and grappled with one of the greatest problems that stand before the people of the United States of America. One is reminded of David and his pebbles from the brook, when he went out to meet Goliath. Never mind, brother. The Lord God is with you, even if you are contending with fearful odds.

Since the above was written, Bro. Curtis has been with us, and we learn that he has been for ten years connected with the work of the American Missionary Association in the Southern States. Right here our stenographer suggests that, even if a great many of us do not know much about these things, the probability is that we shall *have* to know, whether we want to or not, very soon,

HOW TO RAISE BUCKWHEAT.

"IN THE MULTITUDE OF COUNSELORS THERE IS WISDOM."

IN answer to our call for articles on buckwheat culture, the following have been received up to date. In most localities I presume it will reach our readers in ample time to prepare the ground and get in a crop. As communications are constantly coming in, we shall have a continuation of the matter in our next issue.

BUCKWHEAT IN NEW JERSEY.

Buckwheat, like rye, is a grain which will yield a fair crop on poor ground, though of course a better one on good ground. Still, it is not advisable to manure it very highly, as it is very apt to "lodge." I doubt if the increased yield of grain would pay for the use of chemical fertilizers, while doubtless the lodging tendency would be increased. With us it is generally sown on rough, stony, or out-of-the-way fields, where a drill could not be used, and for this reason it is usually sown broadcast, using about three pecks of seed per acre. Buckwheat seems to do best on "new" ground—ground recently cleared of wood; and it is especially valuable in taming or subduing such land. Old meadows, and reclaimed lands generally, that are too "sour" to produce crops of corn are sown with buckwheat with this taming idea.

A favorite rotation for re-seeding, with grass, heavy clay lowlands, is buckwheat one year, oats the next, and grass without grain following oats, the same year. Buckwheat not being sown until the fore part of July, this allows ample time for getting heavy clay lowlands in shape for sowing. I say the fore part of July, but it is almost a superstition here to sow buckwheat "the Fourth of July, wet or dry."

I never heard of buckwheat making two crops in a single season here, but it is often sown early in spring, to be plowed under, and the land sown to buckwheat in July.

Much diversity of opinion exists about plowing buckwheat under, some claiming that it is a positive injury to the land. I think that trouble has arisen out of the practice, only when the buckwheat was plowed under while in full blossom. Avoid doing this, and you are all right. The ground should be well prepared for buckwheat. If it can be plowed some time before the grain is to be sown, at seeding time, the buckwheat sown on the plowed land, *cross-plowed* in and well harrowed, the chances for a good crop are enormously increased.

In harvesting, buckwheat is commonly cradled, before frost if possible, and preferably in the morning, while the dew is on, or on a damp day, as the grain shatters easily. As it is hard to dry the straw sufficiently for thrashing, it should be left in swaths for three or four days, then raked in bunches or gavels (again preferably while the dew is on), and set on end, unbound. It should be thrashed on a dry windy day, and should be cleaned from the chaff at once or it may heat. Even the grain, if in large quantities, may require shoveling over in the bins to prevent heating. In large amounts, or if slightly damp, thrashing by machine is the easiest way; if quite dry, it is easily thrashed by hand, two men thrashing it about as

fast as two horses can haul it to the barn; or if the barn-floor is reasonably large, the buckwheat may be spread thickly on it in a circle, and horses driven around over it. This latter method will give the cleanest grain and smallest proportion of cracked kernels. But use the machine every time unless the buckwheat is dry.

The straw is useless for litter, but it is the best thing obtainable for the bottom of the barn-yard, coming up from the ground so clean in the spring that very little scraping is necessary.

The new Japanese buckwheat, introduced here some three years ago, is growing rapidly in favor. It produces much more grain to the acre, and more and better flour to the bushel, than any of the old kinds. With no previous intimation, I detected the superior flavor of the Japanese flour the first morning we had cakes made from it. We had immediately before been using silverhull flour.

Bees gathered very little honey here from common buckwheat last season, but they worked freely on the Japanese.

R. A. LEARNED.

Newton, N. J., May, 1889.

BUCKWHEAT IN CANADA.

To prepare the ground for buckwheat, if stubble land, plow in the fall, then in spring stir the ground frequently, to make weed seeds germinate, and to destroy them in turn when started. If the field needs manure, and you have it to spare, put it on and plow, say about ten days before sowing the seed, and drag down again. This will cause an immense lot of noxious seeds to germinate; drag again to kill these and start more, and now the process of putting in the seed will kill these. If not underdrained, and if the soil is of a clay nature, open water-furrows, and roll; and I feel pretty sure you will feel happy every time you take a look at that buckwheat field. A crop of any kind of grain growing luxuriantly upon nice, clean, well-pulverized soil, can not fail to give pleasure, and make one think of God and his goodness. If a piece of sod be fixed upon, I would plow it about 12 to 14 days before sowing, and drag frequently. A roller should follow the seed. A drill covers the seed better than a drag can cover that sown by hand.

Some cut their buckwheat in the old way—with a cradle; others use a reaper. I really don't think there is much difference in the final results, if hands be plentiful and hiring has to be done all round. Buckwheat is now mostly thrashed with a machine; however, all counted, with from one to four acres it can be thrashed more economically, I think, with flail or with horses. When the crop is ready you can go right at it, and no waiting for a machine until it rains again.

To thrash with horses, you want two teams—one with a couple of smart boys to draw to the barn. Put on just enough for one flooring. The other team, with a couple of good men, will thrash it and shake the straw off while the boys get another load. If you put on the wagon more than one flooring at a load it will get damp from the sappy straw, and thrash very tough. Proper care should be taken to have the grain dry when grinding time comes.

Some object to this crop because of its persistency in growing the following summer in the succeeding crop. Well, I always got over that difficulty by sowing oats or planting corn on the stubble land. We never sow it early in the spring, like oth-

er grain. The hot summer sun would destroy the crop, very likely nineteen times out of twenty.

A HYBRID.

Some years ago I mixed some silverhull and common buckwheat, and sowed the two kinds together. The third year the grain was nicely blended, resembling both varieties, and I fancied yielded a better crop than either of the others.

BEES AND BUCKWHEAT.

These thrive well together. With me the latter never failed to yield nectar, and always produced, I am fully persuaded, better crops because of the frequent visits of the bees.

DOES BUCKWHEAT PAY?

To the man who keeps many bees in a section of country where it is pretty sure to produce honey, I would say I certainly think it pays well, if properly handled all the way through—all depends upon that.

S. T. PETTIT.

Belmont, Ont., Can., May 1, 1889.

BUCKWHEAT IN KENTUCKY.

The ground for buckwheat should be thoroughly well prepared before the seed is ever sown, as, in fact, this is necessary for the successful growth of about any crop. Of course, the richer the ground, other things being equal, the greater will be the yield. Tolerably high bottom ground, second year's new ground, or any soil good for oats or wheat, will do for buckwheat. Ground that has been in clover, and followed with corn, is suitable, for the reason that the thorough cultivation required by corn keeps down the weeds and grass. It is not an easy matter to kill weeds after the buckwheat is up, hence the preparation of the ground the previous season is of much importance.

The ground should be broken early in the spring, before the weeds and grass begin to grow; then again when you wish to sow. It is somewhat owing to the locality and the purpose for which you are growing buckwheat as to the proper time for sowing. About the 20th of May or first of June I think is the average time, and three pecks of buckwheat is the amount usually sown on an acre. Just before sowing, the soil should be thoroughly pulverized, and leveled by harrowing.

The seed-bed should not only be deep but fine. In fact, the pulverization of the soil should be the main object; and the finer and more complete it is, the better the growth of the crop. Some practice drilling the seed and fertilizer together, but I believe the fertilizer should be applied broadcast, as it is more evenly distributed over the ground. If stable manure be used it should be well rotted, and thoroughly mingled with the soil, in order to give the field uniformity of growth. About 200 lbs. of guano to the acre should be sown, unless the ground is rich enough naturally.

When most of the seed is ripe it should be cut, and tied up in bundles. After it is thoroughly dry it should be hauled and piled or stacked in a tight-floored barn. It is also very necessary that the wagon-bed have a tight bottom, so that the shattered grain may be saved. I believe, where a person grows only a few bushels for his own use it is cheaper and easier to thrash it out with the flail. It would be much the best, when a person has much of the grain to clean, to get a separator to come to the barn and thrash it out. In this neighborhood the cost would not be over seven cents per bushel, even if the thrashing season were over.

I will only add, in conclusion, that I believe one of the best uses to which buckwheat can be put is that of feeding to hogs. By having different fields to mature at different times, we can turn our hogs into the fields from July till October.

Skilesville, Ky.

FINIS A. WOOTTON.

BUCKWHEAT IN KANSAS.

As you call for reports in regard to buckwheat, I will send you mine. Last year I raised 116 bushels—85 of Japanese and 31 of silverhull. I think the Japanese quite a bonanza. The beauty of it all is, that I was just 116 bushels ahead of nothing. As soon as my oats were off, my son plowed the stubble under. I sowed the seed broadcast. I also sowed one acre of my wheat stubble, after he had turned it under. On this I sowed 3 pecks, and secured 28 bushels of Japanese, and then lost at least 5 bushels of it in cutting.

HARVESTING BUCKWHEAT.

I cut mine with a mower. I had three hands—boys will do—to follow right after the machine, with four-tined forks. They gathered it in bunches, just as large as would dry through nicely. These bunches they lifted out of the way of the machine by the time it came around. I tried the self-rake, but I prefer the mowing-machine. The buckwheat should be cut while the dew is on. If necessary, cut all night, if you have much to cut. I hired a man to flail it out. To do this, make a platform up about two feet from the ground, of rails, and thrash it on that. I then put mine through the fanning-mill twice. Right here is the best part of the whole matter. That acre of wheat stubble on which I sowed buckwheat looks as well to-day as any of the rest of the 20 acres of wheat. The wheat is almost knee-high. When we were done sowing the other, I said to my son, "I am going to try an experiment." Ours is a Havana press-drill. The buckwheat stubble was so mellow that I just put the drill right in on the stubble. I now intend, as soon as the wheat is off, to have the wheat stubble of the whole 20 acres turned under and sown to Japanese buckwheat. But whether to sow the buckwheat with the drill or not, I should like to know, without experimenting very much. I had thought that, perhaps, if we would sow half that amount one way and then cross it with the other half of the seed, it might do. You know the old saying is, "Sow your buckwheat so that an old sheep and her lamb can lie down between the stalks;" but my idea in sowing wheat or oats is, if you want grain you must sow liberally. For buckwheat I sow about 3 pecks per acre. From our buckwheat we took off 300 lbs. of nice honey, and had all the nice buckwheat cakes and honey we wanted.

J. H. KENNEDY.

Quenemo, Osage Co., Kan., Apr. 25, 1889.

THE PROPER WAY TO RAISE BUCKWHEAT IN A DRY SEASON; HOW IT MAY BE USED TO GET RID OF THISTLES.

Having had 20 years' experience in raising buckwheat, I will give you a few pointers. First and most important of all, is to plow the ground early. Plow immediately after sowing oats or planting corn, or, in other words, one month before sowing. To kill "quack-grass," plow twice, and thoroughly harrow in with a spring-tooth harrow. Under no other conditions would I allow buckwheat ground to be plowed twice. You can kill thistles every time with buckwheat. Wait till the thistles are 15

or 20 inches high. You can then plow them entirely under by fastening a log-chain to the plow-beam and to the whiffletree of the horse that walks in the furrow. That way it will form a loop that will pull the tops in the furrow; and by having the loop just right it will cover every one. I have plowed them under when they were so large that the horses would not walk in the thistles without having leathers on their legs to prevent them from pricking them.

Buckwheat requires a great deal of moisture; and by plowing early the ground gets settled, and holds the moisture; and the result is, it will fill better.

Japanese buckwheat is 8 or 10 days later than the silverhull with me, so I sow a little earlier. On good land, 2 pecks is enough; on thin soil, 3 pecks per acre. You can increase the yield a third on thin soil by using 50 lbs. of phosphate and 50 lbs. of plaster, mixed and drilled in. I drill here between the 15th of June and the 1st of July.

Buckwheat is one of the best crops to subdue rough land. It always leaves the soil in excellent condition for potatoes or oats, or almost any crop except corn. I never could raise good corn after buckwheat—that is, until the ground was re-seeded. I raised 45 bushels of Japanese buckwheat from one bushel, sowing on $\frac{1}{4}$ of an acre. Let me say right here, that the black bees will store just as much buckwheat honey as the Italians, and, in fact, I should prefer the black. I would rather have buckwheat honey to winter bees on than basswood honey. In 1887 I extracted 75 bbls. of buckwheat honey; 10 lbs. per colony is the lightest yield that I ever got from buckwheat, on an average.

W. L. COGSHALL.

West Groton, N. Y., May, 1889.

ITEMS FROM ONE WHO HAS RAISED $\frac{3}{4}$ TONS OF BUCKWHEAT FLOUR IN A SEASON.

I have been a farmer for 38 years, and sowed buckwheat every year, more or less, each year, from 5 acres to 30 acres in a season. I have not been able to quite come up to the thousand bushels, but have had enough to make $\frac{3}{4}$ tons of flour of one year's crop, besides saving for our own use, and seed for next year.

The best way to prepare the ground for a good crop, according to my experience, is to plow, early in the season, good sod land; and, just before sowing, plow again. Drag and pulverize the soil well, and sow broadcast, and drag in the seed well. About three pecks of seed to the acre has given me best results in yields to the acre—from 25 to 40 bushels. I have sown as early as the 20th of June, and as late as July 17th. The largest yield has been from sowing from the first of July to the 8th. Location may have something to do as to time of sowing. As to risk of frost, we must be our own judge.

HARVESTING.

Cut when the grain is nearly all turned brown. When partly cured, rake and set up; twist a few straws around the top; that keeps it standing up better, if exposed to storms during time of curing out. When dry, so as to shell easily, we haul to the barn, and thrash with a machine. We have one standing in the barn, always ready for use. When thrashed we clean it up at leisure, mostly on stormy days.

The farmers in our county grow buckwheat quite extensively without fertilizers, and believe it to be an average paying crop to grow in rotation with

other crops. It always gives some honey, and sometimes large yields, and of good quality for the bees to winter on.

J. M. FRANCE.

Auburn Corners, Pa., April 29, 1889.

BUCKWHEAT AS A SUBDUER OF MARSH GRASS.

I have had considerable experience in the last few years in breaking up and subduing reclaimed swales, pond-holes, and marshes. I have found that buckwheat has done as much toward subduing the tough marsh grass as has the plow; and, in fact, there is nothing that can be sown which will yield a crop, and at the same time so effectually subdue such places as this grain. My plan is to plow these places, as well as possible, late in the fall, so as to let the winter's freezing and thawing operate upon the roots of the tough bog grass; and in the spring I harrow it down as soon as I can get upon it, and continue harrowing every two or three weeks until sowing time, which is about the 15th or 20th of June. The buckwheat should be sown earlier upon such places, for the frost is more apt to cut it than if sown upon higher ground. I sow about three pecks to the acre, in order that the ground may be well covered with the growing plant. Notwithstanding the plowing, harrowing, and cultivating, considerable of the marsh grass manages to be in a flourishing condition at the time of sowing; but the buckwheat so effectually covers the ground that the grass is killed, the weed choked, and the sod rotted nicely. In the fall, the once tough marsh sod is found to be light nice soil. If I can, I put the same piece into buckwheat the next season. Of course, when sown on such places it does not yield as much as when sown on better ground; but it pays well nevertheless. I prefer the Japanese to all other kinds.

F. N. HILTON.

Pontiac, Mich., May 4, 1889.

TWO CROPS OF BUCKWHEAT IN A SEASON.

As you may remember, I had quite a crop last season, of the Japanese variety. I also raised two crops last season from the same seed, which I forgot to mention. The first was sown some time in April. I remember it was chilled a little by two frosts after it came up, but it came on and filled well, and I gathered some of the seed as soon as ripe, and I sowed a small patch for a second crop, just enough for a test of raising two crops in one season from the same seed. It grew and ripened before the frosts of fall. The early part of the season was favorable for buckwheat. It might not do as well every year; if it would it would be of great advantage to know that fact. That early crop of buckwheat was quite a surprise to some old buckwheat-growers. I would sow with a drill. Drill in with chemical fertilizer, unless the soil is already very good. Load it on to a wagon, and haul to a thrasher in the neighborhood, if too small a crop to pay to employ a machine expressly for the purpose, and cut with reaper and binder, without tying.

H. R. BOARDMAN.

East Townsend, O., April 19, 1889.

BUCKWHEAT GROWING WHEN EVERY THING ELSE IS DESTROYED BY INSECTS.

To make a success in raising buckwheat requires moderately rich soil; if too rich it is apt to grow too rank, and lodge down. Fresh-plowed land, harrowed down fine and mellow, is needed. In this latitude we sow from the 10th to the 20th of June. Sow $\frac{1}{4}$ bushels to the acre, on rich land, or $\frac{3}{4}$ bushel on sandy land. Cut with a cradle, self-rake, reaper, or

self-binder. Cut when the dew is on, or a little damp, as it shells less. Set it up, one bundle in a place, to cure. When thoroughly dry, haul direct to the machine, and thrash, as every time you handle it it will shell some. I have sown early, for the bees to work on, and one year we had cool weather when it was filling, and the yield was good. But early sowing is not advisable, as buckwheat will not fill well in hot sultry weather. There is a large quantity raised here every year, and it is considered a paying crop. We often get a crop of this grain, when the insects destroy all other kinds.

Eau Claire, Wis., April 19, 1889. C. B. JACKSON.

BUCKWHEAT A FAVORITE CROP FOR BRUSHY LAND.

I see in GLEANINGS you ask about buckwheat. I have lived in a buckwheat country all my life, and know something about it. It is a favorite crop for brushy land, the crop growing so rank as to subdue briars and brush. We sow from the first to the 12th of July; if earlier, the sun burns it; if later, the frost is apt to catch it. Ground which is too light for corn will raise good buckwheat. No crop will better respond to a good fertilizer. We gather tons of honey from it. It can be thrashed readily by hand if dry, but it is impossible if damp. We always thrash by machine.

JAPANESE BUCKWHEAT TO TAKE THE PLACE OF CORN.

The Japanese buckwheat I got from you beats any I ever saw. If it continues as well it will surely take the place of corn, to a great extent.

Meshoppen, Pa., Apr. 27, 1889. C. A. DEAN.

BUCKWHEAT IN THE "CORN-BELT;" BUCKWHEAT TO EXTERMINATE WEEDS.

In this latitude, or, rather, in this corn-belt, I think the best results are generally obtained by sowing about the first week in June. Land should be plowed a week or two beforehand, to give weeds a chance to start; then work thoroughly, and sow $\frac{1}{2}$ bushel, or a little more, per acre. I sow broadcast. Land which is so soddy as to be almost useless to plow in fall or early spring for other crops, can be subdued with buckwheat; and it is good to sow in a young orchard which is to be cultivated.

Speaking of corn-belts, one might be surprised at the crookedness of isothermal lines. A very good corn-belt map, showing mean temperature during the growing season, can be found in the seed catalogue of J. C. Vaughn, Chicago.

HARVESTING.

If you do not use a grain-cradle, it can be mown carefully with a scythe. If not convenient to draw it to a thrashing-machine, a good way is to build an open rack of slats across a wagon-box. Some put the box on a sled, so as to have it low down. Drive into the field, and pitch a few forkfuls of buckwheat on to the rack, and hit it a few sharp blows with the pitchfork. The grain will rattle down into the box, when the straw can be pushed off, and a new supply put on. Two men can do this rapidly, and I have heard of good-sized fields of buckwheat being thrashed in this way.

B. HASSETT.

Howard Center, Howard Co., Ia.

EARLY AND SELF-SOWN BUCKWHEAT.

I have never sown buckwheat in April or May, but this I know: Buckwheat that comes up from last year's crop always fills well in this latitude. Only last week I was talking with James Mahary (a successful farmer) upon this very point, and he

said he never knew self-sown buckwheat fail to fill well, and that last year (a very dry one) he had a patch that would have made quite a crop had it been left to mature. I also find that many are more successful in seeding with buckwheat than oats or wheat. As I expect to sow 20 acres of Japanese buckwheat this season, at different periods, from early to late, I may know more about it next fall than now.

GEO. E. HILTON.

Fremont, Mich.

The above articles cover the whole ground, pretty nearly. Friend Kennedy, if I understand him correctly, suggests a plan of getting a crop of buckwheat without any extra expense, except the cost of the seed, and drilling it in; that is, the ground is prepared for wheat in July instead of at the usual time. Then after the crop of buckwheat is removed, the wheat is drilled in, without any further preparation of the soil. While such a course might occasionally give us as good a crop of wheat as if no buckwheat had been on the ground, I can hardly think it possible that it would invariably turn out in this way. It is true, buckwheat may take little or nothing from the soil that would be wanted for the wheat crop. Unless, however, the season were one where rains were very plentiful, I should feel quite certain that the buckwheat would rob the ground of some of the moisture needed by the wheat; at least, my experience has been that a crop of almost any kind takes the moisture from the soil to a much greater extent than where the ground is harrowed frequently, without allowing it to bear any crop at all. I once plowed under a heavy turf of very hard stiff wild grass. After turning over the sod I raised a tolerable crop of buckwheat. Thinking the sod was rotted and the grass dead, after the buckwheat was taken off I turned it over again, to put on rye. To my great astonishment, the grass that had been turned over more than two months before, started to grow almost all over the field; and after letting it lie all winter, and turning it over again, I had a hard time in breaking the sod up in the spring. From this I judged that a crop of buckwheat might be taken from the ground without the roots going down more than a few inches, and also without taking very much if any thing from the fertility of the soil.

Some allusion has been made in the articles above, in regard to breaking the grain in thrashing; and several have stated that a machine breaks the grain much more than thrashing by hand. Where it is tramped out by horses on a barn floor, much of the grain will be crushed if you are not very careful. I strongly favor the idea of raising the grain up from the floor by rails, or something of the sort, letting the grain rattle down through where it will not suffer injury by walking over the floor. I am inclined to think, also, that flails will do better execution when the grain is raised up on rails.

I think it is quite true, that black bees take to buckwheat honey rather more than the Italians do. Our best colonies for gathering buckwheat honey for several different seasons seemed to be hybrids.

DR. MASON STANDS UP AND EXPLAINS.

CAREFUL STATISTICS ON THE AVERAGE CONSUMPTION OF STORES DURING WINTER.

WELL, friend Root, I don't understand why you should single me out, and "order me around" as you have on page 61, where you say, "Doctor, stand up and tell us what you mean by such a statement as that." And you are reminded "of the man who brought home two stoves," etc. I can't see the relation my statement has to "two stoves." Perhaps it was pretty cold weather when you were bossing me around, or my statement may have had a cooling effect upon you. At any rate, I don't see why I should be ordered to explain.

Prof. Cook reports the average consumption of stores by his bees at less than mine, and then, as usual, you come out ahead, for you say, "Come to think of it, I have done even better than that." Perhaps I have done better than you; but as you don't tell just how much "a very small amount" is, you have a chance to come out ahead yet. I too "have seen a weak colony consume only a very small amount of stores during winter," and not be profitable during the following season. I have also had a fair colony consume but $3\frac{1}{4}$ pounds in wintering, and be a right royal one the next season, making as good returns as any. I have also had a good colony consume 20 pounds in the cellar, and starve to death before it came time to set them out in the spring. I am not the only one who gives two weights as the average consumption of stores, and just notice the difference!

H. R. Boardman, 25 to 30 lbs., indoors.

Mrs. L. Harrison, 9 to 10 lbs., in cellar.

" " 18 to 20 lbs., outdoors.

Dr. Miller, 20 lbs., in cellar; dead bees included.

Geo. Grimm, 15 to 20 lbs., in cellar.

C. F. Muth, 15 to 25 lbs., outdoors.

Mr. Elwood, 12 to 14 lbs., in cellar.

James A. Green, 18 lbs., outdoors.

G. M. Doolittle, 14 lbs., outdoors; 10 lbs., in cellar.

Prof. Cook, 7 lbs., in cellar; 14 lbs., outdoors.

James Heddon, 20 lbs., outdoors; 10 lbs., indoors.

A. B. Mason, 6 to 11 lbs., in cellar.

Muth, Green, Doolittle, Cook, and Heddon, outdoors? And Dr. Miller's colonies consumed as much or more in the cellar than did those of the others outdoors; for if Mr. Muth's figures were reduced to one number it would be 20 lbs., outdoors.

I believe Mr. Boardman knew just what he was saying when he said from 25 to 30 lbs., and I've been wondering if the others were not guessing.

Undoubtedly Mr. Boardman answered the question, from October to May. My answer was for the time the colonies were in the cellar, and I presume Prof. Cook's was also, as may have been some of the others. The question (102), asked in brief, is, "What is your average consumption of stores per colony from October to May? State whether for outdoor or cellar."

Messrs. Boardman, Green, and Muth, take less than a line to answer the question, and Messrs. L. C. Root, Dadant & Son, Grimm, and myself, take a line; Mr. Doolittle, a little over a line; Mrs. Harrison nearly two lines, and so on up; Mr. Heddon occupies eight lines. Now, friend Heddon, if this meets your vigilant eye, please just keep still, for I've got trouble enough on hand now, and don't want you to get after me; and if you will let me alone I'll give Rambler a blackboard exercise next spring on the "Pollen Theory" (if I feel like it). And, friend Root, if you won't let any one "pitch into me" after all this rambling, I'll tell you what I meant by my answer. It is this: Some winters the average consumption of stores by my colonies, while in the cellar, has been as low as 6 lbs., and sometimes as high as 11 lbs., and all the way between; but seldom over 9 lbs., and usually less than 8. Now, perhaps some "smart Elick" will want to know how I know what my colonies have done, and just as likely as not, I may have so trodden on your toes, Mr. Editor, as to set you to asking me some foolish questions, and ordering me around some more, but I'll just take the snap out of you by answering, before any of you ask, by giving you a sample sheet of my book-keeping; and let me say it is no small job to keep such a record; but "it is lots of fun," and comes right handy when such questions are asked, and "Rambler's" are to be educated. Remember, friend Root, I am to be let alone. Here is the sample.

No. of Colony	1886.	Weight, Oct. 6, 7.	No. of Frames.	Weight of Frames.	Spaces of Bees.	Weight of Bees.	Weight of Stores.	Weight less Stores.	Fed Oct. 7, 8, 9.	Should weigh Oct. 10.	Do weigh.	Should be Stores.	Are Stores.	Lost in Feeding.	Weight Nov. 13.	Weight of Stores.	Loss or Gain from Oct. 10 to Nov. 13	Weight March 20, 1887.	Spaces of Bees.	Weight of Bees.	Loss of Bees.	Loss of Stores.			
138	4	6	7-2	7	3-1	3-13	34	6	8	48	4	11-1	10	1	13	43-8	9	2	1	37	8	73	10	6	A space of bees weighs ounces.
265	9	12	8	9	9	4	21	438	8	59	12	21	4	21	49	38	820	14	4	20	Starved	4	20	A comb weighs 1 lb. 3 oz.	
356	6		8	9	8	4	18	837	8	0	56	18	8	18	8	57	19	8	17	83	8	8	9	8	A division-board weighs 1 lb. 6 oz.
			300				319	140-2386	14	25		538	13												A hive weighs 23 lbs.

Now, all the above names, except the last one, are among those of our most reliable bee-keepers. I can't imagine why you should question the truthfulness of my statement. Prof. Cook's average is less than mine. Why not ask him to "stand up" and explain? My average would be $8\frac{1}{2}$ lbs.; and Mrs. Harrison, Mr. Doolittle, and Mr. Heddon give only $1\frac{1}{2}$ lbs. more than I do, as their average.

If indoor wintering is such a saving, why not ask Mr. Boardman to "stand up" and explain how it comes that his colonies indoors consume more stores than do those of Mrs. Harrison, Messrs.

Average No. of frames per colony	71.
Average No. of pounds of bees	38.
Average No. of pounds of stores Oct. 10.	29.
Average No. of pounds of stores Fed Oct. 7, 8, 9.	6.
Average No. of pounds of stores there should be Oct. 10.	20.
Average No. of pounds of stores there was Oct. 10.	19.
Average No. of pounds of stores Nov. 13.	17.
Average No. of pounds lost in feeding.	1.
Average No. of pounds lost from Oct. 10 to Nov. 13.	1.
Average No. of pounds of stores lost in wintering.	8.
Average loss of bees in wintering	2 oz.

I don't give this as a model way of keeping track of wintering, but as my way, and to show that I knew just what I was talking about when I gave my answer. There is one item more that I wish I had kept, and that is the gain in bees in each colony

while in winter quarters. One item I have not transferred from my record, and that is the "Pollen Theory," for I *may* want to put that on my black-board in the spring for "Rambler" to look at.

The record from which this is taken is of 42 colonies, and I have given some of the footings to show how I do it. The figures given are for pounds and ounces; as, in first left-hand column, to the right of colony No. 1 the 38-4 means 38 lbs. 4 oz. In the sixth column from the right can be seen -1, -1-4,

1-, which means that colony No. 1 lost, or was minus, 1 lb.; No. 26 lost, or was minus, 1 lb. and 4 oz.; and No. 35 gained, or was plus, 1 lb. In the second column from the right is shown that colony No. 1 had as many bees when taken out March 30 as when put in Nov. 13. Not but that there was a loss of bees from the hive in winter quarters, for there was, but there had been enough raised to supply the loss, for they were breeding nicely when set out. No. 26 was - (minus) 4 lbs. of bees and 20 lbs. of honey; had a slight touch of diarrhea, and brood dead in the cells before hatching. No. 35 was - (minus) 8 oz. of bees. My hives are the eight-frame Langstroth size, and 11 of them were put in winter quarters with 9 frames in each, and had bees in all the spaces.

Eleven had 8 frames in each, and bees in all the spaces.

Seven had 7	"	"	"	"
Seven had 6	"	"	"	"
Four had 5	"	"	"	"
One had 4	"	"	"	"
One had 3	"	"	"	"

So you will see that they were not small colonies by any means.

Now, if your illustration of the two stoves saving all the wood will apply in wintering bees, so that, if *one* cellar saves half the feed, *two* will save it *all*, just send me another cellar, and send on your bees, and I'll winter them for you; and if you'll *remove all the "bee bread"* (sometimes called pollen) they shan't have diarrhea either. It seems the height of folly to winter outdoors when it takes, as you say, 30 to 40 lbs., and it takes from 6 to 15 lbs. to winter in a cellar or specially prepared repository. Look at our friend H. R. Boardman, whom you call "the man who winters his bees without loss," and justly too. He's got too much sense to winter his hundreds of colonies outdoors. And there is the Hon. R. L. Taylor, too, with his hundreds of colonies, who has too much of that same desirable commodity to practice outdoor wintering. And I might name scores of large and small bee-keepers who winter in the same way as do Messrs. Boardman and Taylor, and with equal success; and in this connection don't forget to include your humble servant.

I want to explain why I sometimes have so little stores in hives for wintering. It is enough to carry the bees through, and saves feeding sugar syrup, or good honey, and the honey I have on hand I don't like to risk to winter on; but as soon as set out in spring, the honey of poor quality can be fed in abundance.

Another thing: I believe it is pretty generally conceded, that an abundance of stores—that is, more than will in all probability be needed, conduces to breeding; and a goodly majority who have expressed themselves don't want their bees to commence rearing brood till set out of winter quarters. I have not been in the habit of putting bees in winter quarters before about Nov. 10, and have taken them out usually in March, or the first of April, so Messrs. J. Nebel & Son are right when, on page 127,

they say that I "may be correct also; likely not, from October to May."

I don't just exactly like your way of putting your question in your closing remarks on Question 102. You say, "Another question arises—Which is the more profitable—colonies that require from 20 to 25 lbs. to carry them through, or those that will get along on from 5 to 10 lbs.? Why not say, "Or those that require from 5 to 10 lbs.," etc., instead of "that will get along on 5 to 10 lbs.?" I have had some experience in this matter, and am satisfied, that, with me, it is not the amount of stores consumed that tells how profitable a colony will prove to be. Colony No. 22, whose record is in the table, a part of which is given above, was a good average colony, and consumed only 5 lbs. of stores, and was as good a colony as I had in 1887. No. 13 was equally strong, and had 5½ lbs. more in stores, and consumed 15 lbs. of stores, and was one of the poorest colonies I had the following season, and I could give plenty of such contrasts from the same table. J. Nebel & Son, above referred to, give about the same average I did, and add, "We think those numbers would be very near an average for ours. Only one colony consumed less than 6 lbs., and that one consumed only 3 lbs., and was a strong colony. Said colony did as well as any that season, 1886."

Now, friend Root, if there is any thing else you want me to "stand up" for, just "give me the wink" and I'll be on my feet as soon as possible.

Auburndale, Ohio.

A. B. MASON.

There, there, doctor, I will own up and apologize, and take back *every* thing I said. I supposed that you were going to leave me at least a little bit of a corner wherein to defend myself, and argue the point. Your array of figures, however, covering several years as they do, reminds me of the witness, who, when asked how far he stood from the fight, replied, "Just 14 feet 11 inches." There was a smile at his intense accuracy; and when asked how he came to be able to give the figures just to an inch, he replied that he expected that some blundering fool of a lawyer might ask that very question, therefore he took out his rule and measured it. To get right down to the real facts, we are exceedingly obliged to you; and I do not know but that we shall have to admit that there is certainly a great saving in stores by wintering in a repository, whether there is a saving of bees or not. It takes some pains and care to accomplish this saving in stores, it is true. Then the question arises, "How many of us are there who are willing to take this pains?" or, perhaps, "How many can succeed as well as you and friend Boardman do?" At present I prefer to have our bees on their summer stands—at least where they winter as safely as they have been doing for years past. Ernest may, however, conclude to adopt some other way. He seems to have managed nicely with one colony during this past winter, and it has been one of the mildest I have ever known. We are glad to know, too, that you have proved pretty conclusively that a good strong colony of bees may winter on a very small amount of stores—even so little as five pounds. Thank you, doctor; the "wink" will be forthcoming before a great many days, you may be pretty sure.

RATE OF FLIGHT OF BEES.

AN INTERESTING QUESTION.

PROF. COOK'S articles on entomology are very interesting to me. I believe he is doing a work for bee-keepers that no one else can do, and we owe him well-deserved gratitude. I see that in his article on the wings of insects, in *GLEANINGS* for April 1, he speaks of the rate of flight of bees, and says, "The bee flies often twenty miles an hour." I should like to have him dwell a little more upon this special point, as it has been a hobby of mine, and I have devoted considerable time during the last four seasons to experiments upon this very point. I have found the average rate of flight of bees to be twelve miles per hour, on trips of less than two miles: further than that, about ten miles per hour. Viewed from what data I have, I should say that the professor put the rate of flight too high. But perhaps he meant that bees often fly for short distances at that rate. I am well aware that the out-going bee flies swifter than the incoming, loaded bee, but as yet I have not been successful in finding the difference of speed. My experiments have been confined to flight from bait, and of course included the round trip.

WILLIAM E. GOULD.

Fremont, Mich., Apr. 5, 1889.

Your rate of speed must be very low, friend G. Prof. Cook's rate of flight, as recorded in his article, would seem to be rather an under-estimate than an over-statement, judging by the account of the experiment below. If Mr. Saunders' experiments were carefully conducted, then a bee *can* fly, under favorable conditions, 45 miles per hour—over twice Prof. Cook's rate, and four times yours. In experiments of this kind, the factor of wind, if blowing, and its direction with reference to the flight of the bees, should be taken into account. To make the experiment accurate, the air should be perfectly still. Will Mr. Saunders tell us the condition of the atmosphere at the time of his experiment? We presume, however, it was quiet, as it was toward evening.

ANOTHER RACE BETWEEN BEES AND CARRIER-PIGEONS; THE BEE DECLARED THE WINNER AGAIN.

In *GLEANINGS* for March 15 are a few remarks on bees vs. pigeons. I have some very fine carrier-pigeons; some of them have flown 400 miles in 12 hours, and many times have my birds been liberated in New York city, and reached Gloversville at noon, same day. In June of last year I sent to Johnstown, which is situated about four miles, air-line, or as a bird would fly, to Gloversville, six bees—four drones and two workers, and six of my best selected birds. They were all liberated at the same time, at five o'clock sharp, in the afternoon. The first bee arrived six minutes after five; first pigeon, ten seconds later; second bee, eight minutes past; after that, pigeons and bees came in so quickly one after the other that it was impossible to get correct time. The bees, on being liberated, took a perfectly straight course, as far as the eye could follow them; the pigeons circled in the air twice before they could see their home. This proves that bees fly more by instinct than sight, and pigeons by sight and observation.

I wish you would make *GLEANINGS* a weekly

journal. It is enjoyed much by us, and we are going to have it bound and put in our library.

A. C. SAUNDERS.

Gloversville, N. Y., Mar. 25, 1889.

The account of your experiment is extremely interesting; especially so as it substantiates the results of a similar experiment tried in Germany. From your experiment it is evident that a bee can keep up with the average passenger train, but it would seem not with the fastest-running train (i. e., at a speed of a mile a minute).—Thanks for your kind words; but if we were to make the journal a weekly, we could hardly illustrate or get it up in the style we now do.

In addition to what Ernest says, I wish to express my surprise that the bees got home at all, after having been carried four miles. In bee-hunting I have frequently carried bees with the bait so far from their home that they scattered, one in one direction and another in another, and seemed to be entirely lost as to the direction they should take, and we did not carry them four miles either. I should be glad to hear from others who have had experience in bee-hunting—any who may have made the experiment in carrying bees dusted with flour, or painted, some distance from their hives, in order to let them go back. Very likely friend S. had his bees so well marked there was no possibility of a mistake. If so, he succeeded better than I should have expected.

A BEE-HIVE ON SCALES.

HOW IT MAY BE OF BENEFIT TO THE BEE-KEEPER. TABLES OF HONEY YIELDS.

THE following excellent article from the pen of A. E. Manum, we take pleasure in copying from that spicy little journal the *Bee Hive*:

How many pounds of honey will a swarm of bees gather in one day? is a question that has often been asked. With your permission, Mr. Editor, I will endeavor to give the public my experience, through the columns of your practical little *Bee Hive*. For fifteen years I have kept a swarm of bees on scales in each of my apiaries, during the summer. Not only for the purpose of knowing how much honey a single colony can store in one day, but to assist in determining just what the bees are doing, from day to day, I deem it very essential that I should know just how much honey is being gathered each day, not so much for the pleasure of having a record to refer to in the future, but to serve as a guide by which to govern my operations during the honey-harvest.

Those who have never kept a hive on scales can not estimate the advantages to be derived by such a practice. We not only have a brief record to refer to in after years, but we are enabled to judge very correctly every day what the bees are doing, and also know, to a certainty, when the honey-flow begins, when it is at its height, and when it is drawing to a close. The amount of honey that a colony will gather in one day, I find to vary greatly in different localities. I find that apiaries located only three miles apart vary in the amount of honey stored in each. The condition of the weather has much to do with the amount of honey that will be gathered each day, as a few hours of unfavorable weather in the middle of the day will make quite a difference with our scale-hive record. Hence the apiarist must take the condition of the weather into account, and be governed accordingly in making his calculations. I have observed that, in a season when the atmosphere is well charged with electricity, and when electric shocks are frequent, honey

will be much more abundant than when electric shocks are less frequent.

When the lightnings flash and threaten our lives,
The bees will be sure to fill up their hives.

By the use of scales we are enabled to ascertain the value of the different plants from which come our surplus. I deem it very essential that we should know this, as I find there is a great variation in the amount of nectar secreted by honey-plants in different localities. For instance: Clover may yield abundantly near the home apiary, when three miles away, but little honey will be gathered from that source, although the bees in the out-apiary may appear to be working lively; when, by consulting the scales, we discover that but very little is being stored there, when if we had no scales to indicate to us the scarcity of honey in that vicinity, we should be at a loss to know why the sections are not being filled as fast at this out-apiary as at home. It is but very little trouble to prepare a scale hive. Simply set the scales level both ways and place the hive on them, and prevent swarming if possible; and every morning, early, balance the scales and record the gain, or loss, for the past twenty-four hours. I use common cheap platform scales, that cost but \$3.50 each. It will be seen that there are many advantages to be derived by the use of scales in the apiary. I would not think of running an apiary without having a colony on scales; and if I had twenty apiaries, I would have twenty sets of scales, one set for each apiary. I give the records of two seasons, to show the difference in the length of time bees have to gather a surplus here in Vermont.

Season closed.

It will be seen that in 1875 there were 31 days in which there was a surplus, while in 1885 there were but 18 days in which there was any gain, though in 1885 my surplus was all gathered in 12 days, the rest being stored in the brood-combs. A. E. MANUM.
Bristol, Vt.

There is one thing that surprises me in the above report, and I am still more surprised that neither yourself nor the editor of the *Bee Hive* seems to think it any thing remarkable. In 1875 your best yield in a single day was 20½ lbs. This is remarkable; but when we read that, ten years later, one colony made 33½ lbs., in a single day, we begin to think your bees must have gained skill and wisdom, as well as yourself, during the ten years past. May be I have forgotten, but I do not remember any such report of one hive in one day since the time of friend Hosmer. You must have a wonderful basswood pasturage in your vicinity. I

think I might almost promise to make a trip to Vermont to sit down beside a hive of bees and see them "lug in" even 30 lbs. of honey between daylight and dark. Please tell us, will you not? something about your wonderful basswood pasturage. I once had a colony that made me a clean 10 lbs. on clover during one day, and that day was Sunday too, so I could watch them a great part of the time—at least I did in those days, years ago. In 1885, however, the best that clover could do was 3 lbs. We hope clover has improved with you since then. If using white poplar for sections in your vicinity has been the means of sparing the basswood, you have still another reason to thank God for white poplar. Your figures above teach us another lesson: If basswood is to be cut down, and no more be planted, at the rate it is now going it will be almost the ruin of bee culture. How much profit would you have had during the two years given above, without basswood? Is anybody planting basswood orchards but myself? Ours is big enough now so that Ernest is talking of locating an apiary right near the basswood orchard. He has bought a pony already, to ride back and forth—so much toward the enterprise.

DOUBLING IN TEN DAYS.

THE MERRY HUM OF SWARMING AND OF INCOMING
LADEN BEES; THE BOY BEE-KEEPER, AGAIN.

WE had almost drifted out of the brotherhood since leaving the merry hum of a hundred colonies of golden Italians at the old homestead in romantic Georgia; but this season finds us again in the ring. In addition to our individual interests, a near neighbor with four colonies of good Italians insisted on turning the same, as they stood, into our hands. These bees were in single-story Langstroth hives, and stood on their winter stands, without having been so much as examined this spring, when we took charge, and one had swarmed and fled to the woods. Ten days thereafter we had increased, without the use of foundation, to eight colonies; and to-night, at the end of the thirteenth day, we have here nine full colonies and two two-frame nuclei with queens. We have taken about 25 pounds of comb honey, and some of the hives are literally packed with honey to overflowing, as was one of the original colonies when the tender comb fell down and two-thirds of the bees were drowned in the honey. In consequence of this disaster this colony has played little part in our increase. To begin with, we made an artificial swarm from one colony, giving three frames of brood and six empty frames on the old stand; in ten days they sent out a good swarm from a full hive, and retained a lively young queen. Of course, these bees had plenty of brood and workers to commence with; but they have "got there, Eli," at a lively rate, and it takes our best to keep them in the hives, as they have the swarming mania worse than any thing. The "Boy Bee-keeper" is again with the A B C class; but when it comes to a spring run and a big honey-flow, just pass us the cake. We think some of Bro. Root's colonies could score 100 pounds in any ten days this spring, if he'd just send 'em down here. CHARLIE R. MITCHEL.

Ocala, Fla., Mar. 30, 1889.

RAMBLE NO. 16.

THE RAMBLER TELLS SOME CURIOUS THINGS; USING A VIOLIN TO BRING DOWN SWARMS.

THE inauguration of a new president, and the retirement of President Cleveland, reminds the Rambler of a very pleasant visit with Mr. David Cleveland, of Pawlet, Vt., a distant relative of the ex-president. A large transferring job was to be done; the Rambler's aid was solicited, and in a day of lively work nearly 30 swarms were changed from old box hives to the regular Langstroth, and Bro. Cleveland was made happy. Mr. C.'s apiary is located among the splendid hills where a never-failing supply of honey is sure to be secreted. We found him to be a man on the shady side of 60, and a mason by trade. The usual hardships of life had given him a stooping form and a more aged appearance than he rightly should assume. We found that one of his crosses was a bed-ridden daughter, who seemed to be a counterpart of Anna Quillin. Miss Cleveland had not been from her bed for several years. Physicians said her disease was incurable; but the advocates of the Faith cure gave him hope again, and, behold, in due time she arose and walked the earth again. All hoped that she would become permanently strong; but, like the most of such cures (?) that have come to the Rambler's notice, it was not permanent; and after a few weeks of freedom she was again doomed to the narrow limits of a bed.

We here first learned of the existence of a "shut-in society," or a society of invalids who keep up a system of correspondence and exchanges. We were surprised to find specimens of rare plants from the tropics, and many things curious and instructive from remote parts of the country. We rejoiced with the invalid for that splendid institution, *Uncle Sam's mail-bags*.

Mr. C. gave us interesting facts in relation to other bee-keepers in his vicinity; and thinking a holiday among them would recreate him as well as interest the Rambler, later in the season we called upon Mr. C. It was at the twilight hour, and we found him mounting guard. A portion of his grounds are set out to grapevines. The boys from

NIGHT VIGIL AT THE GRAPEVINES.

a neighboring village are so immoral as to steal our friend's grapes. To protect them while ripening, for several nights he guards them with shot-gun in hand. His intentions, however, were not blood-thirsty, as he meant only to scare the intruder.

The next day we called upon several bee-keepers,

and among the most extensive was Mr. Cross Lincoln, of Rupert, Vt. The first thing we noticed about Mr. L. was his very pleasant appearance, giving a direct contradiction to those who have given him the name Cross. It beats all what misnomers people will tack on to a fellow sometimes. At the time of our visit, Mr. L. had nearly 200 colonies, and his honey-house was filled with as nice an exhibit of comb honey as the eye of a bee-keeper could look upon. Here for the first and only time in our life we saw 3000 lbs. of comb honey in half-pound sections, all crated and ready to ship to the Boston market. Mr. L. claimed that just as much honey could be obtained in these small sections as in larger ones, and that 2 cents per lb. more could be obtained for honey in this shape. They looked so fascinating that the Rambler wanted to get right home and prepare to run all of his colonies for half-pounds; but in correspondence with Mr. L. since, our ardor is dampened somewhat by his saying that he will return to the use of one-pound sections. Mr. L. combines potato-buying with bee-keeping. The potato-trade coming in the fall and spring, it does not interfere with the bee-business. His bees are wintered in a small cellar. The space is packed as full as it will hold, and the temperature must necessarily be very high. The only ventilation is a tube through the cellar window.

It seems to run in the Lincoln family to keep bees. An older brother, we believe Mr. Homer L., has the honor to belong to the fraternity, and his combination of other business is quite novel. Besides bees he gives his attention to fox-hunting and fiddling. During the winter months his violin is heard upon many a festive occasion, far and near. During the swarming season, when the bees are upon his mind, his violin, we are credibly informed, is used to a great extent. It is said, that with a violin you can strike a key-note that will vibrate down an iron bridge. It is also said that the walls of Jericho fell from this striking of a key-note between the rams' horns and the wall. So in this case, Mr. L. with his violin strikes the key-note of the swarm, and every bee drops to the ground. It is better, however, not to bring them all down at once. Some slow tune like "Old Dan Tucker," where the key-note is often struck, will cause them to alight in short order; and Mr. L. loses no swarms by absconding, so he says. The Rambler never saw Mr. L. do this wonderful feat; but if any violinist has doubts about it, let him try it next swarming time.

STRIKING THE KEY-NOTE OF A SWARM.

After a very pleasant day, which Mr. Cleveland also seemed to greatly enjoy, the Rambler set his face toward the spot where the sun went down; and after a few hours' drive he arrived at the Residence of Stephen Carpenter, the Quaker giant bee-keeper of Granville.

THE RAMBLER.

Friend R., please have plenty of charity for the advocates of the Faith cure. The inspiration and excitement attendant upon almost any thing which is novel, especially if it arouses the interest and enthusiasm of

the patient, is pretty sure to have a beneficial effect. If this interest and enthusiasm is also in a line with something good and praiseworthy, I think the chances are much better for success, and we should by no manner of means ignore the fact that a loving faith in the strong arm of the Almighty can never be a mistake. Mrs. Axtell's wonderful recovery was the result of faith in God, her love for the honey-bees, and a new ambition and enthusiasm that helped her as nothing else could, perhaps, to get out into the sunshine and open air. If Miss Cleveland has not had an account of this through GLEANINGS, we want you, friend R., to see that she does get it.—I have often heard that a violin would shake an iron bridge, but I never had an auricular demonstration of the phenomenon until I heard that roar in the Moniteau grand cavern I told you about.

THE ITCH AND FACE MITES.

PROF. COOK TELLS US SOME IMPORTANT FACTS ABOUT SOME "INTIMATE ACQUAINTANCES."

I AM requested by a subscriber to GLEANINGS to illustrate and describe these hateful pests. As these detestable miners practice no nice discrimination that causes them to leave bee-keepers out of question in their quest for forage, every bee-keeper is interested in their structure, natural history, and mode of life.

Mites belong to the spider—sub-class *Arachnoidea*—and so have eight legs, simple eyes, well-developed mouth-organs, but no antennæ. They belong to the mite and tick order, *Acarina*, and so are a mere sack with legs and mouth-organs appended (see figures). That is, unlike true spiders and scorpions, they have really only one part to the body—no distinct head or head-thorax. Mites are also peculiar in having six legs at first and eight when mature. All others of this sub-class have eight legs from first to last.

This mite order is a very extensive one, and the species included are very variable in their habits. Thus we have the cheese-mite and the sugar and flour mite, named from the substances which they infest. These mites are mere specks, though when very numerous they make these important food articles quite lively. As they are small—so small that they are usually overlooked, yet often the sharp-eyed housewife discovers them, and is very much disgusted; for howsoever pleased she may be to see her flour "rise," she is not pleased to see it walking off.

House-mites are black and red species—mere specks—which often gather on windows and under carpets in such prodigious numbers as to be incalculable. These are often seen, and I have received inquiries regarding them many times, and from many States. They are harmless, except for the discomfort arising from the presence of such vital specks in our homes. Many mites prey upon insects, which they destroy. Thus we are freed by mites from some of our worst insect-enemies. Other mites prey upon poultry, and do great mischief. Free use of an ointment made of kerosene and lard soon frees the poultry-house of these annoying pests.

The red spider is another kind of mite which

works in greenhouses, and, when the atmosphere is dry, on outdoor plants. Plenty of water sprayed upon affected plants quickly puts these vegetable-destroying mites to rout.

The phytoptus mites are a very minute, long, slim, four-legged species that also attack leaves of trees like maples, basswood, etc. These form teat-like galls on the top of the leaves, and were described and illustrated by me in GLEANINGS two or three years ago. So far as I have observed, they do no very serious harm. A silver-leaf maple in our old apiary was covered with these phytoptus galls for years, yet the tree continued vigorous and healthy, and made exceptionally rapid growth each year. Wood and cattle ticks are gigantic mites that often do serious harm, as horses are sometimes killed by their attacks. I will illustrate and describe these jumbo mites at some future time.

FIG. 1. ITCH-MITE GREATLY MAGNIFIED; VENTRAL VIEW.

The itch-mite (*Sarcoptes scabiei*) as seen in Fig. 1 is very small, really microscopic, and has a disgusting habit of burrowing under the skin in the angles at the bases of the fingers, where it causes disgusting pustules. The irritation causes an itching sensation

which gives rise to the name

"itch," applied to the disease caused by these microscopic mites. The old name, seven-year itch, shows how hard it was in old times to exterminate this enemy. Nor do I need to say *old* times, for within a short time a young man came into my laboratory with very suspicious-looking hands. He was a nice, neat young man too. I said, "What ails your hands?" He replied, "I wish you could tell me. I have had this trouble for four years"—more than one-half of seven—"and have consulted two or three physicians. Not one can tell the trouble or help me." I took a scalpel, picked away a moment at one of the pustules, placed my "find" under the microscope, and showed him a plump itch-mite. He was ready to dance with joy when I told him that a little mercurial ointment, or an ointment made of lard and kerosene, would at once rid him of this plague. Isn't it a sorry compliment to our physicians that they can not rightly diagnose and cure this itch-plague? Or, rather, is it a compliment, perhaps, to our civilization, that itch is so scarce that our "M. D.'s" have no chance to study the malady, and little occasion to examine and treat it?

The face, or pimple mite, *Demodex folliculorum* (Fig. 2) is a long slim mite that bores into the skin, causing pimples. This mite is

FIG. 2. PIMPLE OR FACE MITE GREATLY MAGNIFIED; UNDER SIDE.

even smaller than the itch mite, $\frac{1}{30}$ of an inch long, and burrows in the hair-glands. It finds a favorite lurking-place and feeding-ground along the nose, It has been said, that one person in every ten has

bors these pimple mites. They are hard to exterminate, but, fortunately, they do little harm except to mar the fair face of beauty. Possibly in humbling pride they may be a disguised blessing, proving Shakespeare's paradox: "Sweet are the uses of adversity."

These two mites, if we except the old wood-ticks, are all that attack man. In another article I will describe the Texas cattle or pony tick, and then speak more fully of the old wood-tick which formerly, before the forests were cleared away, were far more numerous than now. A. J. COOK.

Agricultural College, Mich.

Well, I declare, friend Cook, entomology did do good service for once, didn't it? I wish I could have seen your face when you demonstrated by science the problem the doctors could not grapple. Now, I tell you I believe in that sort of medical education. When we learn to chase out disease as we would chase out rats and mice, we are at work with a solid rock under our feet. I am a little surprised to know that live animals really burrow in the skin of the face. I have heard this contradicted so ably that I had decided it was only a piece of superstition. I trust they are not very common. How about pyrethrum for these minute animals? If one had the itch, would not pyrethrum, rubbed thoroughly into the skin, have the effect it does on all other kinds of insects? I have heard my father tell about wood-ticks when he used to work in the clearing around our log house in the wilderness, and therefore I am much interested.

SUPERSEDING DRONES, AND DRONE COMB.

DR. C. C. MILLER TELLS US SOMETHING OF SOME SENSIBLE METHODS OF DOING IT.

IF there is no interference on the part of the beekeeper, an unprofitable number of drones will be raised. It is supposed by some, that, for the best success, each colony should be allowed to raise some drones. I never saw any reason given for this, and I suspect there is no kind of need for any drones, except as many as a single colony will raise, even in a good-sized apiary. Perhaps if the matter could be fully controlled, the best way would be to have not a single drone raised, except in one colony, and that the best in the apiary, and to raise no queens from that colony. But with all the pains that may be taken, there are likely to be drones raised in nearly every colony. Even if you fill a hive with worker foundation, the bees will build some drone-cells. Not many, however, but from year to year the amount of drone comb is likely to increase on account of the bees filling up with drone comb any hole made by mice or in any other way. It will pay to look this matter up annually, and make the effort to prevent drone comb in all but the one colony.

A good time for this is in the spring, when the combs contain the least honey. If you find holes in the combs you may be pretty sure that, if left to their own sweet will, the bees will fill it with drone comb. To prevent this, fill it yourself with worker comb or worker foundation. Take one of the combs that has in it a good deal of drone comb, and cut it out of the frame to patch other combs with. Then cut the drone comb out of another frame; lay this

frame over the comb to be used for patching; mark with your knife the shape of the hole on the under comb, then cut out the piece and crowd it in the hole and the bees will do the rest. If the frames are wired it may be better to use foundation. Cut away the cells around one side of the hole, so that the septum shall be bared about the margin for perhaps a fourth of an inch, and press on this a patch of foundation, preferably somewhat warm. Let me remind you, that, if left alone, the combs will gradually have a larger and larger percentage of drone comb, and that it is not likely any hole will ever be filled by the bees with worker comb, and that every square inch of drone brood not only takes the place of a larger amount of honey, but that these drones, when hatched out, make heavy drafts on the stores brought in by the workers. I think Cheshire has estimated that each drone raised means the loss of about three times its weight of honey; but I may be wrong about this.

While you are at it, let me call your attention to another thing to notice, as you look over the combs. I do not remember to have ever seen it mentioned, and it is quite possible some of the veterans may be glad to have their attention called to it. When extracting our honey, if the emptied comb is examined there will very often be found cells a quarter, an eighth, or even a sixteenth of an inch deep—possibly a patch of several square inches of such cells. They have been made in this way: In moving the combs they have been so placed that two sealed surfaces have been placed together, but so far apart that, when the bees have been increasing their store room, they have built cells on top of the capping; and when the comb was taken from the extractor, the honey still remained under the lower surface of the capping. So far you have noticed this. Now, did you ever notice that the bees never uncap this lower capping? Even if rudimentary cells have been begun on top of the capping, in which not a drop of honey has ever been put, nor could be put—so shallow, indeed, that ordinarily it would hardly be noticed—all the honey that is under the capping in such a place might just as well be so much lead so far as the bees are concerned. I put a comb containing such honey, last fall, out in the open air, at a time when the bees were inclined to rob. Not a drop of honey was taken from it. If, in the course of time, as much as a quarter of a pound of honey should thus accumulate in each comb, it would be a matter of some moment. So whenever you see these shallow cells, punch a hole in the bottom, which was originally the capping, and the bees will tear out this false bottom. If the surface of such cells is considerable, cut away and uncap it. C. C. MILLER.

Marengo, Ill.

Friend M., I have done exactly all you mention, and have observed all you speak of, and I believe that my conclusions were just about the same as yours. I never saw very much honey left in the comb, however, because of this intermediate capping, and the robbers in our vicinity would certainly have found it in time. I have known them to chew up a comb and pack it on their legs and carry that off too. The chaps that carried off the comb, however, might not have been positive robbers. I have seen colonies get along apparently well, even after I had removed every cell of drone comb; and it

certainly makes a very great difference in the yield of honey, this getting rid of drones entirely, when none are wanted.

ORNAMENTAL HIVES.

LEVI STOVER'S TENEMENT HIVE, AND HOW IT LOOKS AFTER COMPLETION.

SINCE the publication of the sketch of the tenement hive, March 1, 1887, I was frequently reminded that other bee-keepers were interested in ornamental hives, as I received letters from different parts of the country, asking for further description. For the benefit of other bee-keepers who have time or taste for the ornamental part of bee-keeping, I send you a photograph of the hive. There are four colonies of bees in it, doing well, but not any better than in single hives. The spire is fastened with hinges, and is used to store chaff cushions in the summer. For a contrast, the straw skep was placed in the foreground while taking the picture. It was made by my father, 64 years ago, when 19 years old. He is still living, and also keeping bees. He has had from two to twenty colonies since his boyhood, but his bees are still governed by a "king."

Brookville, O., April 25, 1889. LEVI STOVER.

SIXTY YEARS AGO AND NOW, SIDE BY SIDE.

CELLAR WINTERING.

FRIEND DOOLITTLE THINKS DAMPNES AND CLAY SOILS NOT NECESSARILY DELETERIOUS.

IF this article is a little out of season, I hope the readers of GLEANINGS will excuse, for I feared that, if I did not give it now while it is fresh in my mind, it would never see light at all. I see, on page 296, that Prof. Cook thinks that a bee-cellar in sandy soil is better to winter bees in than one in clay soil, and that you, Mr. Editor, agree in the same thought. Well, this may be so; but I wish to say that no one need be debarred from wintering his bees perfectly in a cellar, even if the soil is the worst kind of a clay. The soil where my bee-cellar is situated is of a mixture of clay and what we call "hard-pan," the same holding water even more tenaciously than all clay, if possible, yet my bees have all come out in the very best condition possible. There has been so much moisture in the cellar the past winter that it has stood in drops all over the roof on the inside nearly all the time; while on the door, which is painted, it has run down so as to stand in puddles at the bottom. Besides this, mold has formed about the sides, so that some handsome specimens have reached the length of two inches in the center, while the base of some of the largest patches is six or more inches in diameter. Now, I feel almost like asserting that dryness or dampness, ventilation or no ventilation (except that which will pass through the surrounding surface), has nothing to do with the bees wintering well, but that the whole thing rests on the right temperature. I can not see how the professor's cellar should be so cold unless he has a room above it.

Nov. 5th I commenced to place my bees in the cellar, putting in a few each day till the 11th, when all were in. A week after this, the temperature in the cellar stood at 45°. It very gradually lowered, till, on the middle of January, it stood at 42½°. Here it stood till about the middle of March, when it gradually rose, so that, on the 10th of April, it stood at 45° again. On the 15th of April I commenced to put the bees out, putting a few out each day when the weather outside was right, till the 24th, when all but eight were out. It now came on rainy and cool, so that, as I write, the eight are still in the cellar. Although we have had the mercury as high as 82° in the shade during this month, and I have had the doors open to a certain extent while carrying the bees out, still the thermometer has not been above 45° in the cellar after the same had been closed an hour after setting bees out. I have just been to the cellar, and find all just as I have described above, with the bees in the eight hives still remaining as quiet as they were last December, and occupying from five to eight ranges between the combs. In one colony, nearly a pint of bees hang below the combs; and after watching them quite a while I failed to see one of them stir a single bit till I breathed on them, when they readily told me that they were all alive. As these colonies that are still in the cellar are those that were set in first, it will be seen that, when five more days pass by, it will be just six months since they saw the light of day; and yet if damp and moisture are detrimental to bees wintering, and if they can not winter without special ventilation, they should have been dead long ago. An examination of those set out of the cellar shows that

they have not consumed half of their stores, and also that scarcely a bit of brood has been reared, although all colonies have a few eggs when first brought out. One or two had some hatching brood, but so far I have found no larva in a single hive. Some of the colonies first set out now have brood in all stages possible for the length of time they have been out, being fully up to the best colonies wintered outdoors along this line; and I suspect that those that are in the cellar would have been better off had they been set out when the first were, yet I can tell better about this when the basswood comes to blossom.

While Prof. Cook reports that he has had to keep an oil-stove in his cellar to keep it warm enough, I see many reports where the unusually mild winter has caused bees in cellars to become uneasy and winter poorly, besides making the owner a "thousand sight" of work opening windows and doors nights to keep the temperature down. The professor speaks of my loss when using an oil-stove as if he does not know how to account for it. Well, the difference was, that, while he maintained the temperature in his cellar at 40° as near as might be, I kept mine that season at 50° and above. Some have claimed that the oil-stove caused the trouble with me, but I have always claimed that it was the high temperature.

I now wish to say a word or two in regard to hibernation. As all will see by what I have written above, my bees that were in the cellar "hibernated" the past winter, if bees ever do such a thing, and that they are at it yet as much as they have been at any time, in the case of the eight colonies now in the cellar.

Well, some of the hives placed in the cellar were chaff hives, and in one or two of these hives those large black ants, which have been seen by nearly all in old partially decayed trees had made a home during the past season. One of the hives infested with these ants chanced to go into the cellar, from which I had taken the sawdust cushion, and I looked at the bees at least half a dozen times during the winter, I not knowing that there were any ants in the hive, or, rather, in the chaff packing. On the 18th of April I noticed that these ants were out around the hives that were outdoors, which were the first I had seen for the season. On the evening of the 20th I went into the cellar to fix for carrying more bees out the next day, and I heard a continual "zeep, zeep," from the bees in a certain part of the cellar, which was something I had never heard before in that place. By listening I soon found the hive it came from, and upon raising the sawdust cushion I saw twenty or more of those large ants, with their heads under the quilt over the bees, trying to catch hold of the bees which were uttering these notes, and trying to drive the ants away. Now, the question is, as the temperature of the cellar had not changed in the least for several days previous, and but very little during the whole winter, how did these ants know when to wake up at the same time those did which were outdoors, and why were the bees in all of the other hives as quiet as they ever were, being so still in the eight hives which remain? All know that I do not believe that bees hibernate, while I know that this species of ants do; yet it would seem that the temperature has little to do with the hibernation of these insects, while it has all to do with the quietude of the bees. Who can tell us more about this

strange suspension of life, and the power of taking it up again at will? G. M. DOOLITTLE.

Borodino, N. Y., Apr. 30, 1889.

In regard to the ants, friend D., I have seen them frequently in their dormant state; but they always came out of it when the temperature was raised sufficiently. I do not know whether disturbing ever roused them up without lowering the temperature or not. Perhaps Prof. Cook can tell us. Now, bees at a certain temperature, where they have rest and quiet, assume a state apparently much like that of the ants; but they are roused by a jar, or even by breathing on them, as you mention, and that, too, without any change in the temperature. Another thing, the ants, while in their dormant state, consume no food at all—at least I suppose they do not, and I presume they may remain in that dormant state for six months—may be longer. So far as I know, bees consume food—at least it is my impression they go to the stores and fill up once in, say, three or four days. To tell the truth, however, I do not *know* very much about it positively. Who does? When a bee is once filled with honey, how long can it live if the temperature remains favorable?

MRS. HARRISON'S LETTER.

BEE CULTURE IN DENMARK.

FOR a fortnight past I have been visiting some nephews and nieces, lately bereft, in the village of Granville, Ill. While there I visited Peter Dahl, a Danish bee-keeper, born on the island of Bornholm, in the Baltic Sea. This island is about thirty miles long, and from sixteen to eighteen miles wide. It furnished us a number of hardy soldiers during the rebellion, among them the subject of this sketch. In answer to my inquiries, with reference to bee-keeping on his native heath, he said there were no bees kept in towns and villages when he lived there, but all the farmers had some, with very few exceptions—hardly any but that had bees. The house, stable, and out-buildings were all built around a square, and this yard was paved with stones. These farm-buildings were so constructed, being built of stone and long rye straw, pounded down and covered with pitch, as to last for hundreds of years. On each side of the door that opened into this paved yard were two benches for bee-hives, right under the windows. There was a stone fence built around these benches. When the bees swarmed they were put into a straw skep and placed upon the bench. Then they were plastered around the bottom with mortar made of clay, leaving only a very small entrance for the bees. This was done to keep out a beetle with two pincers, and had a tail. Mr. Dahl has never seen any in this country, and does not know what harm these creatures did to the bees or honey; but the plastering was done to keep them out. In the fall the hives were all lifted, and the very heavy and light ones taken up, while the medium ones were preserved for another year; never more than four were kept over. There was no arrangement for securing surplus, and no comb honey was used. The honey was pressed out; and if any was sold it was by quart measure.

Bees gathered honey from the bloom of apples

and pears, which did well there; from white and red clover, flax, mustard, and heather. There was a sandy tract in the center of the island, which belonged to the king, and here is where the heather grew, and every family was allowed one load of it to kindle fires.

Mr. Dahl showed me a bee-book in the Danish language, but all I could interpret was occasionally the name of Dzierzon. He says he knows one person on the island who now uses frame hives.

Peoria, Ill.

MRS. L. HARRISON.

MRS. HILTON'S LETTER.

CALIFORNIA, AND SOME THINGS IN GLEANINGS.

I FELT sure that you would not feel satisfied with the short visit that you made to our beautiful land, so I was not surprised to read that you were coming again. You would have enjoyed a visit with Uncle James Gilchrist, at Montecito. I know I did when we were at his place, and may be we then can have the pleasure of seeing you and your wife. I did not expect you on this last trip, for I felt that you would have to be more than mortal to see half you ought to in the short time you allowed yourself. Don't leave Huber behind when you come. When Mr. H. read that piece where you quote "Beulah Land," I had to smile, for that is what I sing when upon a mountain. It is so appropriate, I find myself singing it before I think. I do not see how that man killed those tarantulas with chloroform, for I tried my best one time to dispose of one so as to have a fine dead specimen. I put a tumbler over it, wet a large piece of cloth with good chloroform, and shoved it under the tumbler with a knife, and left it all night. The next morning Mr. T. was as lively as ever. Then I wet the cloth three or four times during the day, but it would not give up, so I had to kill it another way.

Did you ever have your credit too good? Ours is, or was this spring, any way. We wrote to a dealer in San Francisco to know if there were any sweet potatoes in market, and at what price, as we wanted 100 lbs. for seed. In a week our station agent informed us that there was a sack of sweets at the depot, waiting for us. Now, we had been sold once before on sweet potatoes by having them shipped in a sack, after paying a fancy price for them, and we did not have any hot-bed ready for them; so imagine our feelings. Of course, they were badly bruised and rotting; so if we get 100 plants under the circumstances, we shall think we are lucky. The dealer thought he was doing us a favor to send them immediately, and we shall not let him know any thing to the contrary. But what I want to make out after this long preamble is, don't ship sweet potatoes in any thing that they will get bruised in, or customers will pay dear for their seed. We enjoy the agricultural department of GLEANINGS very much, also Rambler's letters, and—but, what is the use of specifying, for we read the whole thing from beginning to end, and think each one better than the other? Of course, you know by the large list of subscribers that you furnish a good article; but may be you are like our minister. I thanked him for the excellent sermon he gave us last Sunday. He looked at me in surprise a moment, and then said, after drawing a long breath, "Did you like it? Well, I am like one of our bishops. He said he had to have a word of praise once

in a while, to keep going." I had to laugh a little, as it is hardly decorous to clap our hands in the Lord's house when the minister gives a good thought. I have always felt that we should give a word of praise after the sermon. But I, as well as others, am something like the little girl that was chided by her mamma for not saying "thank you" for something she had received. She said, "I did say thank you." "Why, no, my child; I did not hear you." "Well, I said it, any way, down in my heart." MRS. J. HILTON.

Los Alamos, Cal., April 11, 1889.

Yes, Mrs. H., we have had considerable of such experience as you mention, with the sweet potatoes. Where a dealer is overstocked, and very anxious to get rid of his stuff, he sometimes ships it to parties who simply make inquiries. He should, however, always state that the goods are sent on approval, and if, in so doing, any thing is not perfectly satisfactory, he will make it so. I think you should have told him just the state of affairs, and let him bear at least a part of the loss. We have sometimes sent goods in that way, when customers mentioned that they were greatly in need of them; but where goods are sent without a positive order it very often makes trouble. —I think your minister is exactly right in the point he makes. It is words of encouragement that stimulate us to try still harder in speaking or writing; and without that, I doubt if anybody could do his best. When the work is in the line of bringing souls to Christ, kind words act like inspiration. I am glad you like "Beulah Land."

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

HUMBUGS AND SWINDLES.

THE Golden bee-hive man took in this county last winter, and sold the right to two gentlemen for \$100, who, hearing I was interested in bees, came to see me. It was a terrible old box. I told them I should like to have some to set hens in. They had a lot of circulars and testimonials, among others one from Prof. A. J. Cook, saying he had taken, if I remember right, 200 lbs. of honey from a Golden hive, which I told him I did not believe. Of course, I did not blame these gentlemen. They were persuaded to buy the right, and knew nothing of bee culture or beehives. I think they told me they had never seen a bee-journal. I gave them the names of several. The man who duped them was a Tennessean. I have forgotten his name. A. R. KILLINGSWORTH.

Red Lick, Miss., April 16, 1889.

Friend K., if you will look in GLEANINGS for Sept. 15, 1888, p. 693, you will find that we published an extract from the circular you mention; and at a later date, see page 767, Oct. 1, 1888, you will notice Prof. Cook's statement that he never used the Golden hive, and never wrote any such statement. It is a point-blank forgery, and the men who go around distributing such circulars should be arrested. I hope you will show them the numbers of GLEANINGS that I have referred to, as well as this one.

We will send them wherever you direct, free of charge.

C. C. MILLER DISCOURSES FURTHER ON THAT HIVE-STAND; A CORRECTION.

I'm sorry the picture in May 1st GLEANINGS shows the bottom-boards of my stands projecting. I'm not good at making pictures, and didn't know how else to show where the boards were. But there is no need of my stands projecting beyond the hive, and, as a matter of fact, they do not. Sand or sawdust closes up every thing about your stands, and that feature I like. I know no reason why it could not be applied just as well to mine, and then I don't know of any advantage yours has, while mine has the advantage that the stands can be more cheaply made, leveled in less than half the time (because double), and will stay level better; and if a board rots it can be replaced separately without renewing the whole stand. As a matter of magnanimity on my part, however, I'll let you continue to use yours.

Marengo, Ill.

C. C. MILLER.

JAPANESE BUCKWHEAT.

Bees have wintered well in this section. There will be a good deal of Japanese buckwheat raised here this year, as the test last season was so favorable. I think its introduction worth an immense sum of money to the country, if it does as well in the future as it promises so far. I raised 21 bushels from the peck I got of you last year, on poor ground, and one of my neighbors raised 31 bushels from the same amount bought of you.

VOLNEY WHITE.

Findley's Lake, N. Y., April 29, 1889.

HOW BEES GATHER POLLEN.

Under the head of "Pollen," in your A B C book, you say the bee "sweeps his tongue among the grains of pollen." I have peeped around them, and spied about them and under them till my neck was tired, but I have never seen him "sweep his tongue" yet. Last spring I mixed meal and flour, and put it into a shallow box, as a substitute for pollen. One day in passing by I observed a bee in the bottom of the box, digging away with his fore legs among the meal that had gathered in the top. Holding my breath that I might peep closer, I discovered that, with his front legs, he flirled the fine meal or flour among those bristles, hairs, or feathers, on his chest. When he has sufficient, he rises on the wing and then "sweeps his tongue among the grains of pollen," places it on his hind legs, and is ready to get another batch. When gathering from flowers he does the same way. The bumble-bee gathers the same way, except that he sings while flirting the pollen among his feathers.

Smithville, Mo., April 18, 1889.

J. M. AKER.

I confess, my friend, that I never could get a bee to work slowly enough so that I could be satisfied just exactly as to how he did it. Where they work on meal, however, I am quite certain that the tongue furnishes diluted honey, or something equivalent, to enable the bee to pack meal like dough, and thus form pollen masses. Its tongue is certainly a very important tool; but I am not even now satisfied what office it performs.

HIVES WITH MOVABLE COMBS OR NOT.

Friend Root:—In commenting on Question 117 you say, "A few have been bold enough to say there is no particular need that we should have frames at all—just have a shallow brood-chamber, and let the

combs be built in solid." Now, that is just the hive I am using, not from choice, but from necessity. There are some difficulties which, if I can not overcome, will compel me to buy a saw and make frame hives.

How can I prevent swarming, especially after-swarms? I wish friend Hetherington would give us a few dots on that line. How about finding out the condition of the hive as to stores, brood, queen-cells, etc.? It seems that they are much more liable to leave the hive after they are hived than if they had a frame of brood or even frames with starters. I think it would be a good idea to make the inside of the chaff hive of the thick paper used sometimes for ceiling houses, but without the varnish which is put on it. That would give porosity, ventilation, lightness, and warmth.

Cuthbert, Ga., Apr. 6, 1889.

L. A. DUGGAN.

Friend D., you can not very well prevent swarming absolutely, even with movable-comb hives; but if your boxes are shallow enough you can, by holding them up to the light, see the queen-cells, and cut them out with a long slim-bladed knife from either one side or the other. You can also, in the same way, judge of the stores. If they need feeding, instead of giving them an extra comb give them an extra section of combs. You might, with some trouble, give them unsealed brood, to keep them from absconding. Very likely, thick paper or straw-board would answer nicely for the inside of chaff hives.

THAT ORANGE-BLOSSOM HONEY.

Your kind notice of our orange-blossom honey is very greatly appreciated. We have sold about 20 gallons of it, and have left about that amount on hand. We receive for it here, in five-gallon cans, 10 cents per lb. We got about 40 gallons, same as sample, and have taken since (on Saturday, April 20) 15 gallons, a shade darker, mostly from a laurel bush. The next extracting will be from that also; then palmetto and basswood come together so close I fear we shall be unable to separate them as distinctly as I should desire. I will send you a sample whenever I get any that will be worthy of it.

Altونا, Fla., Apr. 22, 1889. JOHN CRAYCRAFT.

BEE-STINGS A CURE FOR RHEUMATISM.

Last summer I began bee-keeping, and up till then I had been troubled with rheumatic pains; but during the time I was stung by bees I never felt any pain from rheumatism. The poison from the stings seemed to cure the complaint. Do you think there is any thing in it?

F. BROWN.

Uttoxeter, England, Mar. 20, 1889.

It has been pretty well demonstrated that rheumatic pains do give way, at least to some extent, when the sufferer is stung frequently by the bees. It just now occurs to me, however, that taking a good sweat every day in the open air, out in the sunshine, might of itself have a beneficial effect on the rheumatism. We have plenty of instances where people have been greatly improved in health by taking up bee-keeping or gardening, or any other like outdoor pursuit; but I do not now remember that we have had positive proof that the patient would have been relieved by sitting in his room and having the bees brought to him so as to give him a sting, say half a

dozen times a day. Perhaps it would be well to commence with one sting a day, and then give him more as he could bear it. I should be very glad indeed to know that the latter plan has succeeded, but I am quite anxious that sunshine and outdoor exercise have their full due. When the days are so warm that I get real sweaty out in the fields, my aches and pains and nervousness almost invariably give way more or less, so I believe in living outdoors a good deal.

YELLOW JESSAMINE: A CASE OF HONEY-POISONING, AGAIN.

Inclosed you will find a clipping from our county paper, that may be of some interest to you. I am not acquainted with any of the parties, but I have no doubt of the correctness of the statement. Whether the death was caused by the poison of honey may be questioned. J. C. GRAYSON.

Wylce, Ark., April 16, 1889.

A SAD DEATH

Mr. and Mrs. Birchfield, with their 5 or 6 children, had a bee-tree cutting near here last Saturday evening. They all ate of the honey except one child, and were all soon attacked with blind dizziness, and went to the house. Maud, their little 12-year-old daughter, was taken very ill, and died in a few minutes. The rest of the family soon recovered and are now safe. Jessamine poison is supposed to be the cause. The bereaved family have the heartfelt sympathies of the Locust Bayou vicinity. J. W. HOLLIS.

Locust Bayou, Ark., April 2, 1889.

Friend G., I wish you would give us the full facts in this matter. If you will go and visit the family, and find out all you can about it, I will pay you for your time and expense.

CAN A QUEEN HATCH IN 11 DAYS FROM THE EGG?

I inclose a circular from Mr. Wallace, of Clayton, Ill., containing a statement that queens may hatch in 11 days from the egg. The statement I call in question, reads as follows:

One very curious freak in nature is, that the egg laid to hatch a worker bee can be changed to a queen, and be made to hatch in *eleven days*; but if to hatch a worker it would take twenty-two days.

In fact, at the convention at Clayton last October he claimed to usually get queens in 11 days, but he failed to convince either my friend Spencer or myself that the bees started his cells from eggs. All the books I have examined on queen-raising state the time as 16 days. Are there any exceptions exceeding, say, two days either more or less than the 16 days given as the usual time? Mr. Wallace certainly has some very nice-colored bees, and very gentle ones; but we could not tell any thing about their working qualities, for in his region there was no crop of honey last season, nor for one or two previous ones. DANIEL E. ROBBINS.

Payson, Ill., April 5, 1889.

I think you are correct; in fact, any text-book on bee culture should settle this matter. The queen may possibly hatch 15 days from the egg; but as a rule it is fully 16. Your friend, without doubt, gave the bees both eggs and larvæ, and the queens were hatched from larvæ which was five or six days old.

WHAT MAKES BEES DWINDLE?

About a week ago a cold northeast wind brought a couple of chilly days. On the coldest of these days we were away from home. Throughout the

day the sun either shone hazily or was thinly clouded. When we got home we found bees in the water-tubs, bees in the chicken-troughs, bees in the buttermilk, bees in the grass, bees on the walks, bees on the pump, bees everywhere, benumbed, and unable to get home. That is what I find always dwindle bees—chilly, cloudy, damp weather. Of course, bees that are least healthy and rugged are least able to stand such weather, and, of course, the colony that is situated and packed so as to be driest and warmest will be the healthiest. High-pressure methods of stimulation, very early in the spring, also drive bees out to perish, often tearing down faster than building up. GEO. F. ROBBINS.

Mechanicsburg, Ill., April 19, 1889.

I think, friend R., that you are exactly right in the matter; and we should endeavor to have the bees stay in their hives during such weather, if there is any way to manage it.

HART'S HIVE-CART.

In moving hives, both single and double, I have often wished for some means of moving other than by hand. It has occurred to me several times that a two-wheeled skeleton barrow would fill the bill, the axle being cranked as shown in the accompanying drawing. From the cross-bar, two pieces of stiff wire or light iron rods could be hung, as shown on each side. To pick up a hive it would be necessary only to run the machine up to the back or front of the hive, and tilt the handles up until the hooks are on a level with the ground. Now slip the hooked wires under the floor-board of the hive. When

the machine is brought level, the hive will be lifted from the ground and will swing level into place, and could be easily moved anywhere, with this advantage—that one person could easily move either a two or three story hive, and it could also be easily adapted to weigh the hives, and also for an ordinary wheelbarrow by laying boards across.

There, friends, you who have to move your hives in and out of winter quarters, I think you will be glad if you could develop the idea into shape.

Avery, Iberia Par., La.

H. F. HART.

I judge from your description, friend H., that you have not yet made such a cart, and I think the principal trouble would be that a hive would swing on the bearings above, like a pendulum. It is true, this could be stopped by fastening two of the arms to the adjoining shafts; but then they would not have the feature to take up and let down the hive. If some device could be fixed, either to let them swing or fasten them rigidly, quickly and simply, it might answer a very good purpose.

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 124.—*Upon what do you have a swarm—foundation, empty frames, or what?*

Foundation or combs. GEO. GRIMM.

Usually on foundation. O. O. POPPLETON.

Empty frames, and contract. A. J. COOK.

Combs, if I have them; if not, foundation.

C. C. MILLER.

Upon full sheets of foundation in wired frames.

JAMES A. GREEN.

If you make a swarm without brood, foundation is better than empty frames. P. H. ELWOOD.

I use frames filled with foundation or empty comb, but never empty frames. L. C. ROOT.

On frames with wired foundation, always putting one frame of brood and one of honey.

P. L. VIALLO.

Sometimes upon foundation, sometimes upon comb, sometimes upon empty frames.

MRS. L. HARRISON.

Principally on foundation, except when I am overstocked with brood-combs that need protection; then I use combs. R. WILKIN.

Upon empty combs, if I have them; and if not, upon foundation; and if I should have none of the latter, then upon empty frames. C. F. MUTH.

Full frames of foundation, to avoid the building of drone comb, or full frames of worker comb (in preference) when we have them. DADANT & SON.

Empty combs, if I have a supply; or if not enough, use some foundation; and if no combs, use full sheets of wired foundation, made by myself on a Given press. A. B. MASON.

Empty frames, with 2 inches of foundation in each frame; give them one or two frames filled with brood in all stages of development. We hive but very few natural swarms. We make nearly all our increase by divisions. E. FRANCE.

Six Gallup frames filled with comb, as a rule, with sections from the parent colony placed over them. Otherwise I use five frames having foundation starters in them, the sections placed over the swarm as before. G. M. DOOLITTLE.

Upon empty combs, if I have them; if not, upon full sheets of foundation, every time. It has been many years since I have hived a colony in empty frames or frames with guides, except some for experiment. JAMES HEDDON.

Upon good combs, if I have them, if early in the season, and honey is coming in too slowly to secure any surplus; upon empty frames after the bees have commenced storing surplus and building new comb; not any more upon full sheets of foundation at any time. H. R. BOARDMAN.

I prefer five frames of comb and two empty frames—putting the latter near the center, but not both together. As second choice, I use one frame of comb in the center and six frames with starters of foundation in them. If my bees would make

foundation as readily as they make comb I would have them make it for sale, instead of buying it for them. For cool weather and a small swarm, I use, of course, a less number of frames than seven.

E. E. HASTY.

I rather expected some of the brethren to recommend hiving bees on empty frames, according to the plan recommended by Hutchinson, in his book on comb honey; but not even Heddon makes a suggestion in that direction. Neither does Doolittle; but friend Boardman rather hints that way, and Prof. Cook may have it in mind, but his answer is too brief for us to be very sure.

QUESTION 125.—*Does the swarming impulse come from the queen or workers?*

I guess so.

A. B. MASON.

I don't know.

O. O. POPPLETON.

From the workers.

MRS. L. HARRISON.

From both, I think.

P. H. ELWOOD.

It comes from the workers, in my judgment.

JAMES HEDDON.

Probably from the dissatisfaction experienced by both.

DADANT & SON.

I do not know. Who does? I think, from the workers.

JAMES A. GREEN.

From the workers, but is instigated by the queen or queens.

H. R. BOARDMAN.

I do not know, but I guess, as in all well-regulated families, there is an agreement.

A. J. COOK.

I think from the workers; and possibly from the fact that there is no one watching them.

GEO. GRIMM.

First natural swarm, from the workers; second, or after-swarm, with virgin queen, from the queen.

P. L. VIALLO.

I guess both, and perhaps the drones too. I never knew any of them to be "backward in coming forward."

L. C. ROOT.

I think the impulse is simultaneous; just as the bees keep cells prepared for eggs as fast as the queen needs them, each inspires the other.

R. WILKIN.

It is hard to tell; but I never knew a swarm to come off unless there was a queen in the hive. But I have known them to swarm when the queen was caged in the hive. The bees returned to the hive.

E. FRANCE.

If blossoms yield, and bees are short of room to store honey, then the queen generally becomes also cramped for the want of cells to deposit her eggs. In such case (and they are in the majority) the workers start the swarming impulse, and the queen is among the last to leave the hive.

C. F. MUTH.

From the whole colony, in obedience to the command of the Creator, who said, "Go forth, multiply, and replenish the earth." All hands are interested in this matter when the time of swarming arrives, and work in harmony with nature's laws to accomplish the object whereunto they were sent.

G. M. DOOLITTLE.

I don't know. Workers without a queen will never start the swarming fever, but that does not prove that the queen does. I once had a swarm issue whose queen I had taken an hour or more before, so that the presence of a queen is not neces-

sary at the immediate time of swarming; and whatever originates the swarming fever, I feel pretty sure the workers can have it. C. C. MILLER.

The swarming impulse is the general restlessness of prosperity and enterprise, and the consciousness of powers within which are not being fully occupied. It affects both queen and workers—sometimes the queen the most, sometimes the workers the most. In proof of this we have the following facts: In a weak nucleus, during hot weather the queen often swarms out when no bees will follow her. She flies around for awhile, and then goes back—or very often intentionally enters some other hive. On the other hand, a prime swarm, when it first comes out, often goes back without clustering, but comes out and clusters all right next day. There is probably more than one cause for this; but I think it sometimes is because the queen, in the first instance, would not come out. That is to say, she had plenty of room to lay, and had no gravel in her shoe at all, and saw no reason for swarming. After-swarming is evidently caused mainly by the endless row the young queen kicks up because she is not allowed to destroy her rivals.

E. E. HASTY.

I presume that many of the friends will remember that I have, in the A B C book, mentioned an instance where a queen deserted an artificial colony and went to her old home, taking all the bees with her. In that case the queen certainly started the work, and took the bees along with her. Other facts, however, seem to indicate just as strongly that the matter was all in the hands of the worker-bees; so I am inclined to think that it is sometimes by mutual agreement; at other times, by the queen alone, and still other times by the bees alone.

QUESTION 126.—*What are the necessary conditions to induce swarming?*

Warm weather, and honey, or honey prospects.

MRS. L. HARRISON.

Abundance of bees, scarcity of room, a generous flow of honey, and fair weather.

R. WILKIN.

A slight flow of honey, if the colony is strong, has some drones and plenty of brood.

PAUL L. VIALLO.

Discontent, extreme discontent. There, I believe that covers the ground, if I understand the question.

H. R. BOARDMAN.

With a well-filled brood-nest at the swarming season, a prime swarm usually issues the first pleasant day after a queen-cell is sealed over.

P. H. ELWOOD.

A colony of sufficient strength, and an assurance that the flowers will give the swarm something to subsist on till combs can be built, and stored with honey.

G. M. DOOLITTLE.

Usually a strong colony of bees, combs filled with brood, no room for the queen to lay. So far as my experience goes, bees seldom swarm unless there is a good flow of honey.

E. FRANCE.

A prolific queen in a hive too small to allow her to use her whole laying capacity, and a crop of honey which crowds her even more. The smaller the hive the more numerous the swarms.

DADANT & SON.

I don't know. A full strong colony and a honey-harvest certainly tend to do it. There may be other causes.

A. J. COOK.

A populous colony, scanty ventilation, and lack of room for the bees to store honey, and for the queen to deposit eggs.

L. C. ROOT.

Ordinarily strength of colony and a moderate flow of honey. But sometimes no conditions are necessary—they'll swarm any way.

GEO. GRIMM.

A hive full of bees, warm weather, a good honey-flow, and lack of room to store honey or raise brood, are conditions which induce swarming; but bees will sometimes swarm in the absence of any one or two of these, and perhaps lacking them all.

JAMES A. GREEN.

The necessary conditions are different with different colonies. Sometimes swarming occurs when there is plenty of room for the bees, brood, and honey. Sometimes it will not occur, even when the hive is crowded with bees, brood, and honey. Usually a crowded condition of the colony, fair weather, and a flow of honey, will induce swarming.

A. B. MASON.

I'd give a good deal to know. I think some of the necessary conditions are, abundance of bees—at least for a prime swarm. When I commenced I supposed I could reel off several, but I confess I'm not sure of another one, and I feel just a little shaky about that one. Heat, lack of room, etc., may induce swarming; but they are not necessary. I know even less about it than I supposed I did.

C. C. MILLER.

The flowers yielding nectar, and a crowded condition in the hive; crowded for the want of room to store or to breed, or both; the instinct of propagation. The above are the ordinary inducements to swarming. But there are extraordinary inducements, such as the hatching of several young queens when the old one is superseded. In such case a swarm may issue at any time.

CHAS. F. MUTH.

The conditions which induce swarming may be divided into two classes, which may, though perhaps incorrectly, be dubbed as natural and artificial. The natural causes of swarming are, season, suitable temperature, proper honey-flow, strength of the bees, and the general animal impulse to multiply the species. The artificial causes, if we may call them so, are lack of room, excessive heat, and a quarrel among a new batch of queens.

JAMES HEDDON.

The absolutely necessary conditions are few—probably only one—a turgid condition of the vessels in the bee anatomy in which are stored the supplies for future brood-rearing. Abundance of food is usually a condition; but sometimes bees will certainly swarm when, as Mrs. Chaddock expresses it, they have scarcely three days' rations ahead. Crowding is usually a condition; but my colony that inhabited a hole in the ground, twice as big as they could occupy, swarmed like other bees, to my great disgust. If what is wanted is practical directions for making a reluctant colony swarm, I should say, crowd them, boom them by giving them sealed brood from other colonies, stir them up by looking them over every day or two, annoy them by destroying their drone brood. A proper combination of these stimulants will make almost any colony swarm, I think. It is worth remembering, that

the non-swarming bees that we occasionally hear of are mostly bees that have been totally let alone for years.

R. E. HASTY.

I expected friend Hasty to say that they swarmed because they got the swarming mania, even when buried in the ground. I do not believe that I exactly agree with friend Boardman when he says extreme discontent. If ever a bee is happy it is when there is a great abundance of honey and pollen coming in; and I think they are happy when they get the swarming mania. They seem to behave a good deal as the younger ones do during a Fourth-of-July parade. They are full of enthusiasm and patriotism, even if they are not big enough to know what it all means. If friend Boardman means that they are getting too happy and too important to remain longer in cramped-up quarters, then I think I agree with him.

REPORTS ENCOURAGING.

FROM 37 TO 60, AND 1600 LBS. OF HONEY.

JUNE 1, 1888, I had 37 stands in Simplicity hives, all in very good condition. I secured 1600 lbs. of honey in 1-lb. sections; average, 43 lbs. to the colony. The season was a poor one. I increased to 60 stands; these I put in the cellar about the middle of November. I took them out April 9th to 11th. All are in splendid condition, except one that had no bees in it. I think they had lost their queen and went into the hive by the side of it. My last year's crop of honey has all been disposed of except about 200 pounds. I got 15 to 20 cents per pound.

C. ABRAHAM.

Fayette, Wis., April 27, 1889.

HONEY COMING IN FAST.

Bees are doing fine. Pollen has been coming in steadily since March 15 (except on rainy days), and the honey is coming in so fast to-day that it can be plainly smelled at the entrance. Box-elder and willow are in bloom now. We use chaff hives. We will not remove the chaff from above the bees till fruit-bloom, which is in about a week. Do you think 100 drones are sufficient for queen-rearing? We have about that many pure ones, and there are no blacks out yet.

S. F. TREGO.

Swedona, Ill., April 22, 1889.

It depends altogether on how many hives of bees you have. If there are no other drones in an apiary of, say, 100 colonies, I should think that 100 drones might answer.

NO LOSS.

Our bees wintered well, no loss. Through the favor of a kind Providence we have never lost a colony yet. I have been an A B C scholar for about three years; commenced with one old hive. I now have eight in Root's chaff hives. I winter on summer stands.

JOHN LANGLEY.

Widnoon, Pa., April 25, 1889.

I never saw a finer yield or nicer honey than orange honey this season. I have 15 gallons from three hives.

J. W. SHEARER.

Micanopy, Fla., April 18, 1889.

Bees wintered well in cellar, and are now strong and healthy. I lost one out of forty colonies.

Falls City, Neb.

GEO. W. SCHOCK.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: Sheer Off, Silver Keys, The Giant-Killer; or, The Roby Family, Rescued from Egypt, Pigeon's Progress, and Ten Nights in a Bar-Room. We have also Our Homes, Part I., and Our Homes, Part II. Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

THE PECAN-NUT OF TEXAS.

I have not finished up the pecans. The pecan is divided in halves like the hickory-nuts that grow in Ohio. There is a hickory-nut in Southern Texas not like that of Ohio. A pecan-tree raises a different pecan from that of its neighboring tree, either rounder, longer, or larger. A pecan-tree raises the same shape of pecan every year, and the same size.

Belton, Texas.

WM. MORGAN.

PAPA'S HILL DEVICE.

We have 32 colonies. One died, and one is very weak. I will tell you the way papa makes his Hill device.

First he takes the hoops of a sugar or salt barrel, cuts two pieces 15½ inches long, and one 8½ inches long, and nails them on a little block as the drawing shows. I made the picture.

Westphalia, Ind. FREDDIE GRAEPER, age 10.

Very good; but why nail the hoops on the blocks? If they are nailed together in the middle and clinched without the blocks they ought to hold and be a little better besides.

WINTERING IN CHAFF.

I thought I would try to get the picture of your own apiary, and tell you how pa winters his bees. He does it in chaff hives. He packs the bees where they were through the summer. He has 50 colonies, which he winters in chaff hives. I have drawn a picture of one. Pa generally unpacks his bees in the month of May.

I have two colonies of my own; and my little brother, who is four years old, has one which pa gave him. I think the hive that I drew is drawn pretty nicely. The hives that pa has take the L. frame. I am 12 years old, and go to school.

Cambridgeboro, Pa.

ALTON HARMON.

Yes, friend Alton, your drawing was really a better picture than our engravers have reproduced above.

DO BEES EVER LEAVE THEIR STINGS IN EACH OTHER?

I am a little boy 9 years old. Pa keeps bees. He has 15 colonies. He gets his supplies from you. Pa reads GLEANINGS, and likes it very much. I

love to read the children's department. I find by Question 108 that your correspondents, including Prof. Cook, have never seen a worker-bee sting another and leave its sting, in combat. This morning I found one stung to death, and left dead on the alighting-board, with the sting of the other left fast to it. I will send the bee to you in this letter, as an answer to your foot-note to the question.

Enola, Ark., March 3, 1889.

W. O. DALTON.

Yes, the bee has got the sting left fast to him. If you will turn again to pp. 138 and 139 you will see that we say, under certain circumstances bees do sometimes leave their stings in each other.

HOW PAPA WATERS HIS BEES.

I will tell you how my papa waters his bees. First he takes a block, one cubic foot large, and makes little cracks in the middle of it. Then he takes a glass, puts it over the can, then turns the can over so that the water runs in the little cracks, and the bees come and drink. Papa has 32 swarms of bees. One is dead, and one is very weak. Papa had to feed his bees this winter. In winter he feeds them with powdered sugar and honey, mixed. Papa is making an incubator. I thank you very much for the nice writing-paper you sent me the other time. I will try to make a picture of how the block and can look.

EMMA GRAEPER, age 9.

Westphalia, Ind.

Your drawing is a very good one. While it is not quite so finished as the engraving which we have made, it represents the idea just as well. We have given colonies water in this way for a good many years. For the last two or three years we have added a little salt to the water, and find that the bees will take the water much more readily.

A DEVICE TO SEPARATE SIMPLICITY HIVES GUMMED TOGETHER.

On page 90, GLEANINGS for Feb. 1, we noticed Mrs. Chaddock and her husband had trouble in removing the top story from the Simplicity hives. We will try to help them out of it by telling about the machine we use for that purpose. The accompanying drawing represents our idea. The post, B,

which is about 3 in. wide and $\frac{3}{4}$ of an inch thick, extends from the hand-hole below, where a piece of iron, A, is joined on at right angles to the post. This iron fits into the hand-hole of the brood-chamber. The post is joined to the lever, C, by a hinge, about 3 in. from the end. The lever should be 18 or 20 in. long, and flattened off at the top to fit into the hand-hole of the upper story. With this machine, which is not patented, father has no trouble in separating hives, no matter how tight they may be

glued. It should be made of hard wood. A common door-hinge will do to join the post to the lever. Galena, Ill.

HALLETT BROS.

HOW PAPA GETS RID OF THE CODLIN MOTH.

I thought I would tell you how my pa catches codlin moths, and other moths and bugs. When fruit-trees are coming into bloom he gets molasses-barrels just emptied, and puts water in them. Then he takes wire cloth and makes it in the shape of a funnel, with a hole in the little end. Then he drops it, small end first, into the barrel and fastens it to the top of the barrel by bending the edge of the big end of the funnel over the chime of the barrel. In the morning he skims out the moths and uses them for fertilizer for his fruit-trees. He covers it in day time to keep out bees. GEORGE HOBBS, age 12.

Middleport, O., Mar. 9, 1889.

PAPA'S BEST HELPERS.

I herewith inclose you a drawing which I made with one of your polished cedar rubber-tipped pencils. These scenes were enacted last summer in my father's apiary, about the time P. Benson went west. We were talking about what became of him just as I was about to bend the little tree over (as seen in first scene), in order that it might be reached and pulled over so that the swarm of bees that had clustered near the top might be shaken down in front of the hive. As I was creeping out a little further, the tree broke, and down came tree-top, bees, and all, in a bunch together, without a sting. Father remarked, "That is what became of P. Benson."

SWARMING AND HIVING, IN TWO ACTS.

Father says that his best helpers in the bee-yard are the fountain-pump and my little sister Ella, who may be seen in the drawing. The fountain-pump is used to bring down the swarm, and sister Ella brings the bee-veil and brush when needed. Father adds, that every scientist should have these helpers in the bee-yard, and a copy of Pilgrim's Progress in the home. WALTER A. CHAPMAN.

River Falls, Wis.

Your drawings were very good, and we have tried to reproduce them as nearly as we could. It is a little remarkable that you were not stung nor hurt, and we are all very glad of the happy result. An accident from which no great harm results is often the best kind of a warning against the repetition of another, the result of which might be tenfold worse. It is not safe to risk our bodies on limbs of questionable strength, particularly when after a swarm, for angry bees may add to a broken arm hundreds of stings.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

MARKET-GARDENING AT THIS DATE.

THE present year, 1889, just now seems to bid fair to give the working classes every thing in the way of garden and farm produce at lower prices than have been seen before for a long time.

We have had an abundance of almost every thing all winter. Apples sold until the first of May for from 25 to 40 cents a bushel. Excellent dry beans sold lower than for many years, and we have had beautiful eclipse beets on our wagon all winter at only 15 cents a peck; and this 7th of May I should be very glad indeed to sell 100 bushels at 15 cents a bushel. We have had nice cabbage all winter long for about a cent a pound. Toward the first of May good solid heads ran up to 5 cents a pound. We have beautiful solid heads of red cabbage, even now; and I wonder if anybody else has noticed that red cabbage keeps perfectly sound better than any of the white kinds. I should consider it an acquisition if I could have a white cabbage as hard and solid as the red, and that would keep so until the following May. We also have carrots on our wagon that were raised last year. Celery has been sold at 10 cents a pound all winter, and we have some now growing in the greenhouse. We have sold lettuce every day in the year. There is a very fair demand for it now at 15 cents a pound. Onions have been a drug, and there are said to be 1000 bushels in our vicinity now, without a purchaser. We have sold parsnips every day all winter until up to the first of May, and now we are lugging them out of the cellar and feeding them to the Jersey cow. Potatoes, I am told, are *given away* in our vicinity. We now get 30 cents a bushel for Snowflakes, with the sprouts broken off. Salsify has been about like parsnips, only we get 5 cents a pound for it where we got only one for parsnips. Spinach still brings 10 cents a pound, and we have for the first time succeeded in wintering it over nicely. It was sown so early last fall that it was fit to use before winter set in. We have sold it all winter; and although it had no mulching at all, the injury done by frost was very little. Just now the wintered-over plants have made a large fleshy stalk just above the root. In gathering it we cut it just below the ground, then wash it and place it in the basket with the root part uppermost; and the reddish pink of the root and stalk makes it very attractive. This fleshy part is also very rich and delicious. Spinach has found a permanent place in our Medina markets. We succeeded in having good wintersquashes until some time in February. Tomatoes of our own canning sell very well the year round. We save our tomato seed from the tomatoes that are canned; that is, we pick the choicest specimens of fruit, prepare them just as we do for canning, then scrape out all the seeds, saving them, and canning the other part. By this means we kill two birds with one stone. The seeds give us a profit, and the tomato sells for

enough to pay the expense of canning and gathering the fruit. The great canning factories, however, have reduced the cost of canning to so low a figure, that, were it not for the seeds we save, I am not sure that we could compete with them. Turnips are also on our wagon, but they sell pretty slowly.

Now during this season of great plenty there are three things of which we have not had enough, and that have brought and still bring excellent prices. These three things are asparagus, radishes, and lettuce. Last spring, for the first time we sowed some seeds of the Palmetto asparagus with a view of selling plants. We have had a good trade in the plants, and I am greatly surprised to find them sending up remarkably strong shoots even before our oldest asparagus. In fact, I had decided that, if one did not care any thing about the vigor of the plants, he might have asparagus for the table from the seed sown the season before. Well, in the *Orchard and Garden* for May I find the following:

"I have sold good average asparagus, one year from the sowing of the seed."

Of course, the ground must be up to the highest state of fertility. Our seed was sown on a strip of ground that I had manured up specially for strawberries. It was a sandy loam on the creek bottom. What made me think it would raise good asparagus was that some remarkably fine shoots came up along the creek before the ground was cleared up at all. I do not know that I ever saw or heard of asparagus being a drug in any market. Very likely it will be, however, very soon, especially after what I have said here about it.

The finest radishes we ever raised were from seed purchased of Stokes & Johnson, of Philadelphia. It was Wood's Early Frame. Every seed produced a nice-shaped radish. The seed was planted in the open air, in a spot protected by our buildings. I think it was sown about the middle of March. All insects were kept from troubling by the use of lime and guano, as mentioned last month.

To supply the demand for lettuce, we are obliged to gather our Boston Market a little before it makes any nice head.

We find the following in the *Orchard and Garden*, in regard to Henderson's dwarf lima bean:

We have already spoken highly of the new dwarf lima bean. We did not speak by the catalogue, but by practical experience, for it was grown here last year. Its chief merit, aside from its bush habit, is its earliness, and almost its only drawback the small size of the beans themselves. In quality they are not a whit behind the old sort, but are in fact rather better. Having secured the habit in the earliness, two important points for Northern culture, our cultivators will not be long in gaining size for it.

It seems we are going to have at least a few of Kumerle's dwarf lima beans, as the following note from our jovial friend Livingston (the man who has given us so many nice new tomatoes) indicates:

Mr. Root:—Have you found any one to reduce your surplus of gold by sending you that ounce of Kumerle's dwarf lima beans? If not, we may accommodate you if our grower has not already sprouted the beans. We were fortunate enough to

secure early a very few packets. We prize them, but *might* divide "for gold."

A. W. LIVINGSTON'S SONS.

Columbus, Ohio, May 3, 1889.

Some years ago I purchased half a peck of what is called Dreer's Improved lima bean. The beans were excellent, and they were packed so close in the pods that they squeezed the ends of many of the beans so as to be square, unlike an ordinary lima bean. In flavor they equaled if not excelled, any thing in the way of lima beans we have had on our table. I dropped them because I thought they did not yield as many bushels per acre as the common limas. Well, when I first saw Kumerle's lima bean they struck me at once as being remarkably like Dreer's Improved lima; and now it transpires that they are a sport from the latter. Those who have seen them growing say they grow about two feet high. I should think they would be liable to be blown over during fierce storms of wind and rain. We will give you a photograph of the plant in a few months, nothing preventing. Those who have not a paper of Henderson's Improved lima bean will have to send in their orders now very soon, for we shall have them all in the ground that are not sold, certainly as soon as June first.

Just one thing more in regard to Kumerle's lima bean: If the seed is now worth *its weight in gold*, we can not well afford to wait till 1890 to get a new crop. As GLEANINGS makes its way to localities where the sun shines at midnight, possibly it reaches some one who could take the beans as soon as they ripen here, plant them, and get a new crop ready to plant by the first of next June. Perhaps friend Poppleton, away down in Cuba, could manage it. If any one else whose eyes rest on these pages lives where lima beans may be raised in the winter time, will he please communicate with us?

Later.—Well, we have got them at last. Six packets of the Kumerle lima beans—each packet containing 25 beans. But to get them we were obliged to balance them with gold coin, and the 150 beans cost us just \$78.00, or a little over 50 cts. a bean. Never mind. If it is not wrong to "count chickens before they are hatched," we might speculate that each bean should raise us 50 more beans.* Then in the fall I should have, from my 150, 7500, which will probably give one bean to each subscriber, who cares about bush lima beans, for the year 1890. Now, some of you may think that this is awful, to pay \$78.00 for a handful of beans; but there is something I rather like about it. Along in my talks about what to do, I told you a gardener or fruit-raiser had a perfect right to get all he could for his product. If he can produce strawberries under glass so as to have them when nobody else has any, he has a right to have a dollar a quart if he can get it. And in the same way, if you can produce a crop of any thing when everybody else fails, it is perfectly right that you should have just as much as anybody will pay you for it; and if you have

sole control of some new and valuable variety of vegetable, for which there is universal want and demand, I am glad to see 50 cents—yes, or even a dollar—offered for a single seed. There are doubtless more of these Kumerle beans in the hands of seedsmen; but very likely they are not to be bought—no, not even for their weight in gold.

Later.—Here comes a bush lima bean from Nebraska:

Friend Root:—I see you are very much interested in bush lima beans, so I will send you a sample of some from Nebraska. How do they compare with Henderson's, Landreth's, and other bush limas? Please let me know what you think of these Nebraska limas. If you desire, I will tell you all I know about them. S. H. BEAVER.

Tamora, Neb., May 6, 1889.

Why, friend B., your sample of beans looks exactly like Henderson's, only they are considerably larger. If some one had picked the very largest beans they could find, out of a good lot, they would be exactly like those sent, as near as I can tell. By all means tell us all you know about them, and tell us how many beans you can get hold of.

May 9.—We have been having the most beautiful May weather for four or five days. The sun rises away up in the north, and pours its genial rays from half-past five in the morning until seven at night. I do not know that I ever enjoyed any thing in the line of God's gifts more than I have the sunshine and the open air this morning. The apple-trees are in their bloom, and the bees were tumbling before their hives with great loads of apple honey, before the sun was up. I do not know that I ever noticed this before. It is, perhaps, owing to the fact that we have had no dew for four or five nights now in succession; but as the ground was soaking wet before this warm spell came on, nothing seems to mind the scorching rays, even at noonday, unless it is our newly transplanted cabbage and celery plants from the seed-bed to the plant-garden. We have to water them and shade them, or else they would soon "go dead." Well, I have been down in the creek bottom, planting our novelties. You see, we sent for almost all of the novelties advertised in the catalogues. Then it is a nice little task, I tell you, to plant them carefully, and label them. We think it is almost as important to tell whom the seed came from as to tell what it is; and we also want the stake at the head of each row to tell what the seedsman claimed for it. For instance, Burpee has a new black wax bean. The seeds were twice as large as our old black wax. He claims that they are a great deal earlier, have larger pods, and are more productive. Now, when the beans begin to get ready to gather, I do not want to be obliged to lug a great lot of catalogues down into the field to see what the introducer claimed for them when we made our selection of seeds last winter. Well, Burpee has fixed it all nicely for us. His seeds are put in paper so stout that it is almost like cloth; and all he claims for the contents is plainly printed on this same stout paper;

* If they give 100 or more, I shan't complain.

therefore, all we have to do is, when we are ready to plant, to pour the seeds out of the package into a little shallow tin basin. Then the empty paper is wrapped round a stout stake, and fastened by four tacks. This was my part of the business. The stake was then driven into the ground so far that even a smoothing-harrow would not break it off nor pull it up. Then the basin of seeds was set down against the stake. One of the men then followed and put the seeds in, covering them with nice mellow dirt. Our ground was first prepared by plowing, harrowing, and rolling; then with the seed-drill we sowed phosphate over the whole surface. Lastly it was marked with our disk marker. This puts the whole field in regular order; and all kinds of seeds can be planted rapidly and systematically. The ground was marked over all the same. The melons, squashes, cucumbers, etc., were put in only every other row. Sweet corn, peas, and the regular crop of beans, are sown with the seed-drill, at the same time that we sow the phosphate.

Now, there is one more thing that makes our creek-bottom ground very pleasant. It is that spring that I have told you so much about. During these hot days, pure limpid water is constantly pouring over the sides of the sewer-pipe that is set over the spring. To keep the sun from shining directly on the surface of the water, a tin hood covers the sewer-pipe. This hood is painted, so it does not look unsightly. It also keeps grass, weeds, and dust, from blowing into the spring. The hood opens on the north side. Some steps go down to the spring, and a tin dipper hangs on a little bush right beside it. When one is tired as well as thirsty he can sit down on the lowermost step as he dips the water from the spring, and drink leisurely. How deliciously cool it is! If one's hands and face are sweaty and dusty, there is nothing to hinder dashing the cool water over both. If there is anything in this world that fits the little line,

"A thing of beauty is a joy for ever,"

it is that spring. It is almost in the center of the grounds, so that the workmen have but a little way to travel whenever they need a drink. We do not have any jugs nor tin pails to lug around and get lost. You will remember that we should never have known of this spring at all had we not searched diligently for it; and I think that you too might have a spring of water right out in the lots if you would only hunt it up. "Seek, and ye shall find," the Scripture says.

Yesterday in the afternoon, when the weather was so hot, I raised the lid of the well by the windmill. Sure enough, that faithful and untiring worker had pumped the water out, clear to the bottom, and another beautiful little spring was seen down at the bottom of the well, bubbling and gurgling as it ran out of the rocks and between the bricks, down into that little central basin where the pump was sipping it up as fast as it could run in there; and off in the lot adjoining, the Jersey cow was enjoying herself in sipping the water from her

tub. Then as the tub overflows into the carp-pond, the carp were probably enjoying their share of the water that pours, winter and summer, into that, to make up for evaporation and seeping. Thus you see, if you can not have a spring on the top of the ground, you can have one down at the bottom of the well; and I think you want a windmill to pump the water out so as to keep the stream running, if you want to have it nice. The windmill has been going for almost two years, and I do not remember that it has ever yet disappointed us for one hour. Of course, there have been some days when the mill did not run very much; but there has always been water enough ahead. Only last evening my wife remarked that the windmill was running slowly, when scarcely a breath of air could be perceived. It turned fast enough, however, to keep a slender stream of water running.

HOW WE RAISE POTATOES IN THE AMERICAN BOTTOM.

Lest some of the readers of GLEANINGS are not acquainted with the location, I will say that the "American bottom" is on the east side of the Mississippi, opposite St. Louis, and extends north to Alton and south to Chester, and has a depth, back from the river, of from 5 to 14 miles. The soil chosen for potatoes is usually the dark sandy loam. Very late fall plowing is the rule for at least half of the potato crop. The fall-plowed ground is used for the very early planting. The planting here begins just as soon as the frost is out of the ground (sometimes in February). A word about seed. With very few exceptions the farmers of the bottom never plant potatoes for seed that they have raised. They buy seed from the North, or of farmers on the bluff who raise their potatoes under straw. Our own potatoes do not make as strong a growth as the imported ones. Our standard potato here is the Early Ohio, and next comes the Early Rose and Beauty of Hebron. For late potatoes we have the Mammoth Pearl and the Peerless.

On account of the rapid and continued growth of weeds, the potatoes are always planted in checks and cultivated each way. They are still dropped and covered by hand. As soon as the potatoes are up enough so that the row can be followed they are gone over with the bar-plows, and two light furrows of dirt are thrown on each row. The ridges are then dragged over with a rail, and partially leveled down. This destroys all the weeds, and at the same time seems to benefit the potato. The second and third cultivating is done with the one-horse cultivators; the fourth with the bar-plows; and to lay them by we use a large single shovel and run once between the rows. But before the time of the last plowing the bugs will claim some attention or claim the crop. The only way we have been able to circumvent their ravages is by poisoning them. One teaspoonful of Paris green to two gallons of water, sprinkled over the vines as often as necessary will do the work. It would be quite a large undertaking for a man to hire the bugs picked off from a fifty-acre patch. The potatoes are now laid by, and the next process is the digging. We still rely on the hoe, the digger being paid by the barrel, 3 bushels, at from 8½ to 20 cts., according to circumstances. The digging begins about the middle of June, and

continues until late in the fall, digging at whatever season they can do so most profitably.

Venice, Ill.

G. W. T. REYNOLDS.

GOD'S GIFTS.

I agree with what John Craycraft says, Oct. 15, 1888—give us the "garden sass." This makes me think, I can raise seed of certain vegetables here to good advantage without their mixing, if I could sell it after I have raised it. I have been, the past three years, using muck in privy and hen-house, as mentioned in your book, What to Do, and find it the best and cheapest absorbent (except road dust) I ever used. I am using it this winter behind my two cows. A good painful, sprinkled on the plank after cleaning out each day, keeps the stable clean and sweet. I draw it out in August, when the water is low, pile it up, and let it freeze one winter, then dry it, then put in boxes or barrels up off the ground, and under cover. When it is dried and ground fine, like sawdust, it is a great thing to keep out frost. I have about two acres on my ten-acre farm (one of God's gifts), of peat and muck land, all the way from 1½ to 3 feet deep, which is easily drained, is perfectly level except for bogs, and covered with grass.

R. B. KIDDER.

Columbus, Wis.

THE TURNIP THAT STANDS IN THE GROUND ALL WINTER, WITHOUT HARM.

Our readers may remember that Abbott L. Swinson, of Goldsboro, N. C., sent me some of the seeds of this, last fall. The turnip is a cross between our well-known seven-top turnip, which has been raised so largely for bees and greens, and one of our other varieties producing a bulb. Well, I am happy to tell you that this turnip is a success. They stood in the ground all winter, apparently without injury; and now they are furnishing just as many blossoms for the bees as I ever saw in the seven-top turnip. The bees are humming on them now, this 11th day of May. We propose to save the seed from the whole crop.

AN EARLY PUMPKIN FOR PIES.

In response to my inquiry, 13 friends sent me seeds of an early pumpkin. That they were not all the same thing, is pretty evident from the seeds. In fact, the seeds seem to indicate that scarcely two of them were alike. We have planted one hill of each, labeling it with the name of the person sending it, and in due time we propose making our report.

FEEDING IN THE CELLAR.

CARRYING BEES THROUGH SUCCESSFULLY, WITH NO STORES AT ALL TO START WITH.

I HAVE a little report to make, which may be of advantage to others who get caught in a tight place. We have had in this locality two very bad years for honey; 1887 found us in the fall with plenty of bees and nearly empty hives, so far as honey was concerned. I fed up and brought my bees through the winter on a mixture of honey they had in the hives, and syrup. Spring came, and opened out well. Every thing was lovely till the first of June, when the fact dawned on us that there was no white clover in the country, and the alsike had no honey in it. July arrived, and a little basswood came in. None, however, was stored in

the surplus apartment. A few, say 5 or 6 out of 23, swarmed. When the last of September came, the hives were full of old bees, no pollen, and very little honey. I divided it equally among them, after doubling the lighter ones up, till I had only 20 swarms left. I was very busy with my practice and building, which occupied my time, and I saw little of them till a warm day, the 6th of November, when they were having a good fly. I looked them over to see how they stood for provender. To my surprise I found they had already eaten up 75 per cent of what I had allowed them 6 weeks before. I went to work and took all the honey in the apiary, and gave it to six hives and put them up in chaff hives for winter. The rest, fourteen in number, I carried to a north room in the cellar, darkened the windows, and made up my mind, contrary to all rules, to save my swarms. I took off the supers, and cloth off the top of frames, laid one frame flat on the rest, and once a week I opened the doors from the furnace into the rest of the cellar; and when the heat got up to about 65 I went in and fed them, giving each hive less than a teacupful of syrup. The next morning I shut off the heat by shutting the doors, and let them alone a week. Temperature during the week stood at about 56°. This I kept up till April 15th, when I saw pollen coming into the hives outdoors. I brought them from the cellar. I had concluded they were very light in bees. Two of the fourteen were; the rest are good average swarms, covering, when in cluster, from four to seven Heddon improved Langstroth frames. On the whole they are not as well, as strong in bees, nor as far advanced, as those I left out in chaff hives.

Honey is now coming in from the soft maple. One hive I examined this afternoon had several combs, outside of those with eggs, filled with nectar, and the margin of seven frames that had eggs and larvae in the center were completely filled. I would not advise a novice, nor, in fact, any one, to try the experiment. I had every advantage. I could heat their room as I liked, and as often as I liked. Another thing I proved, too, was the fact that light is no detriment. I happened to be going by the door once in day time, and observed that the sodding I had up at the basement windows had settled 2½ or 3 inches, by the frost having gone out, making it as light as day. As the sun was pouring in this opening, to my surprise the bees were as quiet as in the darkness of the night, with no cloth over them, and the thermometer at 46°. I always took a light, a common lamp turned up, and set it down in the middle of the room, and there was seldom a bee that left the hive; never more than two or three during any time I was feeding them.

DR. A. E. HARVEY.

Wyoming, Ont., April 18, 1889.

Friend H., with a furnace in the cellar to dry it off and warm it up, it is not any wonder that you succeeded; and in regard to the matter of light, when bees are in a state of perfect health I do not know why they would be any more likely to fly out at a temperature of 46 in the cellar, than if they were outdoors. Bees in health seldom go out of their hives unless the temperature of the air runs to about 55. If the sun shines, they often go out in sunny nooks; but it is because the sun raises the temperature, and not because the light entices them.

MYSELF AND MY NEIGHBORS.

I know that my Redeemer liveth.—JOB 19:25.

DEAR friends, I have thought best to submit to you to-day a sermon that was preached in our pulpit a few weeks ago. I have decided to do this because the question has come up so often, "How shall I know that I am a Christian?"

CHRISTIAN ASSURANCE; SERMON BY REVEREND NORMAN PLASS.

Examine yourselves whether ye be in the faith; prove your own selves.—II. COR. 13:5.

A question that is often asked is this: "*Can I know whether I am a Christian or not?*" It is variously answered. One will tell us that he has an abiding and blessed assurance that he is a child of God; another will say that he is confident of it at times, while again the light of his hope grows dim and he is left in doubt. Still another will say that he has never experienced an assurance that his name is written in the Lamb's book of life. The first confidently exclaims with Paul: "*I know whom I have believed.*" The second, while at times appropriating these words, is at the next moment ready to exclaim with Thomas, "*We know not.*" The third is like the heroine of "*Miss Tooscy's Mission*," who, although a sincere Christian, yet when in time of revival the presiding clergyman "invited all those who were conscious of conversion to remain, and the rest to leave, without a moment's hesitation went out, and found her way home, sobbing and broken-hearted."

Were the question, "*Do I know whether I am a Christian?*" it would be thus variously answered. But it is a question of *possibility* and *privilege*—"Can I know?" As thus asked, we can best answer it by considering some of the *conditions* we have to fulfill in order that we may be Christians, and by deciding whether or not we can know that those conditions are fulfilled. I hold that it is the privilege of every believer to know whether or not he is saved—and not only the privilege, but the *duty*, for the words of our text come to us in the form of a *command*: "Examine yourselves, whether ye be in the faith; prove your own selves."

The basis of the Christian life is a *belief*—not a mere *intellectual* belief, implying simply assent to a proposition or truth, but a belief that *implies a surrender of the life*. It is such a belief as the wife has in her husband—a belief not merely in his integrity and sincerity, but a belief that leads her to *surrender herself*, to a large extent, to his *care and direction*. Not only is it the *privilege* of the wife to know whether she thus believes in her husband, it is her *duty* to know before she makes the surrender. In like manner it is our own privilege and our duty to *know* whether we exercise *self-surrendering belief in Christ*. Why can we not know just as well as the wife whether we exercise such a belief or not? This implies a surrender of the *affections*. What would you think of a woman who should say that she didn't know whether she loved her husband or not? It's her *duty* to know, even before she becomes his wife. Should not, then, Christians, who as a body are called "the bride" of Christ, know whether they love Christ or not?

We speak of "a change of heart," or "the new

birth." What is the change of heart? Simply a *change of affections*. A person says: "I don't realize that I have had a change of heart, so I don't believe I could have had, for I should know it if I had, wouldn't I?" That depends entirely upon what you make the *standard of your judgment*. If you have expected to feel your *fleshy heart* gradually passing away and another heart taking its place, you no doubt have failed to witness the change. If you expect a great upheaval of your emotional nature, followed by a great influx of feeling and untold joy, you will no doubt be disappointed, and conclude that the change has not come. Such an overflow of feeling results only upon a great change in *belief and life*; and with most of us, when we become Christians, there is a change neither in belief nor in life, but only in the point of *surrender*. A young man who was troubled at this point came to his pastor. After a few words the pastor asked, "What do you understand the heart to be?"

"The affections," replied the youth.

"That is correct. Now, are you sure that your affections have not changed? Did you love to pray a month ago?"

"No! I was accustomed to pray, but it was a mere formal duty."

"Is prayer a pleasure to you now?"

"It is, decidedly."

"Did you enjoy association with Christians then?"

"No! not at all. I shunned them."

"Do you shun them now?"

"No! I like to be with them."

"Do you love to read the Bible?"

"Very much."

"Did you a month ago?"

"I can't say that I did."

"And can't you think of several things that you used to find pleasure in that you don't care for now?"

"Oh, yes! very many."

"Can't you see, then, that you have met with a change of heart? If by the heart is meant the affections, and your affections are changed from what you once loved to what you once hated, so that now you care not for the former and hate the latter, you have certainly experienced a great change of heart."

Here was a clear case. All that young man needed was to understand himself. Whoever can answer those questions as he did, has, certainly been born again. With some of you, there may be but a single indication of the change that you can now discern. You may enjoy the prayer-meeting now, whereas you didn't before. A young man who is seeking Christ, but who doesn't think he has found him yet, said to me a few evenings ago, after the prayer-meeting, "I never enjoyed a meeting like that before." Is not that an indication that he has found Christ? You may like to be with Christians now, whereas you shunned them before. Take these new affections as indications that you have been born again.

But a person says to me: "I have *always* had these feelings. I never thought that I hated God. I always liked to read the Bible. I always loved to associate with Christians. Yet I never felt that I was a Christian." But if your affections are upon these things, you are a Christian.

"What!" you exclaim, "could I be a Christian and not know it?"

Yes, I think you could. You can't be a *full-grown*

man without knowing it, nor can you be a fully developed Christian without a knowledge of the fact. But you can be a child in Christ, and know nothing of it. You spent many months of your life before you realized your existence in this world, and came to the consciousness that you were a child. So it is possible for a person to have been born again a long time before he has awakened to a consciousness of the fact. Do not call in question the possibility of your being a Christian because you can not trace the beginning of the Christian life, any more than you would question your physical existence because you can not trace the early months of your life, or can not remember when you were born. There are a great many people, recognized as earnest and sincere Christians, and themselves conscious of a change of heart, who are compelled to confess that they can not mention a time when they gave their hearts to Christ. What a great many need is to realize that they are already Christians, because they love God and the things of God; and all that they need further is to come out and confess Christ before the world. A gentleman of my acquaintance was very ill, and not expected to live. For two weeks he seemed at the point of death. He had been a godless man, and during that time I spoke frequently with him regarding Christ. He seemed to make a complete surrender, and told his friends that he had found Christ. At length he grew better, and then we discovered that he could not remember a single event of those two weeks—not a single call, not a circumstance, not a word spoken, could he recall. Yet, when he came to himself, it was with the joyous consciousness that he had found Christ. The weeks themselves were blanks, yet in those weeks he had been born again, and afterward the consciousness of that fact was his. Is it not true of us, that in one event of life or another, we sometimes unconsciously yield up the point that separates between us and God, so that we become truly his, and all that we need is to come to ourselves and realize it?

We spend too much time in examining our own hearts. We might conceive of a crazy man cutting out a friend's heart and dissecting it to discover whether or not the friend loved him. Would he ever find out in that way? Yet in much the same way do we often go about examining our own hearts to discover whether or not we love God. While the seat of the affections is in the heart, we might spend a lifetime in examining it, and yet never find the affections. Don't let us stop and look at our hearts to see whether they are old or new, but let us look out toward God and ask whether we want to please him by doing his will; and if we do, then are we friends of God; and if friends of God, then surely we have been born again. We know whether we believe in Christ with the belief of self-surrender, and if we do, that's enough—let us go on and do what he would have us, and leave the matter of a new heart with Him who created and whose it is to re-create. If we have thus done our part, we can have the assurance that God will do his part toward making the heart new. There may be no wonderful transformation, there may be no sudden change, there may be no great revelation of light, but we have simply to decide the point of self-surrender to Christ, leave the rest with God, and go straight ahead.

We sometimes call the Christian life a vocation. Can we not know whether we have entered upon

that vocation or not? That is not a question hard to decide in other vocations—why can we not decide it here? In a little book entitled, "Being a Christian," by Dr. Gladden, I find this illustration: "Ask a man what his business is, and he will answer promptly enough, 'I am a carpenter,' or, 'I am a lawyer,' or, 'I am a druggist,' or, 'I am a machinist,' as the case may be. The carpenter does not say to you, in a sad, uncertain tone of voice, 'I don't know; I have been trying for five, ten, or forty years, to be a carpenter, and I have sometimes hoped that I was one; indeed, there have been seasons when I felt quite sure of it; but I am often in great doubt. He may say, indeed, 'I am not so good a carpenter as I might be; I have seen nicer workmen; but I can do a pretty fair job, and I am not ashamed of my trade. It is one that I freely chose, and that I have done my best to learn; and I shall work at it as long as I live, if I can find employment.' Surely there is nothing presumptuous in saying as much as that. A man who did not have his mind made up about such a matter, and who did not know his own mind, would never accomplish much in this world." Why, then, is it not just as possible and just as essential that a person should know that he has chosen the Christian profession, that he has entered upon the heavenly calling, even though as yet he may be only an apprentice at the trade? If uncertainty seems strange in the one case, why not as unaccountable in the other? If we have chosen the Christian calling, and are working at it every day, trying to improve and perfect ourselves in every way possible, we certainly ought to know the fact. One reason for so much uncertainty, just in the line of this comparison, is because we don't clearly understand what we are about when we set out in the Christian life—we don't comprehend that we are choosing a life calling, and hence should know our choice. Another source of uncertainty, here suggested, is portrayed in the boy's remark, when asked whether his father was a Christian. "Yes," he replied, "he's a Christian, but he a'n't working at it much." We don't work at our trade constantly enough to keep our zeal up. A man who didn't work at the carpenter's trade more than half a day a week might well question sometimes whether he were really a carpenter or not. A carpenter who never did, and never tried to do, a good job, might well be declared by his fellow-men to be no carpenter at all. How, then, about professing Christians who are only half-hearted in their work? Can they be called Christians at all? If not, how about their assurance of the fact? Another source of uncertainty is because, when we fail at some point, we conclude that we were mistaken and are not Christians at all. But when our purposes are good and our endeavors earnest, are not our failures excusable, just as the carpenter is excusable when he does the best he can, although he may not do quite as good a job as another carpenter? We should know that we have chosen the Christian calling; we should steadily persevere in it; and when mistakes occur, rise superior to them and press resolutely on "toward the prize of the high calling of God in Christ Jesus."

Can we not tell whether or not we are spiritually blind—whether we have received spiritual sight? Think you that any blind man whom Christ healed would be uncertain of that healing? Are we told of any who said he didn't know whether he could

see or not? You recall one whom the rulers of the Jews attempted to confuse, telling him that Christ was a sinner and could not be divine, threatening to excommunicate him, accusing him of forsaking Moses, to all of which declarations and accusations he replied: "Whether he be a sinner or no, I know not; *one thing I know*, that, whereas I was blind, *now I see*." Can't we know that much, however many points of theology we may be uncertain of? Possibly we are more like the man whose eyes Christ touched, and then asked if he saw aught. To which he responded: "I see men as trees walking." Then Christ again touched his eyes, and he saw "every man clearly." If we have even a little spiritual sight, can't we know it? If our vision is fully restored, how can we help understanding it?

Have we not ground for believing that we can know whether we are called or not, in the very character of Christ? For illustration, suppose that Dr. Pasteur's theory of inoculation to prevent hydrophobia were found to be an assured success, and that, having never fully declared the secret of the cure, Pasteur should decide to make it known to the world, so that any who had need could at once apply the remedy. But he declares the secret in words so technical, or so indefinite, or so unmeaning, that not one in a thousand can comprehend what he means. A poor fellow has been bitten by a mad dog, and is trembling in fear of approaching death, and knows that here a sure cure is spoken of, but he can't understand just what to do. He does as he *thinks* he is directed, but can't be sure, and waits in dread anticipation to see whether the rabies will seize upon him. Rather than extol Pasteur as a benefactor, would you not rather condemn him because he made known the remedy in such uncertain terms that men can not know whether they have properly applied it or not? What, then, would you think of the "great Physician" if he should set out to declare to the world a remedy for the malady of sin, and should be so indefinite in his declarations that those who feel the dread poison coursing through their veins, and are crying out to be saved, could not understand what the remedy was, and could not know till death began to creep upon them that they had failed to comply with those conditions? The very character of Christ compels us to conclude that we can know whether or not we have fulfilled the conditions of eternal life. We find the directions very explicit—"Whosoever *believeth*—shall not perish, but have everlasting life;" "Verily, verily, I say unto you, he that *heareth* my word, and *believeth* on him that sent me, hath everlasting life, and shall not come into condemnation, but is passed from death unto life"—no future translation—"is passed," *even now* new life is coursing through his veins; "Hath everlasting life," not, "shall have," or, "may have," but "hath"—a present possession, a present reality, and should be a present assurance.

The Bible reveals to us a number of tests, by which we can know whether we are Christ's or not.

I. John 3: 14.—"We know that we have passed from death unto life, because we love the brethren."

Rom. 8: 16.—"The Spirit beareth witness with our spirit, that we are the children of God."

I. John 5: 10-12.—"He that believeth on the Son of God hath the witness in himself—and the witness is this, that God gave unto us eternal life, and this

life is in his Son. He that hath the Son hath life; he that hath not the Son of God hath not life"—so reads the Revised Version. Note, the change in the words underscored—"and this is the record," of the A. V., is changed to "the witness is this," in the R. V. We are not compelled to probe our hearts for the witness. We have the "witness within ourselves," to be sure; but, likewise, "The witness is this, God hath given to us eternal life—He that hath the Son hath life." Have you the Son? That's the question. If you have received the Son, you have life. "These things," adds John (v. 13), "have I written unto you, that ye may know that ye have life." Just take your Bible and read the whole of this *First Epistle of John* if you want to know whether you are Christ's or not. When you have finished, I am confident that you will exclaim with Paul: "I know whom I have believed, and am confident that he is able to keep that which I have committed to him against that day."

Now, don't be discouraged if you have not this assurance. Do not therefore conclude that you are not a Christian. Only know that it is your blessed privilege to have it, and be not content till it is yours. "Give diligence to make your calling and election *sure*." "Examine yourselves, whether ye be in the faith." It is your duty to know. Of course, you may be a Christian without this assurance. A letter may be written, and yet remain unsealed. A child may be heir to a large estate, and yet not have the full enjoyment of it. A weak faith saves, though it may not give the assurance of salvation. Many noted Christians have never experienced this blessed assurance. Some one spoke to Archbishop Leighton of his assurance. "No, truly," he said, "I have only a good hope, and a great desire to see what they are doing on the other side."

"You have your feet upon the Rock," said a friend to Wilberforce.

"I do not venture to speak so positively," replied the philanthropist. "but I *hope* I have."

But is it not our privilege to *know* whether we stand upon the Rock or not? "Whosoever *heareth* these sayings of mine, and *doeth* them," says Christ, "I will liken him unto a wise man which built his house upon a rock." Can't we know whether we hear the commandments of Christ, and, as best we can, do them? When Philip de Morray was asked, in old age, if he had a hope of future bliss, he replied: "I am as confident of it from the incontestible evidence of the Spirit of God, as I ever was of any mathematical truth from all the demonstrations of Euclid." Can we not at least attain to a degree of confidence such as this?

Sometimes this comforting ray from the eternal Sun of Righteousness is brighter than at others. Our physical condition sometimes causes despair, as it did to Elijah when he reclined exhausted beneath the juniper bush in the desert, and requested that he might die. The state of one's health, even the weather, often determines whether our view of heaven is bright or dark. Try as I may, I can never feel as cheerful upon a cloudy day as when the sun shines upon the earth. Dr. Alexander, an eminent theological teacher at Princeton, who was depressed by the raw ocean air, when once asked by a student whether he always had a full assurance of faith, replied, "Yes, except when the wind blows from the east."

Defective views of the atoning work of Christ be-

cloud our vision of heaven. Cherished sin, or idleness in the Master's service, causes us to doubt. We must watch out for all these depressing causes. I don't believe in thrashing one boy for what another has done, neither do I believe in *pummeling the soul* because of doubts, when often our frail bodies or the "spring fever" or our stubborn wills or our perverse natures are to blame. Let us at all times keep our assurance of sonship bright and clear. If my observation is worth any thing, assurance makes the holiest Christians, the happiest Christians, the most active Christians, the firmest Christians. Let us pray God that *that* assurance may be ours.

I want to add just a few words concerning a single sentence toward the close of the above. The sentence is this: "Cherished sin, or idleness in the Master's service, causes us to doubt." My experience would indicate that *cherished sin* is the cause of more doubts than any thing else in this world. One who allows his inclinations to persuade him to do that which he knows is wrong, can never enjoy the peace that Christ gives, and can never feel satisfied with his Christian experience. A man signs the pledge, and stands up publicly before his fellow-men, and promises, God helping him, to break away from the sinful habit. As time passes, the old appetite asserts itself so strongly that he turns from his Savior and listens to Satan while he intimates that perhaps it is not well to break off all of a sudden, or something like that. Then he takes just a little, and then tries to hold up his head before Christian people, and to make the world believe that he is enjoying the peace that Christian people ought to enjoy. Poor, foolish, sinful man! He may deceive his fellow-men, but he can not deceive God. It is of no use for him to pray, for we are told in God's holy word—

If I regard iniquity in my heart, the Lord will not hear me. PSALM 65:18.

Of course, there is no *if* about it in such a case, for the sinning one knows he is not a Christian. In the same way, one loses his faith in the Savior by just a little dallying with sin, or a little departure from the narrow and straight path of duty. One quickly loses his peace of mind to a certain extent, and opens the way for doubts and unbelief, by simply letting his mind dwell on the forbidden thing. Probably we are all of beset by temptations, more or less; but if we wish to have a bright, clear faith in the Lord Jesus, it behooves us to bestir ourselves when temptation comes, and to turn our backs at once, with the prayer I have so often told you about, "Lord, help," at the same time keep saying, "Get thee behind me, Satan." The sin of idleness will also bring these very doubts, as I know by personal experience. The true Christian has too many responsibilities pressing on him to waste a moment. May the Lord bless these words to every reader of GLEANINGS who has speculated within his own heart as to whether or not he is a Christian. When I am busy, and when I am cherishing no thoughts of sin in any shape or form, then is my faith brightest, and at such times I am always ready to say, with faith and happi-

ness, the words that I started out with, "I know that my Redeemer liveth."

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, MAY 15, 1889.

Not to be ministered unto, but to minister. MARK 10: 45.

In another column will be found some testimonials in favor of the new Dovetailed hive and its combinations. Not one word of complaint has yet been received from our customers so far.

GLEANINGS ENLARGED.

You will notice that not only the last issue, but the present one, has been enlarged to 52 pages, or 16 pages larger than usual. With the great lot of good matter awaiting insertion, we felt obliged to enlarge GLEANINGS, at least temporarily. What troubles us now is that, even with its present enlargement, there is still a great deal of valuable matter still unused; and, worse still, it may never be used. As we have said before, it is not always the best matter that finds its way into GLEANINGS print. We have on hand several communications in type, and one or two have been waiting for a considerable time in this shape.

QUEEN-REARING IN FULL COLONIES ALREADY HAVING A REIGNING QUEEN.

The *American Apiculturist* for May contains a supplement of 8 pages, the special feature of which is the rearing of queens in full colonies, without depriving the bees of their queen. This result is accomplished by inducing the swarming impulse artificially. It is a well-known fact, that bees will rear cells when possessed of a reigning queen, during the swarming season. In order to make them build cells at other times, friend Alley produces the result artificially by feeding, and bringing the colony into a condition of unusual prosperity. It rather strikes us that the process would be more work than depriving the colony of the queen; but possibly he secures better queens. For full particulars, you are referred to H. Alley, Wenham, Mass.

A CAUTION TO MAMMAS AND PAPAS.

I THINK the following deserves a place as a warning:

Our little four-year-old boy, Harry Huber (named after your own little boy and the blind naturalist), had gone with his mother, sister, and two older brothers, on a visit to "grand-pa's" April 4th. The boys had gone down on the hillside, not far from the house, to play and hunt rabbits as they said. The woods had been burned the night before, and in playing around an old log that was still burning, Harry's dress caught fire and burned off before help could reach him. I was summoned by telegraph; but when I arrived his spirit had departed, and the bright blue eyes and rosy cheeks of my little bee-keeper were patched and charred in death. S. S. LAWING, Henderson, Mo., May 9, 1889.

May the Lord sustain you and your poor afflicted wife, friend L. Perhaps it is not possible to avoid such accidents entirely; but it is well for parents

to bear in mind, when the children are playing out of sight, where there may be fire about, that such things are happening every little while. It seems a terrible thing indeed for such a little one, who did not know what to do, or the danger he was in to suffer in that way. Our children are very fond of playing with fire; and their mamma frequently allows them to do so when they have on woolen clothing that can not very readily burn, and are located where there is nothing to take fire; but even then she keeps a careful eye over them. May be your warning may save the loved ones in some other household, dear friends; and we hope and trust that you are looking to the only solid Rock that can give comfort and consolation during a trial like this.

ENCOURAGING FOR CALIFORNIA.

The following has come to hand from a large commission house in San Diego, Cal. They say:

We estimate the honey crop of San Diego County this year at from one and a half to two million pounds, provided every thing remains as favorable through the rest of the season as it has been up to the present time. LACEY, BAILHACHE & Co.
San Diego, Cal., May 7, 1889.

HONEY STATISTICS FOR JUNE 1ST.

SOME inquiries have come in, asking whether we are going to stop our department of Honey Statistics. Not a bit of it. Blanks have already been sent out, and the statistical reports will be published in our issue for June 1. So far the prospects indicated by the reports are very flattering, and success in wintering has been exceptionally good. We hope that this will jog the memory of those who have so far failed to send in their blanks filled out.

THE WESTERN APIARIAN.

THE above is the title of a new 20-page monthly bee-journal, to enter upon its apicultural career June 1. The size of the pages is to be 6 x 9, and the price is to be 50 cts. per annum. The publishers, Watkins & McCallum, of Placerville, Cal., think that an appropriate time has arrived for the publication of a magazine devoted to bee culture in the Pacific and Western States. As California is the greatest bee-country in the world, it doubtless will be represented by a good live bee-journal. We wish it success.

DOOLITTLE ON QUEEN-REARING.

A NEAT little work of 160 pages, bearing the above title, fresh from the publishers' hands, Messrs. T. G. Newman & Son, has just come to hand. The work is well printed, and, as usual, comes up to the standard of Messrs. Newman's publications. In chapter 3, friend Doolittle discusses nature's ways versus man's ways. We must confess we fail to see wherein the author proves that the swarming queens are better than queens produced by a skilled breeder, when the cells are reared in full colonies. Doolittle may be right; but when "artificial" queens, as he would call them, will give from three to four years of good service, keeping a colony populous and well supplied with brood, we can hardly see what more can be desired. Doolittle says that, when bees are not tampered with by man, they produce queens by only one of two ways; namely, queens produced under the swarming impulse, and queens produced when bees supersede their queen naturally—the old queen having served her best days; but friend Doolittle deviates considerably from nature when he makes artificial cells, fills them with royal jelly, and final-

ly deposits therein an egg or larva. We do not deny but that first-class queens and good queens can be produced in this way; but is it altogether in accordance with nature's way?

Do we not sometimes make a mistake when, in speaking of "nature's way," we leave out of our calculations the human mind? True, no co-operation of the human mind with nature could produce a better snowflake or sunbeam than we get directly from above; but can not the human mind produce more marvelous results with the sunbeam than were ever produced by natural laws without human aid?

Allusion is made above to Doolittle's artificial cells. Chapter 7 (around which all the rest seem to center) discusses the new method of rearing queens, and how these cells may be made artificially. On page 50 is a nice engraving representing a lamp, above which is a small tin vat for holding melted wax. Beside the lamp is a cup of water. Three little sticks of wood (old rake teeth), are lying upon a little block of wood. These teeth are taken from a common bay-rake, the teeth being whittled and sandpapered so as to be as near the shape of the inside of the queen-cell as possible. Three of these sticks are dipped successively into a little of the melted wax, above the lamp. The film is cooled in the cup of water, and is then dipped again. The operation is repeated a number of times until the cell of wax has the proper thickness, when it is slipped off from the end of the rake-tooth, and more cells are made in like manner. After a sufficient number have been made, the end of the cell, or the end opposite from which the queen hatches, is stuck on to a little strip of wood by means of melted wax. After a dozen cells are fixed, this strip of wood is fastened horizontally into an old comb, the space below the strip being cut out so as to allow plenty of room for the cells. On page 56 is a nice engraving showing the cells when fully capped over by the bees. For full particulars, as also a discussion of many important matters connected with queen-rearing, we will refer you to the work itself. The book is full of valuable hints, and will be worth all it costs to any queen-breeder. Price \$1.00 by mail; 6 cents less if sent with other goods by express or freight. It can be sent from this office.

SPECIAL NOTICES.

SWEET-POTATO PLANTS.

Our sweet-potato bed has turned out so much better than we expected, that, aside from supplying our local demand, we shall have several thousand to send off by mail or express. Prices will be the same as our cabbage and celery plants; namely, 5 cts. for 10; 40 cts. for 100, or \$3.00 per 1000. If wanted by mail, add 5 cts. additional for 10 plants, or 25 cts. for 100. For list of all the plants and strawberries we now have ready for shipment, send for our seed and plant catalogue for May.

GERMAN-SILVER THIMBLES.

Perhaps many of you have noticed the very high praise we give our five-cent German-silver thimble in our price list. Well, when I was away in California our clerks got out of certain sizes, and lost the record of where they were to be purchased. But to keep business going they bought some of somebody else that looked a good deal nicer, until—the wash wore off! As a consequence quite a few of our good friends have received brass thimbles, when they paid for and had a right to expect an extra-nice German-silver one. Some of the clerks suggested that it was only a "five-cent deal, any

way;" but I tell you, a five-cent deal ought to be as straight and square as a deal of \$5000. Yes, they had worse work than selling brass for German silver. Our "boss of the counter store" (Eliza as we called her) went and got married last fall; and after that, things got sort o' mixed, and one or two, at least, got brass thimbles in place of coin silver. By way of apology for the blunder, it was urged that the brass ones, when *brand new*, were really handsomer than the silver ones. There is one thing that pleases me, however, in the above: Not one of the friends, so far as I can remember, accused us of purposely sending out a brass thimble; at least, all have been polite enough to suggest that somebody had made a blunder somewhere, when the outside came to be worn off. Well, what I wanted to say is, that we have got a splendid stock of all sorts and sizes, closed end and open end, even the big ones, of genuine first-class German silver, the very best that can be found, and they are only 5 cents apiece. If wanted by mail, add 2 cts. extra for postage and packing.

KIND WORDS FROM OUR CUSTOMERS.

Smokers received. I like the large blast-tube very much. J. GREGG.
Visalia, Cal., May 7, 1889.

The 10 Dovetailed hives that I ordered of you are at hand. I have put a part of them together. I am pleased with them. R. BOSTWICK.
Redding, Cal., April 19, 1889.

THE DOVETAILED HIVE LONG WANTED.

I am more than pleased with the Dovetailed hive. It is the hive I long have wanted, and in the future I shall use only that. F. P. STRAGER.
Bremen, O., Apr. 8, 1889.

THE DOVETAILED HIVE EASY TO PUT TOGETHER.

The Dovetailed hives came to-day. They are so simple I can put them together easily, although I am not a carpenter. Your new A B C book is splendid. B. J. THOMPSON.
Waverly, Wis., Apr. 26, 1889.

COULD NOT BETTER THE DOVETAILED HIVE.

I think you could not better the Dovetailed hive, especially the surplus arrangement, which will save much time and labor in handling and cleaning boxes. The lawn-mower is a first-class machine; it does excellent work, and much cheaper than I could have purchased one here for.

Brink Hill, Pa., May 13, 1889. O. S. ROGERS.

WHAT C. C. MILLER SAYS OF THE WORKMANSHIP OF THE DOVETAILED HIVE.

I have received and carefully inspected the Dovetailed hive; and if it is a fair specimen of the work you will send out, then the Dovetailed hive is a real acquisition. It does me good, just to look at it—so close and exact—no chance to get together any way but the right way. C. C. MILLER.

Marengo, Ill., May 1, 1889.

THE DOVETAILED HIVE THE NEAREST TO PERFECTION; A SUGGESTION.

Eureka! The Dovetailed hive is the nearest to perfection you have struck, including fixtures. Now make the brood apartment the same size as section cases, with open-top section-holders, and you will have every part the same size, and interchangeable. Bees work as well and winter better in a double brood-chamber than in a single chamber with solid comb full depth. The passageway of $\frac{3}{4}$ inch in the middle of the brood-nest is apparently just what the colony needs to shift about without going around outside. My bees came out stronger and better in spring in double brood-chambers than in single, wintered chaff packed out of doors. The double brood-chamber makes a large hive to breed up in in the spring, and can be retained its full size if large brood hives are preferred. Try the *Uniform* hive, and I am sure you will find it more simple than the *Simplicity*, and better than the best. E. E. EWING.

Rising Sun, Md.

The hive material and other goods came in nice order. I was never better pleased with hive material. Mrs. W. says that the tinware and the molding-board beat anything she ever knew of for the money. J. C. WHEELER.

Plano, Ill., Apr. 29, 1889.

We think the carpet-sweeper very nice. My wife says she is almost sorry (not quite) that we got it; for now when she is sewing she will have no excuse for leaving little bits of clippings around on the carpet, they are so easily picked up with the sweeper. JOHN LANGLEY.

Widnoon, Pa., April 25, 1889.

The Waterbury watch you sent in place of the one I told you would not run, I received. I would have sent back the first one; but since I wrote it runs all right. I have two now, and both run very well. I don't know which one to send back, and so I think I will keep both of them. C. HOFMANN.
Harrisburg, Ark.

Brother Root:—I call you brother, as I am trying to serve the same Lord and Master. I can not tell you how much your sermons have helped me the past year, and I hope and pray that you may be spared to continue doing good. L. L. HOWE.
Harrisville, N. H.

Friend Root:—I most heartily agree with you in your concluding sentence in "Myself and Neighbors," for April 15th. May your God-inspired papers be instrumental in bringing hundreds—yes, thousands—to God's heavenly throne, is my earnest and prayerful wish. W. M. BARNUM.
Angelica, N. Y., April 23, 1889.

About five years ago I saw one of your advertisements in some paper I now forget, which induced me to raise bees, and to this day I have had no reason to regret the step, not only on account of the bees that afford me pleasure as well as profit, but principally because I was induced to have dealings with a man strictly honest, who wishes to be measured to by the same measure he gives to others. I would not hesitate to pay \$1.00 out of my pocket for GLEANINGS, when I sometimes read one article worth the price. I always read GLEANINGS from first to last, though I take five other papers, and have my hands full besides. W. W. JONES.
Hubbardston, Vt., April 21, 1889.

GOD'S WORK AND MAN'S WORK.

That 28 cents my due, you may apply on my renewal, if you please. I had forgotten it. Now, brother Root, I believe God made you an honest man, and I will tell you when I think he did it. I think somewhere about 43 years ago.

Mulliken, Mich., Feb. 15, 1889. H. M. BROWN.

[Friend B., God made us all honest. There is certainly no fault on his part. The dishonesty comes because we resist not, but give way to selfish impulses. I was vividly reminded of this yesterday when mamma had a long pull with our six-year-old Huber. He did not want to go to church nor to Sunday-school. Mamma pulled him through, however, and after Sunday-school was over he came up to me saying, "Papa, I am awful glad I was a good boy, and went to Sunday-school. I feel ever so much better now."]]

WHAT AN ADVERTISEMENT IN GLEANINGS WILL DO SOMETIMES.

I just got myself in business when I put that advertisement in GLEANINGS. Letters come from all directions. Some come personally to see me, and I think I shall have no trouble in finding the right man; and, by the way, they were nearly all Christians, and temperate, and anti-tobacco. Bro. Root, I think your readers are the best crowd I ever came across. I see now how much I have missed by dropping out of their company.

GEO. M. KELLOGG.

Pleasant Hill, Mo., March 13, 1889.

[Thanks for the compliment you pay us all, friend K. I have sometimes wondered if it were not true that godly and temperate people were rallying around GLEANINGS. If so, then we, perhaps, in our separate neighborhoods, may be the means of influencing a good many, who are standing undecided by the way, to turn the scale in the right direction.]]

FRIEND JONES'S IGNOTUM TOMATO SEEDS, AND HIS MISHAP.

I received those tomato seeds (Ignotum) planted them in a large pan, and about 20 came up and were growing nicely. I set the pan in the sun on the banister of the porch; after a while, along came a Brown Leghorn hen and concluded to make an examination, and the result was she upset the pan and left me floundering with blasted hopes. Now, you see I am like the calculating milkmaid—visions of delicious tomatoes sliced in vinegar made my mouth water; but now—*mirabile dictu!* I am undone.

REV. L. S. JONES.

Sonora, O., April 15th, 1889.

[Friend J., here is another paper; and as the Ignotum ripens quite early—at least a part of them—I think you may have some tomatoes sliced in vinegar after all, and from your own vines.]

ADVERTISING IN GLEANINGS.

My bees wintered well; I lost 3 colonies out of 75; some, however, were not very strong; and as I work chiefly for comb honey I concluded to unite until I had disposed of my mismated queens (as I wish to have none but purely mated). Thinking it more prudent to sell cheap than to kill them, I had an advertisement inserted in Apr. 1st GLEANINGS. To my surprise, orders came in so rapidly that I could not half fill them all. I knew not what to do but to refund the money. I feel sorry about it, knowing that many of the friends were anxiously awaiting their queen, when, lo! their letter comes in her place. If any who ordered a queen of me did not receive her or the money in her stead, they will please let me know, and I will correct all mistakes. Some had written their address so poorly that I am not sure that I addressed them correctly each time. I make it a rule to fill an order for a queen as soon as I receive it, but as I live a distance from the postoffice I do not get my mail daily; so those who must have a queen "at once" had better not order of me.

L. A. RESSLER.

Nappanee, Ind.

THE SIMPLICITY NOT SIMPLE AFTER ALL.

We have built the largest tunnels on the Cincinnati Southern Railway; have run sawmill after sawmill, cleaned clocks, watches, etc., too numerous to mention, and were always successful; and now in old age we must admit that a Simplicity bee-hive is too much for us; therefore find inclosed \$3.00, for which send me a No. 5 two-story Simp. hive complete, put up, ready for use, to use as a pattern to enable us to use the stuff on hand. I also inclose 70 cts. for two iron gauge-frames, for hive-making. Please send an *exact* copy of those you shipped us, ready for the bees, inside and out. We are greenhorns in the business, therefore please excuse our apparent ignorance. We can't help it. God made us just that way.

Robbins, Tenn.

MRS. E. B. ROBBINS.

[Why, my good friend, do women build tunnels and sawmills, and clean clocks and watches, down your way? or do you mean that you and your good husband are so emphatically one that whatsoever work he is engaged in you know all about? That is just the sort of union that I believe in. I think, however, you will smile when you see a Simplicity hive made up, and see how extremely simple it is.]

OUR GARDEN-SEEDS, ETC.

The seeds came duly to hand, but what packets! eight or ten times as much as we get in the store. I never knew seeds to come so quickly. The beets were up in nine days. I got some of —'s seeds. A packet of early cabbage proved to be four or five different sorts. All came up badly, some not at all. I am sorry to say that the birds took all my white lettuce, my first sowing of Grand Rapids lettuce, all my Ignotum tomatoes but three, and several plantings of beets. They came on to the window-sill to get them. They take every thing as fast as it comes up.

The particulars of your journey to California were very interesting. I worked on the bridges, etc., along those rock cuts on the Rio Grande. I wish I had known, when you were going through San Antonio. I should have been pleased to meet you.

GEO. E. HAILES.

Lytle, Texas, April 4, 1889.

[Several have made mention of the large amount of seeds we give for 5 cents. We try to put them

up in the way the shoemaker charged for mending my boot. We charge about what we should like to have other folks charge us. We are pretty sure that our seeds will all grow, because we are constantly planting them—yes, a great many of them, every month in the year, and we think they are pretty true to name.]

NON-SWARMERS.

I have a nice lot of these fine queens now for \$1.00 each. Safe arrival guaranteed; also satisfaction given in size and color. With me the old queen and her progeny positively refuse to swarm under the most favorable circumstances.

R. B. WILLIAMS,

JAPANESE + BUCKWHEAT.

At the present time, the new Japanese buckwheat is by all odds further in advance than all other kinds. This is the third season that it has been before the public; and the reports to the agricultural press and bee-journals place it far ahead of the silverhull, gray, or common. The grain is larger in size, and it gives a very much larger yield of grain. It is fully equal in quality of flour to any of our old kinds, and very much ahead of them in quantity. The reports for honey are somewhat conflicting, but I believe it yields fully as much honey as any other buckwheat known. The price of the Japanese is as follows: Per bushel, \$2.00; 1/4 bush, \$1.25; per peck, 75c; 1 lb., 10c. If wanted by mail, add 9c for postage.

In lots of 5 bushels or more, \$1.75 per bush. Our seed is going rapidly. Would advise you to order early before we are sold out. See reports in another part of this issue.

A. I. ROOT, Medina, Ohio.

UNTIL FURTHER NOTICE.

Select tested Italian queens, \$1.00. Standard breeding queens, \$2.00. Imported, fine and prolific, \$6.00.

Glass Honey Tumblers and Pails.

Glass Tumbler. Nos. 788 and 789.
Screw-top Pail. Nos. 775 to 778.

Oaken Bucket Pail.

Above we present our three staple styles of glass honey-packages for this season. We are unable to get any more of the screw-top glass pails, shown in our catalogue, such as we have been selling for a number of years, and we have substituted in its place the one shown in the center above. We have this made specially for our trade, and no one else handles it. The following revised table of prices takes the place of those in our catalogue. Please notice important changes, and please be careful to be specific in telling what you want when you order. Give the quantity, number, name, and price, to avoid mistakes.

TABLE OF PRICES—NO CHARGE FOR PACKAGES.

Please order by number and name, and give price.

	Number and Name.	Capacity.	Price.	Barrels.
No. 788, 1/2-lb. tumbler	10 oz.	3	28	2.50 250 85.30
No. 789, one-pound tumbler	16 oz.	3	30	3.00 200 5.20
Nos. 788 and 789, nested		6	57	5.25 200 9.00
No. 775, 1/2-lb. screw-top glass pail	11 oz.	5	40	3.50 250 7.30
No. 776, small pound screw-top pail	14 oz.	5	42	3.75 200 6.60
No. 777, large pound screw-top pail	17 oz.	6	52	4.75 150 6.60
No. 778, 1 1/2-lb. screw-top glass pail	24 oz.	7	65	6.00 100 6.00
1-lb. Oaken Bucket pail	10 oz.	5	42	3.75 200 6.60
1-lb. Oaken Bucket pail	16 oz.	5	45	4.30 150 6.10

In lot of 5 barrels, any one or assorted kinds, 5% discount. Please notice these points in the table above.

1. The capacity as given is what each will hold, well filled with honey of good consistency.

2. The price of one, 10, and 100 is given in the first three columns; the fourth column gives the number in a barrel, and the 5th column the price of a barrel.

3. Notice that it is much the most economical to buy them in barrel lots, if you can use so many. The reason for this is, that all manufactures of glassware have a uniform charge for packages, and a barrel has the largest capacity for the price of any thing used. Every barrel, large or small, costs us 35 cts; a box, holding only half as much, costs the same. Thus by taking the largest barrels, well filled, we can give you the most value for the money.

4. We can not break packages of 100 or barrels at the price of a full package.

5. The most skilled packers are employed, and goods are delivered to transportation companies in good order; we will not, therefore, be responsible for any breakage.

Send your orders early, while we have plenty of stock and can maintain above prices.

SUSPENSERS FOR BEE-KEEPERS.

A number of customers have requested us to get a good suspender for bee-keepers, and a number of kinds have been suggested. The one shown above, called the "Foster," suits us as well as any we have seen. If you notice carefully you will see that, by the use of eveners, or equalizers, the strain on each button is the same. We can furnish them made of good white elastic web cotton ends, at 35 cts. per pair; silk ends, 50 cts. By mail, postpaid, 5 cts. per pair extra. In ordering please call them the "Foster." We can furnish very good white elastic suspenders, without the eveners, at 25 cts. per pair; by mail, 5c extra. Adjustable elastic armlets, 10c per pair, postpaid. A. I. ROOT, MEDINA, OHIO.

P. S.—Have just received some suspenders to sell for 10c that have never been sold before for less than 15c. Elastic web throughout; only 10c; by mail, 14c.

8-6d **W. S. VANDRUFF, Waynesburg, Pa.**

In responding to this advertisement mention GLEANINGS.

BEE HAT AND VEILS.

Most people who handle bees wear some kind of a veil, or bee-hat, as some call 'em. Above we show the rig we prefer. The hat is one we have sold and recommended for two years, and have used for five or six. It is a light cloth hat, weighing only 1 oz.; fits any head, the inside rim having a rubber cord in it. The outside rim is held out in place by a spring wire.

We make veils of four different qualities.

No. 1 is our best veil, made of grenadine and silk brussels net, or tulle face.

No. 2 is the same without the tulle face, being all of grenadine.

No. 3 is made of mosquito bar, with tulle face.

No. 4 is made of mosquito bar, without the tulle face.

	Price—	each.	10.	100.
No. 1. Best veil.....	\$	75	\$6 00	\$55 00
No. 2. Grenadine veil		60	4 75	45 00
No. 3. Tulle-face bar..		40	3 20	30 00
No. 4. Mosquito bar..		25	2 00	18 00
Bee-hat		20	1 60	15 00

Sent postpaid, or with other goods, on receipt of price. Our veils are larger and more roomy than those of other makes that we have seen. They have a rubber cord in the top, to draw them tight around the hat, as shown in cut. The lower edge is bound with a blue ribbon, and is drawn under the suspenders, as shown. The grenadine veils will wear much longer than mosquito-bar.

WHAT TO DO,

—AND—

How to Be Happy While Doing It.

The above book, by A. I. Root, is a compilation of papers published in GLEANINGS in 1886, '7, and 8. It is intended to solve the problem of finding occupation for those scattered over our land, out of employment. The suggestions are principally about finding employment around your own homes. The book is mainly upon market-gardening, fruit culture, poultry-raising, etc. I think the book will be well worth the price, not only to those out of employment, but to any one who loves home and rural industries. Price in paper covers, 50 cts.; cloth, 75 cts. If wanted by mail, add 8 and 10c respectively.

A. I. ROOT, Medina, Ohio.

NICKEL-PLATED "LEADER" SHEARS.

Elegantly Nickel-Plated Steel Shears
At Less than Half the Usual Price.

TABLE OF PRICES.

Postage.		Name.	Prices		
			One.	10	100
5	6½-inch	nickel Leader Shears.....	\$ 20	\$1 90	\$18 50
5	7	" " " " " ".....	25	2 30	22 50
5	7½	" " " " " ".....	30	2 70	26 00
5	8	" " " " " ".....	35	3 00	29 00
6	8½	" " " " " ".....	40	3 40	33 00
8	9	" " " " " ".....	45	3 80	37 00
10	10	" " " " " ".....	50	4 20	41 00

The above are all what are known as straight trimmers, as shown in the cut, except the 9 and 10 inch. Part of these are straight, but most of them are bent trimmers; that is, the bottom of the shear, or bottom blade, is on a level with the bottom of handle. Such large shears are generally used for cutting on a table, and this shape is preferable. We have also a few dozen 9-inch barber shears that will be put in at the same price. These shears are made near here, and we have been in the factory, and have seen them in process of making. The blades are steel laid, and all is handsomely nickel plated. Now you will want to know how we can sell them so cheap. In welding the steel plate on to the blades there will sometimes be a little flaw that can not be all taken out in polishing. These slight blemishes do not injure the shears a particle for actual service, but still they don't like to put them among the first grade of perfect goods. They are kept by themselves, and sold at a lower price. Of course, these goods are not regular stock, and are not advertised by the makers. Therefore whoever takes the lot as they come can get them very low. Having bought so large a quantity, 150 dozen, we got them at our own price, and it is for that reason that we are able to offer the above bargains. Some of the shears are perfect in every respect, except that they lack a full nickel plate all over, and some are so near perfect that you can not see any thing at all the matter with them, and they are all just as good for service as the very best grade.

I. R. GOOD, Nappanee, Ind.

A Four-Color Label for Only 75 Cts Per Thousand!

Just think of it! we can furnish you a very neat four-color label, with your name and address, with the choice of having either "comb" or "extracted" before the word "honey," for only 75 cts. per thousand; 50 cts. per 500, or 30 cts. for 250, postpaid. The size of the label is $2\frac{1}{2}$ x 1 inch—just right to go round the neck of a bottle, to put on a section, or to adorn the front of a honey-tumbler. Send for our special label catalogue for samples of this and many other pretty designs in label work.

CHAS. DADANT & SON,
Hamilton, Hancock Co., Illinois.

In responding to this advertisement mention GLEANINGS.

This is a picture of a rabbit. It is an animal of this species that is overrunning Australia. The rapidity with which it increases is something wonderful. Such rapid increase is not always desirable, let it be among the rabbits of Australia or among colonies in the apiary. And this brings us to the point where we can say

that the BEE-KEEPERS' REVIEW for May discusses "The Management and Control of Increase," and that we should be delighted to be allowed to send a copy to any reader of *Gleanings*. It will be sent free, and with it will be sent the May and July numbers for 1888. Price of the REVIEW, 50 cts. a year. Back numbers furnished.

The Production of Comb Honey is a neat little book of 45 pages; price 25 cts. This book and the REVIEW one year for 65 cts. For \$1.00 the REVIEW will be sent two years, and the book "thrown in." Stamps taken, either U. S. or Canadian.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.*—Our market is bare of comb honey. All cleaned out; in first-class shape for new crop. Same with extracted; no white-clover, basswood, or buckwheat on hand. New Southern honey is coming in fast; a good fair article brings from 6½@70c per gallon. Fine new orange-bloom from 7½@8, on arrival. *Beeswax* scarce; good demand. Will bring from 26½@27½, according to color. **HILDRETH BROS. & SEGELKEN,**
May 25. 28 & 30 West Broadway, New York.

CINCINNATI.—*Honey.*—The new feature is plentiful arrivals of new comb and ext'd honey from the Southern States, where the season had a most prosperous beginning. Demand is fair. Extracted honey brings 5@8 on arrival. Comb honey, 11@16 in a jobbing way. *Beeswax* in good demand, and prices have advanced. It brings 22@24 for good to choice yellow. **CHAS. F. MUTH & SON,**
May 21. Cincinnati, O.

ST. LOUIS.—*Honey.*—Choice white clover honey in 1-lb. sections, single-layer boxes, in good demand at 15. Extracted honey, slow sales at former quotations. *Beeswax*, in good demand, 23. Prospect for much larger yield of honey in 1889 than in 1888. Think fully ¼ better. **W. B. WESTCOTT & Co.,**
May 23. St. Louis, Mo.

NEW YORK.—*Honey.*—Stocks of comb as well as extracted are pretty well cleaned out; some shipments from Florida have arrived, which bring fair prices, owing to its fine quality, and scarcity of other grades. *Beeswax* is scarce; we quote 26@27 for good stock. **F. G. STROHMEYER,**
May 21. New York.

ST. LOUIS.—*Honey.*—We quote bright, good-flavored, strained and extracted, in barrels, 6½@6¾; dark, 5¾@6. Demand good. *Beeswax*, prime, 23, and scarce. **D. G. TUTT GROCER CO.,**
May 22. St. Louis, Mo.

DETROIT.—*Honey.*—Best white comb honey in one-pound sections is selling at 14@15; market very quiet. *Beeswax*, firm at 23@24. **M. H. HUNT,**
Bell Branch, Mich., May 22.

ALBANY.—*Honey.*—Market unchanged. Out of season; nothing selling, and none to sell. **H. R. WRIGHT,**
May 22. Albany, N. Y.

KANSAS CITY.—*Honey.*—No change to report in our honey market since our last quotations. **CLEMONS, CLOON & Co.,**
May 23. Kansas City, Mo.

NEW YORK.—*Honey.*—Comb honey, no demand. *Beeswax*, in good demand at 27@29. We shall have a clean stock for the new. **C. H. KILMER,**
May 21. New York.

BOSTON.—*Honey.*—No change in prices. Sales very slow. **BLAKE & RIPLEY,**
May 22. Boston, Mass.

OUT-APIARIES—NO. VIII.

RIGGING A WAGON FOR HAULING BEES.

THE first moving of bees of which I have any recollection was done in a very primitive manner. The bees were in a box hive. The hive was set right side up (the bottom, of course, open), on a sheet. The four corners of the sheet were tied together over the top of the hive; a pole was thrust through and carried on the shoulders of two men a distance of about two miles, at night. When I commenced hauling my own bees I had a common one-horse wagon, the box of which was about 8 ft. long and 3 ft. wide, inside measure. My hives were Langstroth, with cleats on the sides, making them so wide that two would not sit in the wagon side by side, so I could get only four in the wagon, using one for a seat. I increased the load to seven by putting three on top of the hindmost three. If simply placed on top without fastening, the upper hive would slip off. I made a pair of sticks to place between the upper and lower hive so there could be no sliding. The sticks were as long as the tops of the hives, about an inch wide, and one-fourth inch thick. Near each end, several common big-headed tacks were driven through from each side.

STICK WITH TACKS TO HOLD ONE HIVE ON ANOTHER.

The bottom hive was placed on the wagon; one of these sticks was pressed on top on each side, then the other hive was placed on it, and there was about as much security from slipping as if the hives were nailed together.

But one horse could easily haul more than seven, over good roads. I then made a sort of rack to put on the wagon-box. It is made of fence-boards. Two side-boards rest on the side-boards of the wagon-box, and at or near each end two pieces are nailed in, forming an open box without top or bottom.

RACK ON WAGON-BOX, FOR HAULING BEES.

Then five cross-pieces are nailed on top, and blocks nailed on these to hold the hives in place. Two pieces are nailed on each side (as seen in the cut), which slip down on the wagon-box and keep the rack from slipping off. A loose board in front answers for a seat. The hind end of the rack is propped up, at time of loading, till 3 hives are slid under from behind, then the rack is let down, and the 8 hives loaded on, making 11 hives for the full load. I have a similar rack, only larger, to fit Jack Wilson's milk-wagon, on which, drawn by two horses, I can haul 17 hives. Jack is one of the brothers-in-law worth having, for generally about the time I want to haul bees he seems to have things happen so as to say that he has an idle team that I can have just as well as not. Thus I can take 28 colonies each trip. These are both spring wagons, and, al-

though not absolutely necessary, I like springs, for then you don't need to drive so carefully. A common hay-rack answers very well to haul bees on. Some use a hay-rack with a considerable depth of hay or straw on it, say a quarter of a ton. This acts much the same as springs. It adds to the weight, however, and has the disadvantage that the hives don't sit down flat and regular, but are likely to be in all sorts of shapes. I have used with entire satisfaction a common lumber or farm wagon, with a hay-rack on it, without hay and without springs. Possibly on very rough roads this might not answer so well; but with careful driving I think I would risk it anywhere. I put on a few extra boards and blocks to fit the rack for holding hives. I have seen hives piled on wagons and tied on with ropes, and with some kinds of hives this will answer very well. Indeed, the kind of hives may have much to do with the arrangement for hauling.

Marengo, Ill.

C. C. MILLER.

When we moved our bees to the basswood orchard the boys borrowed our wagon, made specially for carrying fruit and vegetables; and it answered the purpose so nicely that I think we shall have to give you an engraving of it, perhaps in the next issue.

APIARIAN MOSAIC.

PROF. COOK SETS US RIGHT IN SEVERAL MATTERS.

DEAR MR. EDITOR:—I dub this article a "mosaic," as I shall speak of several matters and say but little of each.

I was very much interested in the article from A. E. Manum, p. 340. The clear description, simple, clear style, and familiarity with the subject in hand, are each and all most admirable. How easy it is to tell, simply by reading an article, whether the writer knows what he is talking about! As Mr. Langstroth once said to me, in speaking of Virgil and Columella, "Virgil," said he, "writes as a poet who gleaned his facts at second hand; Columella as one who had handled the things of which he wrote."

In reference to the cardinal flower, as I said before, I never saw a bee on this species of lobelia, though I have often seen them on the blue species. It came to me as a fact from friend Hilton, that bees did really work on it and gathered much fine honey from this source. It seemed to me that there could be no doubt in the matter. The fact granted, then, to quote President Cleveland, "we were confronted with a condition, not a theory." True, as friend Gould says, the corolla-tube of this beautiful flower is long; yet the very fact of the brilliancy of the flower makes it clear that it secretes much nectar. Is it not probable, then, that the nectar may, in times very favorable to secretion, rise up so as to be in easy reach of the honey-bee? I take it that this is just the explanation. Usually there is not enough nectar so that the bees can reach it; occasionally, as in the case mentioned, it rises up so that it gives a bountiful harvest to the bees.

I also believe that fertilization by some bird or insect is quite necessary. True, the wind might bear the pollen to the waiting stigma, but the chance of failure would be too great by far. Aided by insects there is scarcely a chance for failure.

Mr. G. asks about bees eating into flowers, and

really friend Root brings you and me squarely face to face as antagonists, and then asks the old question as to procedure when doctors disagree. I am glad that, in this case, my opponent is so warm a friend. Now, I do not speak *ex cathedra*. I do not say that honey-bees never cut into flower-tubes; but I feel very positive that this is the case. I presume friend Root simply quoted in this case. I have often seen this statement in print. Larger wild bees certainly cut into flowers, and honey-bees certainly avail themselves of such openings. I know this, for I have seen it repeatedly. I have watched very carefully to see honey-bees do the same, and always without success; so both from observation and the habits of bees—they go to open vessels, not closed ones, for their nectar—I feel persuaded that in this case brother Root is wrong. How is it, dear brother? did you write from personal knowledge or from hearsay?

In reply to E. J. Shay, p. 357, I would state that all larval wasps do cap their cells; so do bees. The larval bee first caps the cell, and later the imago, or adult bees, add a second or wax cap. In many families of wasps there is but the one cover to the larva—its cocoon. In the paper-makers, the larva spins its cocoon just as the larval bee does; only in this case the cocoon is thick, and serves exclusively for capping the cell. In the large paper nests, the capped cells will be seen, and, as all know who have observed them, they are very white, and so contrast strongly with the gray of the paper cells. The fine fibrous silk of the larva is white, while the coarse pulpy paper is gray. The mud-wasps cap their cells with mud before the eggs hatch. Yet even here the larvæ spin a cocoon of silk which surrounds them all through the pupa state.

Our bees have been roaring on the fruit-bloom for three or four days. They commence work before it is fully light, before four o'clock. The flowers are being well fertilized, and we may expect a good crop.

A. J. COOK.

Agricultural College, Mich.

Thank you, friend Cook, for the compliment you pay me in calling me a "warm friend," for I hope and verily believe that we shall be warm friends, no matter what may transpire or come up, while God sees fit to let us both live. Your quotation from father Langstroth sounds exactly like him; and I have a great mind to feel hurt, because, right in the next sentence or two, you ask if I did not write from "hearsay." It revived the matter in another column in regard to what the *Encyclopedia Britannica* has said from *hearsay*. Now, old friend, I do not believe it is one of my failings to make statements in print from hearsay. I love nature too well to take the statement of somebody else, when the bees and the flowers are accessible to me almost every day of my life. When I discovered that the article on the cardinal flower had gone into print, and that I had made no reply whatever, I felt a little sad about it; but I am very glad you have straightened it all out. Like you I have seen the bees sucking nectar through holes in the tube, or, rather, little horn, of different kinds of flowers, and I took it for granted that the Italians themselves made the holes. I do not think that anybody ever told me so. As you state it, however, I think that my fault was in draw-

ing conclusions hastily. I never *saw* a bee bite one of the holes; but I have seen them bite and gnaw wood and enameled sheets, and other things much more substantial. Unless something further comes to light in regard to this matter, the A B C will be changed in the next edition. Your explanation in regard to the capping made by larvæ agrees exactly with my own observation. I am glad, friend Cook, that *you* enjoy, as I do, seeing the bees commence work on the fruit-trees *before* four o'clock in the morning.

A. E. MANUM EXPLAINS.

TARRED PAPER TO KEEP AWAY ANTS; LARGE BASSWOOD YIELDS, ETC.

GLEANINGS of May 15 is just at hand; and while I was writing something to appear in its columns for June 15, Mr. Scott (one of my men) was feasting on the good things it contains. When he came to me and asked the privilege of reading me your comments on the use of tarred paper to keep ants at a proper distance, I at once dropped that subject and took up this one in answer to your comments, in order to have it go in the morning's mail.

I do not use the paper in the brood-chamber, but outside of it, and inside the outer case. My hives are all chaff hives. Tell "Mrs. S., down in the lunch-room," to get a strong man to lift the sugar-barrel (as I suppose it is full, as all are liable to be when near a cook-room) while she slips a large piece of the tarred paper under it. The paper should be larger than the bottom of the barrel. Do not throw the paper into the barrel, as you propose. If that does not keep them away, tell her to sprinkle fine salt around the barrel.

SPECKLED TROUT.

I did write one page, telling all about our trout-fishing, but finally left it out, as you had requested me to be as brief as possible. I find it difficult to tell your readers all I wish to in the space you allow me.

VERMONT BASSWOOD; LARGE YIELDS PER COLONY.

You ask on page 402, about our basswood range. I do not think that my location is one of the best for basswood honey, and it is one of the poorest for clover of any that I know of in Vermont; yet in a favorable season it is not uncommon, in the height of clover-bloom, for our scale hives to register 8, 10, and 15 lbs. per day for a very few days. But remember, we aim to have large swarms; we work hard from early spring up to clover bloom to induce queens to lay a large number of eggs. Our basswoods are principally at the base of our mountains, and not as far up on the mountains as Bro. Doolittle's are, hence our basswood seasons are not as prolonged as his are. There are a goodly number of basswoods scattered among other timber in the valleys and over the foot-hills; but this is being cut off very fast. One factory here in our town bought last winter over 300,000 feet of basswood logs. All were cut within range of my bees, hence I may not be able to report 33½ lbs. per day this season, although I shall try hard to secure 50 lbs. in one day. If I do succeed in reaching 50 lbs. I will tell you how it is done. It is all to be gathered by one queen's progeny.

I hope, Mr. Root, you will some day favor us

Vermonters with your presence; and if you should visit us in the trout season I assure you we will try to give you a feast on speckled trout, and will try to fill your pockets with spruce gum to take home to the children. And I now invite you and yours to make us a visit whenever you can spare the time.

Bristol, Vt., May 21, 1889.

A. E. MANUM.

Thanks, friend M., for your kind invitation. Possibly I may be able to call on my friends up your way next season. This fall, you know I am to look over Wisconsin and the adjacent territory. In regard to basswood-trees, I do not feel satisfied, because there are so few planting them. Our trees are now looking very handsome, and Ernest has got into pretty fair running order what we call the "Basswood" apiary. My dreams of 17 years ago, we expect are to be realized this season; i. e., seeing bees store honey from trees over their own hives, and said trees to be of my own planting. Unless we do plant basswood groves, bee-keeping, to a large extent, must go down. Now, brethren, please remember that these are the words of Uncle Amos.

A BIG TESTIMONIAL IN FAVOR OF PERFORATED ZINC.

SHALL WE DESTROY GOOD DRONE COMB, OR USE IT WITH PERFORATED ZINC?

AFTER reading what my neighbor L. E. Mercer said (see page 358) about zinc honey-boards, I started for the apiary to see how the one I got from you by mail this spring was doing. I put it on over a rather small but prolific queen, and filled the super with part drone and part worker comb, and this is what I found: The super was about half full of honey. The drone-cells were empty, and cleaned up for the queen to lay in. The brood-chamber of 8 combs was full of brood to the top-bar, and one outside comb was half full. There were about two dozen drones. I vote the queen-excluder economical and humane. If the queen had been allowed to go above, they would have wasted many pounds of honey in raising thousands of drones; and after extracting the honey I should have shaved the heads off those drones, which is a cruel and expensive practice. I was afraid they would make the bees swarm more, but now I think different; for the super-gives plenty of room for all the bees that can be raised in the brood-chamber. My hives are ten-frame Langstroth, and the bees usually fill 8 combs in the brood-chamber and the lower half of the combs in the upper story with brood before extracting commences; but the queen is soon crowded out of the super combs by the honey. This is contraction, but I sometimes wish the brood-combs were as deep as the Quinby frame, so the queens would not need to go above for room. This might do if all the super combs were built on foundation; but in buying bees I have got a lot of nice straight drone-combs which are splendid to extract from, if the queen could not get to them. Now, the great question with me (and I wish you would pop it to the veterans this season) is, whether to melt up all those drone combs, perhaps 2000, and put foundation in the frames, or put a queen-excluder over the brood-chambers and keep the drone-comb.

THOSE ORANGE-TREES; THE IGNOTUM TOMATO.

I have just sold that little patch of seedling orange-trees that you were admiring when here—1000 trees grown one year in the seed-bed and one year in nursery rows, for \$175, and have enough seed planted to raise from 10,000 to 15,000 more. I received 33 Ignotum tomato-seeds, and have 33 nice plants, transplanted and growing in the garden. That seed is good. J. F. MCINTYRE.

Fillmore, Cal., May 10, 1889.

I am very glad indeed, friend M., that the perforated zinc honey-board works so well in your hands. I think I should use the drone comb, by all means; in fact, a good many prefer drone comb to worker for extracting. I am inclined to think that the bees can store honey faster in drone comb than in worker comb; and I also believe that the honey is thrown out more easily with the extractor. The only objection that I know of is the liability of getting drone brood; but the perforated zinc board ought to remedy this entirely.—I am glad to get your report from the orange-trees. Now, this is one of the mysteries that I can not understand. The demand for orange-trees is large, and yet the prices are what I should call away up. Now, notwithstanding this, thousands of people are found all over California, wanting something to do; in fact, I am afraid that a great many of them went to California just on purpose to get a job, as they could not get one at home. I think my talk on the subject in our last issue pretty nearly solves the problem.—If you got 33 tomato-plants from that little paper of seed, I think that you too, friend M., must be an adept in making seeds grow. May be your good wife kept an eye on them. Give my respects to the little girl who climbed the mountain with her doll-baby, a good deal faster than I could do it with both hands and feet, and all my strength.

FROM DECEMBER TILL MAY.

A REPORT FROM THE GREAT BASSWOOD REGION OF WISCONSIN.

TO-DAY is about the first day that it has rained this season to prevent work, so it gives us opportunity to make a short report at this end of the route. May 18th, and 80 colonies not looked over yet this spring to crop queens or regulate frames. How is that for a modern bee-keeper who takes five bee-papers, and keeps 300 colonies of bees? I am aware that it is a good plan for a bee-man to look over his bees every month or two. I have tried to do so, but in an evil hour I listened to the advice of those who counsel a bee-keeper to have some other business to fall back on, that, in the event of his bees failing during off years, he would have some other string to pull, or some other source of income to provide for his family and keep the wolf from the door. Had I taken the advice of A. I. Root on this point, which was given somewhere in GLEANINGS, all would have been well. His advice was, to put money in the bank, where we could have it handy to draw on to tide us over during poor years. Instead of acting on this sensible plan, after considerable thought I went into the nursery business on a small scale, adding a small orchard, grapevines, small fruits,

etc. Now be it known that this nursery business will take the cake for keeping a man employed 13 months out of the year. To explain how it gets in 13 months, I will say that he can hoe all summer, graft all winter, and in the months of spring and fall when he delivers his stock he will have to do two months' work in one, so that will make the 13 months. The above will explain why I have neglected my bees until this late date. Customers had to have their trees, vines, and plants, at the right time, so bees had to take their chances. Now, if any dissatisfied bee-keeper wants to exchange his bees for nursery stock let him come forward, for I am anxious to have one job or hand, and have the satisfaction of having things done in time. I was unable to visit my bees previous to last week, excepting two or three times, giving them a hasty examination, and feed where necessary to prevent starvation, being all the care they got since taking them out of cellars March 19th and 20th, excepting 60 colonies that were left in six days longer. I see no perceptible difference between those taken out first and those last. Bees have wintered well in this county generally. Mine were too warm all winter. The Sextonville lot, 219 colonies, would have made a good hot-bed if we could have utilized the heat. They were so warm that they dried up all of the moisture on the walls, and would probably have dried the sand on the bottom of the cellar if it had not been covered with dead bees. I don't see how Mr. Barber keeps his bees at a temperature of 70 or 80. Mine at 55 to 65 came out poorly. Many colonies were weak when set out, and quite a number worthless; but they had no spring dwindling. All that were good when taken out are so yet, showing that a high temperature will not hurt bees in a winter repository, if they will stay in the hive.

Up to date I have 318 colonies with queens, out of 350 put in winter quarters. They average better than last year. They have used honey rapidly this spring. We have fed several hundred pounds of reserved comb honey, in going over them this our first time. If they should need feeding again before clover, I shall have to resort to extracted honey, of which we have 1200 lbs.

The prospect here has been rather poor for clover, as previous droughts have caused a light stand; but the present rains may bring forth to advantage all there is of it. In all of my experience with bees, over 30 years, I have never known bees to swarm in April but twice. Last April was one of them. Several swarms were reported the last of the month in this county. My first and last swarms were the 4th of May. We had after that a cold and windy time of ten days duration, which checked all inclination to swarm. I see by reports from all parts of the country that a booming season for bees is confidently expected. Bees are in splendid order; white clover is coming on finely; and being the full year for basswood, a large honey-yield is anticipated. If it comes in as well as predicted, where shall we sell our honey? Judging from the way the small crop of last year filled the market, where can we find an outlet for a large and general crop? It looks as though a large crop in 1889 would put the price down where poor folks could eat it. For one I am not disposed to sell mine cheap until I see it. Eleven years ago, 1878, bees swarmed in April. They had wintered as well or better than last winter. It looked as though we were going to have an exceptionally fine season; but up to September 1st, bees

in this location had not gathered enough stores of winter on; but afterward they got a little run, which gave most colonies enough to winter on. It is too early to predict as to basswood and mint. I will report later.

S. I. FREEBORN.

Ithaca, Wis., May 15, 1889.

Judging from the above, friend F., basswood does not always yield, even in your favored locality. In our locality, the weather during fruit-bloom was more favorable than I remember to have ever seen it before. I am looking forward with considerable interest to my visit when your basswoods are doing their best.

FALSE STATEMENTS IN REGARD TO THE HONEY BUSINESS OF OUR COUNTRY.

As a protection to our bee-keeping population, we propose in this department to publish the names of newspapers that persist in publishing false statements in regard to the purity of honey which we as bee-keepers put on the market.

THE SAME OLD STORY.

FRIEND ROOT:—Inclosed I send you an article which adorned (or darkened) the columns of the *St. Louis Christian Advocate* of May 15. O my brother! how long is this great wrong to continue unrestrained? Not only is it damaging to us as bee-keepers, but it is ruinous to our influence as Christian people. Is there no way by which this iniquitous tide of envy, malice, and hatred may be checked, and we as a God-loving and God-fearing people be allowed to quietly engage in a pursuit which is in every way calculated to lift up, elevate, and ennoble those who engage in it?

SARAH E. DUNCAN.

Lineville, Ia., May 17, 1889.

I think exactly as you do about it, my good friend. The way such falsehoods are passed around looks bad for the community in general. There is a great deal too much "thinking evil." I will explain to our readers, that the paragraph sent us, alluded to in the above, is exactly the same thing as is found on page 81 of our issue for Feb. 1. It does seem sad indeed, that two such papers as the *Lutheran Observer* and the *St. Louis Christian Advocate* should be guilty of such wrong and injustice. If it were a blunder, why can they not for Christianity's sake, if for nothing else, set their readers right with a suitable apology?

THE ENCYCLOPEDIA BRITANNICA, AND ITS MANUFACTURED COMB HONEY.

I have just received my third volume of "*American Supplement*" to the *Cyclopedia Britannica*. By accident I first opened the book at the word "glucose," page 537. Beginning in the left-hand column, 21st line from the top, I read as follows: "Glucose is used chiefly in the manufacture of table syrups and confectionery, in the brewing of ale and beer, and to some extent as food for bees and in the making of artificial honey. No reliable statistics can be had as to the quantity used in brewing, since brewers seek to conceal the fact of its employment. When it is fed to bees, the honey yielded by the bees is almost pure glucose. In artificial honey-making, the comb is made of paraffine and filled with pure glucose by machinery. For whiteness and beauty it rivals the best white clover honey, and can be sold at less than half the

price. Its one defect is, that it is not honey." Chas. Morris, of the Philadelphia Academy of Sciences, is the accredited author of the above statements. After reading the article, my opinion of the Britannica's accuracy was lowered about 100 per cent, and I certainly would never have purchased it had I read the above sooner; for, if containing such strikingly erroneous statements on this subject it could not be thought reliable on any other, unless further examination proved to the contrary.

C. NYSEWANDER, M. D.

Des Moines, Ia., May 12, 1889.

Why, friend N., it is absolutely awful to hear that this false slander that you mention on our industry has got into a cyclopaedia. The address of the publishers is J. M. Stoddart Co., Limited, Philadelphia, Pa. We shall write to them at once, sending them this statement, together with other facts in the matter, and our card offering \$1000 reward, etc.; and I heartily wish that we could persuade every bee-keeper in the land to write them a protest. Have it scattered far and wide; and, if it is a possible thing, make them paste some slips of paper, setting forth the truth, over this paragraph, in every volume published. Besides doing this, the publisher should send a circular to every one who has purchased a volume. I do not believe in "boycotting," as the term is generally understood; but I do believe in putting a stop to this matter of publishing hearsay as science. If somebody should step on your corns you could forgive him, because he did not mean to do it; but if he continued to blunder in this awkward way, day by day, he should be fined, and, if need be, imprisoned until he learned to be careful. Now, then, let us wake up and make ourselves heard. Had we not for years been at work in the matter, there would be a more reasonable excuse for the Britannica folks to say they did not know any better. If the man who writes about bees, for an encyclopaedia, has not enterprise enough to hunt up some genuine bee-men among his acquaintances, in his vicinity, he deserves to suffer.

SOME GOOD SUGGESTIONS FROM FRIEND POPPLETON.

TIMOTHY CHAFF VERSUS MANY OTHER KINDS, ETC.

FRIEND ROOT:—The contents of May 1st *Gleanings* suggests a few ideas, most or all of which are old ones, but seem to be new to some of your readers. On page 340, friend Manum advises against spreading the brood as early as May 10, but thinks it well to do so during the honey season. My idea is exactly the reverse of this. We want all the bees raised that is possible before the honey-flow, and as few as possible during the flow. I have followed this practice nearly ever since commencing bee-keeping, and have found it good. I am in thorough accord with what friend Doolittle says on this subject, on page 352.

On page 364, Ernest tells of starved bees on account of a cold snap. Did this occur in your chaff hives? If so, you have had an experience that I never had in my dozen years' use of such hives. I have frequently contended that chaff hives are worth all their extra cost, for this feature alone.

I was surprised to see on the same page that you and others have only just dispensed with loose chaff over your bees. I supposed I had called your attention to this point years ago, in the columns of GLEANINGS, but I may have overlooked doing so. Don't make the cushion a little but a good deal larger than the top of the brood-chamber, and a clear space should always be left between the top of the cushion and cover of the hive. This prevents accumulation of moisture.

On page 360, friend Freeman asks some questions about timothy chaff being suitable for packing bees, and in your foot-note you say you "suppose any thing of that sort will do about as well," and you "think timothy chaff might be a little more apt to pack down tight and get moldy." Please excuse me if I say that you are decidedly wrong in both of those ideas. You will find a column article from me on this very subject in GLEANINGS for 1882, page 326. During the first years of experience with chaff hives I tested all the different materials for packing that I could get conveniently, and found them of value in the following order. 1. Timothy chaff; 2. Fine sawdust from dry pine; 3. Wheat chaff; 4. Oat chaff; 5. Buckwheat chaff. I never tested ground cork, but I think that would be superior to all other material. I found that timothy chaff, freed from straws and other coarser materials, would remain dryer during winter than any of the other materials would, showing that it gave better protection from the cold than did other materials. Oat chaff seemed to have a wonderful affinity for moisture. I presume that many failures in the use of chaff hives have resulted from the use of improper materials, or from not using a sufficient quantity of packing. To be successful in the use of chaff hives requires the use of proper materials, of skill, care, and judgement, the same as does the use of any other method of wintering.

In your notes to question 121 you speak of so few saying any thing about seeing swarms go off without clustering at all. The question gave no suggestion of this point, or more could have mentioned it. I knew at least two instances of such in my own apiary. One of them, a prime swarm, commenced to issue while I was standing close by the hive, and I saw it start directly for the woods. It spent no time fooling around in the air, as swarms usually do before clustering.

On page 355, friend La Montagne tells of a large flow of honey from orange-bloom. I have spent four springs in Florida and two in Cuba; have watched the orange-blossoms very closely; have made many inquiries, but have never seen, and this is the first I have ever heard, of such a flow of honey from orange-blossoms. They yield more or less honey, of course; but I judge much less than is done by fruit-blossoms in the North. It would not be wise for any one to commence bee-keeping anywhere on the strength of large expectations of honey from orange-flowers. O. O. POPPLETON.

Havana, Cuba, May 15, 1889.

I felt pretty certain, as you say, that honey from orange-blossoms is rather an exception than the rule. When our attention was first called to the matter of bee-keeping in Florida, there was considerable said about orange-blossom honey; but as years passed, and no considerable quantity was reported we began to think it was a mistake. When friends Baldensperger, how-

ever, on the Mediterranean, gave their report we were forced to conclude that the orange-trees on the Mediterranean produced honey, whether the rest did or not; and now we are glad to know that pure orange-blossom honey is a reality and not a myth. I think, however, that, on account of its rarity and excellence, it ought to command an extra price. We are going to try to get an extra price for what we purchase, if we can. If we can't, why, I suppose demand and supply will have to fix the price. —In regard to the starved bees spoken of by me (Ernest), I would say that the colonies in question were in regular two-story chaff hives. As I stated on page 364, the bees and brood were on one side of the brood-chamber, and the honey on the other. The colonies were average in size. They had reared so much brood that all the bees were required to cover it; and during a cold snap of weather they refused to abandon it. We have had this thing happen repeatedly, though the loss from this source is comparatively slight. I can not explain why you never had such an experience; but, as usual, I shall have to lay it, in the absence of any thing better, to the door of "Locality." Our proof-reader says, that the next time we must lay up to, "electrical conditions." In regard to the timothy chaff and dispensing with loose chaff, you doubtless called our attention to the matter, but, like many other good things, it "got overlooked" in some way. Even editors can't remember all that has been said and done in times gone by, but they are glad to have good friends remind them.

WHY DO BEES SWARM?

WHAT SHALL WE DO TO MAKE THEM LESS LIABLE TO SWARM?

I WAS interested to an unusual degree in reading the replies to questions 125 and 126. Years ago many were asking, "How can I get the most increase from my bees?" Lately, the matter of *preventing* increase has been much discussed. Some have gone beyond that, and care little to know how to prevent increase, but are very anxious for an answer to the question, "How can I best prevent swarming?" I think you will find this question coming very prominently to the front in the near future, especially if out-apiaries continue to increase. Now, questions 125 and 126 have a bearing on prevention of swarming; for if we knew exactly where the swarming impulse originated, and the necessary conditions to induce swarming, we might the better know how to avoid those conditions. I know very well that there is a common belief that better results can be obtained by allowing swarming, and that no other colony works with the same vigor as one newly hived. Whilst this *may* be true, I don't believe it is. At least, I think it possible that we may learn to prevent swarming, and at the same time get just as much surplus. But, you say, swarming is *natural*, and we must follow nature. I believe in following nature, probably, about as far as any one; but even those who cry out most loudly for nature, don't let every thing follow its natural course. Let's see: "It's natural for bees to swarm, so we must let them swarm."

All right, my friend; but it's just as natural for the swarm to go off, so we must let it go off. At any rate, I think I would give more to find out the best possible way to prevent swarming than to find out any other one thing connected with bee-keeping. In the answers given to the two questions, there is considerable agreement. Only in the last answer, Hasty starts off on a track all by himself, and says that there is probably only one necessary condition to induce swarming—"a turgid condition of the vessels in the bee anatomy in which are stored the supplies for future brood-rearing." Is the man crazy, or only a natural born fool, to fly off in that sort of style? Well, if you take Hasty for a fool you are altogether too *hasty*. I confess I had never thought of just the reason that he gives for swarming, but I *had* thought about some things closely connected therewith. I think generally, if not always, the hive from which a swarm has issued for me, has been found to have an unusually large quantity of its brood *sealed*. Have others found this to be generally true? If so, Hasty's theory would say, "The bees have been feeding a large quantity of brood, and somewhat suddenly they find the brood all sealed, little young brood to feed, and no place to dispose of the food they have secreted in such abundance for the larvæ. So, in some way, this engorgement leads to the swarming fever." I once had a colony swarm when put on nothing but foundation, leaving nothing in the way of brood except one egg in the queen-cell. They had been baffled several times in the attempt to swarm, each time having a part of their combs taken away. Perhaps Hasty's theory, if I have interpreted it correctly, might apply to this. It is commonly believed that a young queen is much less likely to swarm than an old one. Try Hasty's theory on this. If a queen from old age should suddenly drop off in her laying, the nurse-bees are checked in their feeding, and engorgement occurs. But I have had a young queen swarm before she had been laying a week. Say No. 1 with an old queen swarms and is returned to the hive, and the queen replaced by a queen taken from No. 2, this latter queen having just commenced laying. If the swarm issued because the cells were filled with sealed brood, a change of queens does not make any difference in the condition of the turgid vessels, and this young queen comes out next day with the swarm; whereas if she had been left in No. 2 she would not have swarmed that year. As a general rule, a young queen is not so apt to swarm; but is it not because, commencing later in the season, there is never that condition of affairs in the brood-chamber that prevents the nurses from disposing of all the food they have prepared? Here's an experiment that might be worth trying: From a colony that has just swarmed, take away its frames of sealed brood and give it frames of unsealed brood, either before or after the swarm with its queen has been returned, and see whether it will swarm again. I have failed so many times in trying to thwart a swarming colony, that I am not sanguine about the success of this experiment. Indeed, I'm not sanguine about ever knowing how to successfully prevent swarming; but I'm anxious to learn all I can about it.

Marengo, Ill., May 22, 1889.

C. C. MILLER.

Friend M., I once gave you quite a talking-to for using rough language when you were in fun, and I feel just like scolding you now. I remember very well indeed

that queer expression of Hasty's. I said to myself, "Well, what does the fellow mean, any way?" but I afterward reflected that Hasty is by no means one of the kind who purposely mystify. I did not follow the idea very much, but I did have a dim impression something in the line you have interpreted it; and I believe you have got it about right. The bees swarm because they are in the right condition, and all loaded up, as one might say, to raise great quantities of brood, and, lo and behold, there is not any brood except that which is sealed; and oftentimes there are not any cells to clean out, that the queen may start some more. At this crisis the house is too small; the accommodations are altogether too limited, and without relief in some direction the great business of populating the world with their own kind must come to a standstill. Nature herself has made provision, as she always does, by a sort of safety-valve. When the pressure gets up to the proper limit, open goes the valve, and off goes the steam in the shape of myriads of bees pouring out over the hives with a great jubilee, all hands eager for the new enterprise. Now, good friend Hasty, I beg pardon for taking the matter out of your own hands, and putting my own interpretation on it; but I have done so, taking it for granted you would supply the missing links, and set me right where I am wrong. Now *you* have the floor. If Dr. Miller says any more saucy words, I will scold him some more.

WINTERING BEES OUTDOORS.

PLENTY OF STORES, AND PROTECTION FROM WIND,
PRIME ESSENTIALS.

I WILL mention a few things that I think we must have, to insure success. We want some sort of a windbreak, such as a good grove of timber or high hills, or a high board fence. It is hard on the bees to have a strong wind blowing into the hives in cold weather. In the spring time, when the bees come out for a fly they should be protected from the wind as much as possible. Then for me I want a quadruple hive, chaff lined all around the sides and over the bees. Putting four hives together is a great help to save heat and keep the little folks comfortable.

But the most essential of all things is an *abundance* of something good to eat. *Good* honey is good enough, if there is enough of it. I am satisfied that we have lost more bees (since I commenced keeping bees) by scarcity of honey to winter on than from all other causes combined. Our motto from this on will be, that a great deal too much honey is just enough. There is nothing lost by letting them have more than they will use up. If it is not all used up before we start the extractor, the next year we will get it then. Bees won't breed up fast in the spring if they are short of feed. They may pull through in a weak condition, but be of no use as far as gathering surplus is concerned; when if they had had plenty of feed in the spring they would have built up strong and been a profit to their owner. Now, I believe in feeding during the spring months, if I have to, to save the bees and build them up for business; but I don't like to be obliged to do it. I don't like to be feeding bees in

the spring of the year. I want the hive to contain feed in the fall—enough to last them until white clover will give them a living the next summer. The best time to get the honey in the hive is when the bees are gathering it from the flowers. We have to give our bees their winter supply from the basswood, as, after that, our location will give them only enough for their living, and sometimes not that. Now, to extract all the honey we can, and at the same time not take too much and leave the bees short, is a nice point to decide.

We sometimes get caught on account of rainy weather at the close of the basswood season, and have to feed back, if we find the bees are short of winter stores. The earlier we feed back, the better. During the last of August or first of September it is better to give the bees more than we think they will use; for we can not tell what kind of a winter we are preparing for, but give them enough. It won't do any hurt if they have more than they can use. If they don't use it up we shall get it the following spring. Bees will stand a great amount of cold, if they are out of the wind and have plenty of feed over them. I want my bees to cluster on empty combs below the honey. They will follow the honey up as they use it.

During the fall of 1887, about the first of September we looked over our bees to see if they had plenty to carry them through the winter. We found one yard of 70 colonies, that did not have as much honey as we wished they had, but concluded they would do until spring, and then feed if we had to. We missed it, for that yard came through the poorest of any we had. The bees were weak, and had but very little brood. The honey was scarce, and we fed 500 lbs. As a result, the bees got into good working condition late, and that yard gave the poorest returns of any we had. Better fed in the fall.

E. FRANCE.

Platteville, Wis.

I quite agree with you. I have never seen any bad result follow from having too many bees or too much stores; and I am confident that bees base their calculations, and go to work somewhat in accordance with the amount of stores they have to back them up. In our locality, like yourself we seldom have any thing of any account after basswood closes.—Windbreaks are of very great importance, not only for bees, but for farm stock and plants and crops.

PYRETHRUM AS AN INSECTICIDE, ETC.

BEING CAREFUL TO SAY, "I DON'T KNOW," WHEN
IT OUGHT TO BE SAID.

MR. EDITOR:—You ask if pyrethrum would not kill the itch-mite; and you add that it kills all kinds of insects. This is a mistake. Pyrethrum does not kill many bugs and beetles. I have tried repeatedly to kill the squash-bug with bubach, or California pyrethrum, but with no success. Bubach, in that it is entirely non-poisonous to higher animals, is one of our best insecticides; in that it does not always kill the insects, it is objectionable. I should hope that it would be fatal to the itch-mites; but they are so

concealed that possibly it would not molest them at all. It is very quickly fatal to higher insects, like bees, ants, wasps, flies, and moths and butterflies.

CARE IN GIVING STATISTICS.

Some time ago a report from the Department of Agriculture stated that the chinch-bug had done serious damage in five counties in Michigan. I did not believe this was true. In all my collecting I never yet took a chinch-bug in our State. In one of these counties I had lived, and I was certain there was an error. So I wrote to the Department, and learned the names of the reporters. I at once addressed each a letter as follows: "Do you know the chinch-bug? Do you personally know that it has ever worked in your county? Why did you report ravages from this insect in your county to the Department of Agriculture?" Three of the persons answered. The other two paid no attention to my inquiry. The three reported that they did not know the insect; that they had no personal knowledge on the subject, and did not know that they had so reported.

What are statistics worth, if we are to have such reports? If we don't know enough to answer any question, why not say so? It seems to me that such answers are seriously mischievous. Now, I was reminded of this in reading answers to Query 125, p. 411, GLEANINGS: "Does the swarming impulse come from the queen or workers?" I like the two first answers: "I guess so." We should know that our humorous friend from Toledo got that off, and spontaneously too. The next writer says, "I don't know." Of course, he doesn't. No one does. One says, "From the workers;" another says, "First swarm from 'workers, second, etc., from queen." Now, I don't like these answers. Why say just how, when no one knows? I believe friend Doolittle answers correctly, but I don't see how he can speak so positively.

Now, I do not wish to criticise, only to suggest that we all say, "I don't know," or "I think," in all cases where we have not positive knowledge. In such cases as the above we can at best only give opinions.

A. J. COOK.

Agricultural College, Mich.

Friend C., I am exceedingly obliged to you for both pieces of information. It has been so repeatedly said, especially by advertisers, that pyrethrum kills *all* insects, that I had somehow taken it for granted; and yet I ought to know that it does not kill flea-beetles nor the striped squash-bug; but I supposed it was because I could not give them enough of it. Where flies, mosquitoes, moths, and every insect I have found in our rooms, were treated with the dust-bellows, they always died promptly, and I thought that perhaps these other fellows would also die if we could get them shut up in a room.—In regard to your remarks about saying we don't know, I am going to try to profit by it. But let me suggest that some of the brethren *thought* they knew. As an illustration, I once thought I proved beyond question that the queen leads out the swarm; but pretty soon I had just as plain proof that bees lead out the swarm. First, I *knew*; and then after a while I didn't know. Perhaps it will be well to say we *think* we know, and then give our reasons.

GETTING BEES TO WORK IN SECTIONS.

SOME TIMELY HINTS FROM FRIEND DOOLITTLE IN REGARD TO THE MATTER.

A CORRESPONDENT from Pennsylvania wishes to know how he can get his bees to work in sections when they refuse to do so, and asks, "When the bees refuse to work in sections, and crowd the queen by placing too much honey in the brood combs, can they be made to go into the sections and work, by placing uncapped honey in the brood-nest?" As this question of getting the bees to work in the sections is an important one, and thinking an answer to it might be of interest to the readers of GLEANINGS just at this time, when we of the North are about putting on sections, I will answer the correspondent through your columns, Mr. Editor, with your permission, as the correspondent says he is a subscriber to your paper.

Of late years the idea has prevailed, in some minds, that all that is necessary to get the bees into the sections, is to reverse the combs in the hive so as to get the honey which is generally in the tops of the frames, at the bottom, so that the bees would uncup the same and carry it up into the sections; and I presume that this is in part what gave our correspondent the idea he has of placing unsealed honey in the brood-chamber. I have had very little experience with reversing frames, that little being against the process, except so far as the getting of the combs built out to the frames all around was concerned, but I have tried several times to get the bees to work in sections sooner than they otherwise would, by uncapping the honey which was in the hive and changing the fullest combs to the center of the hive. One year I had three very strong colonies at the beginning of the honey harvest, which had more honey in the brood-chamber than I thought they should have; and being anxious to secure as much honey as possible in sections, I thought to make them take this honey from the brood-combs into the sections by the plan suggested by our correspondent. So I went to work and uncapped all of the honey in one of the hives, at the same time taking away two combs of brood, and placing, instead, two frames which were full of honey, after uncapping it. Not to be badly caught, I thought I would do this a day or two before I served the others in the same way, to see how the plan worked. In less than an hour the most of the bees were on the outside of the hive, badly daubed with honey, as the weather was quite warm at the time. The next morning the most of the bees were in the hive again, but there was no work being done in the sections; only a few bees loafing about there. The third day I opened the hive to see what had become of the honey, and, behold, quite a share of it was being sealed up again, and nothing in the boxes, the bees having changed it about only a little to get it in the part of the hive where they wanted it. Thus failing to accomplish what I desired to, I went to one or two colonies which had commenced to work in sections nicely, and took two boxes of sections, bees and all, and placed them on top of each of these hives, and, to my delight, comb-building was commenced in the other boxes within twenty-four hours, which work soon spread to the whole part of the sections. When the sections were two-thirds full, I examined the hives, and, to

my surprise, I found that the bees had unsealed and carried to the sections one-half of the honey below, and in place of it there were plenty of eggs and larvæ. Thus I learned that bees could be coaxed into sections more easily than they could be driven. Although this was several years ago, yet in every trial which I have conducted along this line, the results have been fully as unsatisfactory where I tried to compel the bees to carry unsealed honey from the brood-chamber into the sections.

One other thing which I learned, and a thing which later experience has confirmed, is, that when bees are at work nicely in sections there is no danger of the queen being crowded with honey in the brood-nest. Now, suppose I had extracted the honey from the brood-nest, as some would have us do when bees refuse to work in the sections, what would have been the result? They would have simply filled the space again, not going into the sections at all, for the simple reason that there was no need of working in the sections as long as there was plenty of room to store honey below. I have so far failed entirely to get extracted honey and section honey from the same colony of bees at the same time; and if any one can succeed in doing this, I confess I do not know how it is done. This extracting from the brood-chamber when working for section honey is very much like trying to secure section honey from a very large brood-chamber from whose combs the bees have consumed the most of the honey the winter previous. In this case the bees would begin to store honey largely at the beginning of the harvest in the empty comb still in the lower part of the hive, and there would be four chances out of five in favor of their continuing to do so till they had nearly crowded all brood-rearing from the hive, resulting in no section honey and a very small colony for winter. The extracting of honey works in the same way so far as the sections are concerned, but it gives a good colony for winter. Sometimes a colony will not work in sections by giving bees and partly filled sections as above; but there is one plan that I have never known to fail: In obstinate cases, get some drone brood and fit it into one or two of the sections, placing them in the center of the section cases; and if honey is coming in from the fields, and your colony is in a condition to work in boxes, you will see them start on either side of this brood at once. After the brood hatches, the bees will store the comb with honey, which will have to be sold as second quality; or you can extract the honey and throw the comb into the wax-extractor as you please.

G. M. DOOLITTLE.

Borodino, N. Y.

The results of my experiments in this line agree almost exactly with your own. Whenever we used to find a section of drone brood in it, instead of lamenting we used to regard it as a prize, because by means of it we could readily coax the bees up above, from almost any colony. In fact, I have by such means coaxed them above when they really had neither bees nor honey enough to warrant their going above at all. Perhaps reversing the combs, in connection with some sections that had been worked on, from some other hive, might answer. It certainly is of great importance that bees be induced to commence in the sections when

honey begins to come in. A little stubbornness at such a time may result in a big loss to the owner of the apiary.

BEE-DRESS.

W. L. COGGSHALL'S BEE-DRESS.

NOW much better it is to have things right, and how much pleasanter it is to use them, and how much more we can accomplish in a day! I know we are creatures of habit. We all have a way to do any particular thing, and always (so we think) a better way than any one else. If any of you who read this will suggest any improvement, it will be very thankfully received, and you will be recompensed for so doing.

My idea of a bee-veil is shown in the accompanying photograph. It is simply a wide-rimmed straw or leg-horn hat, with a stiff rim (I right here went and got my hat to give you measurements). The rim of the hat is 4 inches wide; the length of veil, up and down, 18 inches, and the material is bobinet or millinet, black. I sew the veil on the under side of the rim of the hat, 2 inches from the outer edge of the rim, thus giving a 2-inch projection to shade the veil, so that I can see at any time; for if the sun strikes the veil, I can not see eggs in the cells. I use a flat shoestring for a shir, or take-up, around the

neck, and have all of the gathering in the sides and back of the veil. I sew the veil fast to the string. The shoestring is long enough to tie under the collar, so it is impossible for a bee to get to your face. There is not much gathering in front to obstruct the vision.

When I am not in the bee-yard, or going from one apiary to another, I untie and tuck it in the crown of the hat, and it is out of the way, and all ready at a moment's notice, which we all know is very convenient sometimes.

For hand gear or false sleeves I use colored shirting. After they are made, dip them in linseed oil; hang them in the sun till dry, then the bees can not sting through them. I have a rubber elastic in the upper end above the elbow, also the one that is around the hand; have a thumb-hole worked in above the elastic, so that the hand is all covered, except the thumb and fingers (like a mit), only the fingers are all together. With sleeves made in that way, bees do not crawl up my arms and make me uncomfortable, and give me pain.

W. L. COGGSHALL.

West Groton, N. Y., April 21, 1889.

Now, friend C., although we are very much obliged indeed for the sketch you give

us above, we do not like it a bit because you did not say any thing about that broom. If I recollect right, you told me at Utica that you had a variety of soft broom corn, and that you made soft brooms for the sole purpose of brushing bees off from the combs; that you preferred them to the yucca brushes, the Davis bee-brush, or any thing else that had ever been brought out. You see our engraver has made the broom quite a prominent object. We also wanted to know something about that thing in your other hand. Is it a smoker, or what is it? Tell us about these two implements, with all the particulars, just as you have about the veil and the sleeves.

THE BUTCHER BIRD.

A HARD-HEARTED AND BLOOD-THIRSTY MEMBER OF THE FEATHERED TRIBES.

MR. JULIUS JOHANSEN, Port Clinton, Ohio, writes me in effect as follows:

I send you two black insects (crickets), which, as you will see, are impaled on the short sharp twigs. I took them from my quince-trees. There are many such imprisoned, or, rather, pinned to the tree. Some are dried up, though the two I send you were alive when I found them; and when I severed the twigs from the trees I supposed at first that their impalement was the result of accident; but as I find so many I conclude that some enemy (of the victims) has done this. I have watched closely to discover this jailer, but so far in vain. I think he must work at night, as early in the morning I find most of the fresh victims alive.

To-day I found the large insect (a dragon-fly) hanging to a quince twig. I thought him the one that sticks the others on the spines. As I caught him he dropped a yellow mass which I suppose was made up of eggs, as I find it on the impaled insects. Now, "kind friend," this is quite likely a law of nature that you are entirely familiar with; but it is a great mystery to me, and is doubtless the same to most readers of GLEANINGS; so will you explain the matter in that journal?

Again, are these insects in any way connected with the borers with which my quinces are badly infested?

Oh yes, friend J., I am well acquainted with this curious freak of nature. There is much humor—many jokes—often cruel ones like this of which you write—in nature. And it is this humor, together with the many strange methods by which nature does her work, that gives this study its rare and irresistible fascination.

The cruel persecutor in this case is the well-known butcher bird (*Collyrio borealis*). This bird is also known as the "great northern shrike." It is about the size of the robin, light blue in color, with black tail and wings, and a short black line from the bill through the eye to the base of the neck. It is white beneath. It is slim, strong, and, although a song bird, or percher, yet in its strong feet and hooked bill it reminds us of the birds of prey—the hawks and owls.

In habits this bird is a cruel joker. It catches insects, and even mice, frogs, and birds, and hangs them up on sharp twigs and thorns. Now, if this were simply a provident habit, saving up for times of scarcity, we could forgive his birdship—we certainly could if he would kill his victims before he hangs them up in this excruciating style. But in all my observation I have never seen him take and use any of his victims after they were impaled. It would seem a sort of fiendish sport, and we can hardly doubt but that this bird is a most fit subject

to report to Bergh, as worthy prosecution for cruelty to animals. Yet so long as we see horses, poor, lame, and starved, and yet forced to hard labor under the spur of the cruel lash, we must not berate these birds too severely. It is a very sad fact, that cruelty is not limited to the lower ranks of animal life. It is possible that the shrike may, upon occasion, take and feed upon his impaled victims; but he is so industrious that he can usually obtain enough fresh material for his mate and fledglings. In the rare cases when his hunts are fruitless he repairs to his thorn-bush larder—and so his young are still provided for.

The large dragon-fly found by Mr. J. had no relation to the impaled insects. The dropping from this insect was fecal, not eggs. The darning-needle lays its eggs in water, not in trees nor on other insects. The borers which infest Mr. J.'s quince-trees are in no way related to the insects sent. There are three kinds of beetles that bore or tunnel the quince. These can be kept off by the use of the soap and carbolic-acid mixture, as previously described.

A. J. COOK.

Agricultural College, Mich.

Friend Cook, your statement is, to me, astounding. Were it not as you say, that entomologists are agreed in this matter, I should stick to it pretty stubbornly that you had made a mistake. That a bird should take live animals, and impale them on sharp thorns simply for amusement, is something to me unheard of; and it appears from friend Johnson's statement that the vicious bird actually puts them on while they are alive, and leaves them squirming in agony—that is, if insects suffer as we do. Ernest suggests that the phenomenon may be something akin to the way cats play with mice before they kill them finally.

UNFINISHED SECTIONS.

GOOD REASONS WHY THEY SHOULD NOT BE USED.

MUCH has been written in GLEANINGS of late in favor of using sections filled with comb left over from the preceding season. Some of the writers have contented themselves with simple argument. Others speak from a knowledge born of indefinite experience, while some point triumphantly to two or three experiments which to their minds settle the whole thing. A question of this kind can never be settled by mere argument. Practical experience alone can decide, and I do not remember a single experiment quoted in favor of their use which was carried on in such a way as to be at all conclusive. To really prove any thing, an experiment must be made on a scale large enough to overcome individual variations and under varying conditions. It proves nothing to say that you put a case of unfinished sections on one hive and a case of new sections filled with foundation on another, and that the first case was filled sooner than the other, or that it looked just as well. I used one year about 500 sections filled with comb that were of an altogether different make from those filled with foundation. These partly finished sections were scattered all through the apiary, taking pains to have them impartially distributed, not only in every hive but in nearly every wide frame which I then used. On ac-

count of the difference in sections, every box of honey built on these combs could be distinguished wherever it was seen, from those built on foundation. The result showed that, on an average, the sections containing foundation were finished sooner than those containing comb, and were moreover much nicer in appearance. This experiment, I think it will be admitted, was fairly conclusive. Still, thinking that the variation of seasons might change results, I have tried substantially the same thing every season since, and always with the same results. I shall try it again this season, in the chance of learning something more on the subject, and I hope all who wish to learn for themselves, or are at all skeptical on this point, will do the same. Let every case of sections you prepare for the season's use contain a certain definite number of partly finished sections, placed in a certain part of the case. Compare these sections in their growth and completion with those in the corresponding part of the same case, and average the results. When you take the honey from the cases, put that stored in old combs by itself. If you can not make a distinction, before the honey is sold, between that in new and that in old combs, why, then your experience will be very different from that of mine. My experience has been each year, that it not only costs more to have honey stored in unfinished sections, but that the honey, when finished, is not worth as much. Nearly all such honey must be graded as No. 2, which with me brings usually two cents per pound less than No. 1. Of course, if all the cells must be lengthened out much, the outside is new comb, and will look well enough; but it is very seldom that a section filled with comb will make a really nice section of honey.

Some claim that it is a great advantage to have at least one or two sections of comb in every case at the beginning of the season, as "bait combs," to attract the bees into the supers. This may be of use at times, though I have seldom seen the need of it. However, for other reasons, I prefer to have the bees store their first honey in extracting-combs, so I have been in the habit of placing a shallow set of combs over each hive and removing it as soon as they were well at work in them. Not having enough of these cases to go around, I have this year made extracting-frames which interchange with the section-holders in a case like that of your Dovetailed hive. They are so made that combs cut from unfinished sections will fit in nicely, fastened with rosin and wax, or twine. One of these will be placed in each super. When filled, the honey will be extracted and the combs stored away by the superful ready for a sudden honey-flow; and as the end of the season approaches, they will be returned to the hives in such a way as to largely lessen the number of sections left unfinished. In this way I kill several birds with one stone.

Dayton, Ill., May 10, 1889.

J. A. GREEN.

I am very glad indeed that you have brought this matter up. It has seemed somewhat of late as if the whole thing were to be abandoned as a mistake; but I can not see how it is possible, when we had so many direct testimonies from practical honey-producers, at conventions held winter before last. I had supposed, however, that it was generally agreed that one or two sections, partly filled with comb from the year previous would certainly be an inducement

for the bees to make a start at the commencement of the season. Now, can we not have a good many experiments made during the coming season, and made exactly in the way you have mapped out.

HOW TO RAISE BUCKWHEAT.

BUCKWHEAT IN ILLINOIS.

EVER since keeping bees I have raised from 5 to 16 acres of buckwheat; and the amount per acre, as near as I can remember, has been 10 bushels. In this locality, which is the western part of Central Illinois, we want to sow about the 4th of July; if sown later, it is in danger of being cut off by the frost. I usually sow three pecks per acre, and get best crops from land plowed shallow in the spring, and then broken deeper just before sowing. About one year out of three it pays better than any other crop on the farm, and about one year out of five is a complete failure. When I get the largest crop of grain we usually get the largest amount of honey from the flowers.

For four years now, I have been sowing rye in the fall. Immediately after the crop is matured and taken off, I put the ground to buckwheat. I am not quite so certain of getting a good yield, but two crops a year of grain and one of honey will more than overbalance the difference in the yield. If I wait the thrashing of my other grain until buckwheat is ready, the other grain is liable to spoil in the stack. Sometimes I have thrashed the other grain when it was ready, and thrashed the buckwheat when it was ripe; but that necessitated getting up two sets of hands, which I found expensive; so, year before last I tried thrashing it with flails, myself and two hands, which I found much cheaper, but quite tedious, as it can not be flailed out unless very dry, which in a wet year might occasion quite a loss. Last year I bought the cylinder, and the frame on which it runs, of an old thrashing-machine (for a trifle), which I used as an old-fashioned chaff piler. I just threw the belt from my two-horse tread-power on to the pulley of the cylinder, and with it I could thrash as fast as a hand could pitch it on the table of the machine, which is the best arrangement I have found, and the most satisfactory. Of course, the buckwheat was not cleaned, but it could be stored in the barn, and cleaned some rainy day, or at a leisure time. I expect to raise none but the Japanese buckwheat this year, as I think it pays far better than the gray or silverhull. I have several times tried breaking my oat ground, and putting in buckwheat; but it usually gets caught by the frost, and so late flows do not seem to yield much honey. Some complain that buckwheat injures the ground, but I do not find it so; neither does it bother by coming up where I do not want it. I think this section of country is not so well adapted to buckwheat culture as is Pennsylvania and some other States further east.

L. C. AXTELL.

Roseville, Ill., Apr. 20, 1889.

BUCKWHEAT IN NEW YORK.

Buckwheat is a grain that possesses many features valuable to the farmer, of which many have failed to take advantage. It is a grain credited with the ability to grow on any soil, no matter how poor, and produce a paying crop. The fact is, there

is none of our grains that will better repay sowing on good soil. Buckwheat is very sensitive to climatic changes, and especially so to an east wind and hot burning sun during the time the grain is forming. An *extra* crop can not be raised if the climatic conditions are not favorable; but there has not been a complete failure of the crop in this section since I can remember.

Buckwheat should be sown on a loose mellow soil; and a clover sod turned under is the best. It should be sown while the ground is dry and dusty, and never immediately after a rain. I believe that I lost over 10 bushels per acre by sowing too soon after a rain. Roll the ground immediately after sowing, as the grain sprouts quick, and is sometimes out of the ground in less than four days.

The silverhull variety yields the best with me. When first introduced here a neighbor sowed half a bushel per acre on eight acres, and harvested 200 bushels. In 1887 I plowed under a year-old clover sod, and drilled six bushels on four acres. It came up very thick, grew tall and strong, smothering all weeds, and I harvested 160 bushels, 50 lbs. to the bushel. In this section the bulk of the crop is sown between June 15th and 25th. The fourth-of-July men have had frosted grain of late years. I have known of some fair crops that were sown in May.

Buckwheat should be cut with a self-rake reaper, and tied and set up by hand. Some use a self-binder here, but I have never seen one that did the work satisfactorily to me. Some never tie their buckwheat; but last year, owing to its standing up better, that which was tied was ready to thrash earlier, and brought 75 cts. per bushel, while much that was beaten down by rain brought later only 45 to 50.

Buckwheat being a fast grower, it requires a sufficient amount of plant-food near the surface. If the soil is deficient it can be supplied with commercial fertilizer. It must be remembered, that a sufficient amount of moisture must be present for a chemical fertilizer to help any crop. If this kind of fertilizer is used it should be drilled with the grain. I shall drill at the rate of 200 lbs. per acre on one field this year. Every one must be his own judge as to the amount required, but I would never use less than 100 lbs. per acre, of a standard brand. One rich in potash gives the best results with me. A large grower told me that, with chemical fertilizer, and depth of soil enough to cover the seed, he could raise a paying crop.

Buckwheat is mostly thrashed here now at the rate of three cents per bushel with the steam-thrasher, the farmer getting the grain to the machine, and furnishing coal for the engine. A small crop can be thrashed to advantage with the flail, or trodden out by horses, on the barn floor. It can be thrashed when drawing in the barn, or, if work is pressing, left until freezing weather. A neighbor thrashed over one acre last winter with his horses, rather than be to the trouble of getting a machine.

Buckwheat straw has a low feeding value, but it can be made to help out a ration by mixing with bran and oil-meal. It will be eaten readily by horses, cattle, and sheep, for a change. If not used for feed, it should be saved and used as an absorbent in stable and yard. The fattening properties of the grain are well known to most horse-jockeys; but the fat is of a soft nature. We fed a flock of lambs, for grain feed, a mixture of buckwheat and corn; and the result was satisfactory, both in wool and the gain in flesh. I believe it is worth one cent

per pound as a feed for sheep and poultry. We can buy the middlings at \$14 per ton, so the grain is sold and the middlings fed.

BUCKWHEAT AS A HONEY-PRODUCER.

I have said nothing about the honey-producing qualities of this plant, leaving it to the close-observing specialist to state how many pounds one acre will secrete. Buckwheat has never failed to give us a good yield of honey here, sometimes an average of 50 lbs. surplus comb per colony. Some years this comb honey has sold as low as six cents per pound.

Buckwheat has a use besides producing honey, grain, and straw. It will, if sown rather thick, subdue almost any of our common and troublesome weeds; and, if sown for a succession of years on the same piece, completely eradicate them. To raise a profitable crop of buckwheat, as well as any thing else, requires some brains as well as good soil.

CHAS. CHAPMAN.

Watkins, N. Y.

HINTS FROM ONE WHO HAS GROWN IT FOR 40 YEARS.

I have been growing buckwheat for forty years, on a small scale. I plow and drag the ground a month or more previous to seeding, which is, in our latitude, from the first to the middle of July. If the land is clean, sow the seed one heaping half-bushel per acre of the common varieties (I have not had sufficient experience in the Japanese to say how much seed per acre), cultivate it in, and thoroughly harrow. If it should be wet it won't matter whether the cultivating is done before or after. This cultivating is a new idea taken from an article of yours in GLEANINGS, on plowing in turnips. As buckwheat is sown about the same time, when the ground is usually dry and hot, I have no doubt but that is the way to do it. I put mine in that way last year, and I raised about three times as much per acre as my neighbors who harrowed in. The ground must be put in good condition, to insure a good crop. The time for sowing, no one can tell. It wants to be sown as late as possible, to escape frost.

NOT PAYING TO SOW EARLY.

My experience in sowing early for bees is that it doesn't pay. It is out of the proper season; blooms in the heat of summer; bees get but little out of it, and it doesn't make grain enough to pay expenses.

TO THRASH IT.

If the crop is small, lay boards on the ground; build a rail pen two or three feet high; cover over with rails; beat out with forks. I got my Japanese almost ruined last year in thrashing with a machine. It cracked the grains of the Japanese, but did not damage the other varieties. The most of the broken grains can be taken out with a sand-sieve, but I didn't find it out until I had nearly sold out.

R. ROBINSON.

Laclede, Fayette Co., Ill., May 6, 1889.

RAISING BUCKWHEAT IN TEXAS; THE OLD SETTLER AND THE LAWYER.

As GLEANINGS finds its way clear off into parts where some of the readers have never seen cotton grow, it may be equally interesting to them to know that it finds its way into parts where we have never seen buckwheat grow. I planted some a few weeks ago; and the other day, when I was busy with my hoe, weeding it out, an old settler (been in Texas 52 years) leaned over the fence and called out to me:

"Risien, what's the matter with your cotton? it's not getting off right somehow."

When I told him that it was buckwheat, he said it was the first he ever saw. You see that, when buckwheat first comes up—in fact, till it commences to bloom—it looks like cotton. This circumstance reminded me of two of our good citizens (one a lawyer and the other a merchant) who became enthusiastic about farming. Each one bought a large farm. The merchant planted him a little patch of buckwheat broadcast; so when it was up well, so as to attract the attention of the lawyer, "Well," says the lawyer, "you may as well give it up right now; who ever heard tell of planting *cotton broadcast*?" I am real glad that you have asked your readers for further information about it. I was just on the eve of suggesting it to you.

E. E. RISIEN.

San Saba, Tex., May 13, 1889.

TWO CROPS OF BUCKWHEAT IN A SEASON IN KANSAS.

I have raised several acres of nice buckwheat every year for my bees, for quite a number of years. I generally sow my seed about the first of May. By the 10th or 15th of July it is ripe. After it is cut and out of the way I cultivate and harrow the ground thoroughly, but do not sow any seed, for what is shelled out from the first crop will be plenty for seed. I have sown broadcast, and drilled in with a two-horse drill. I prefer the drill. As to harvesting, a self-rake machine is the best to cut it with. To cut with a mower, and rake it up, wastes too much. Last year I took my self-binder, left off the elevator canvases, and put on the bottom canvas; then I took out the roller that runs the lower elevator canvas; that let the buckwheat run off on the ground without elevating it. I had it in swaths six feet apart; that worked to perfection. If I had a small quantity I would thrash it out with a flail, fork, or a stick; if I had a large quantity I would have it thrashed with a machine. This year I shall put in 12 acres after the fall wheat is cut. I can not see any difference in yield here, between the first and second crop.

C. GEHRING.

Barnes, Washington Co., Kan., May 8, 1889.

BUCKWHEAT MORE FOR THE HONEY THAN SEED.

We scarcely ever sow a large crop of buckwheat, but we expect to sow a larger crop this season. We have been in the habit of sowing more for the honey than for the seed. We generally sow our seed the first of July, then the seed has ample time to get ripe before frost catches it. When the seed is ripe we cut it down and let it dry, then we drive along with a wagon that has a tight bed, and it is piled on the wagon, flailed out, and the straw is piled out on the field; it is then taken to a fan, cleaned, and put in bags or barrels. We have never had two crops of buckwheat in one season. This season our crop will be after the oats are cut.

Clermont, Ind., May 14, 1889.

T. TANSEL.

BUCKWHEAT IN PENNSYLVANIA.

I never raised 1000 bushels of buckwheat in one year. The most in one year was 402 bushels, machine measure, in 1887. Hundreds of bushels are raised around here. The most successful way with us is to plow the ground the last of May or first of June, and harrow it. From the 20th of June till the 6th of July we drill, using a little over $\frac{1}{2}$ bushel to the acre (it will take 3 pecks of Japanese), and from 75 to 150 lbs. of phosphate. Harrow the ground

again just before drilling, for buckwheat needs a good seed-bed, with plant food close to its roots. Phosphate shows more on buckwheat than any other grain. We cut with a reaper in the morning, or all day if cloudy. Sometimes we set up after the reaper, and sometimes leave it for two or three days. We set four rows of bunches together, to make it convenient to load. We thrash with a separator, using three teams to haul it to the machine. Two to four hands stay in the field to pitch it on the wagon, and one stays at the machine to help the driver pitch it to the machine. J. J. SHANOR.

Butler, Pa., April 24, 1889.

TWO CROPS IN A SEASON IN ALABAMA.

Two crops of Japanese buckwheat can easily be raised in one season by sowing the first early in the spring, as soon as all danger from frost is over. Early in the spring of 1887 I drilled about half an ounce of buckwheat, which yielded something over half a gallon of grain. This crop received one hoeing. A portion of this new grain was then sown about the first of July, and would have done well had the weeds not choked it out. This was in Northern Alabama.

The next year I sowed to "new ground" early, and by the 23d of May it was from 1 to 2 feet high, at which time it was literally cut to the ground by a severe hailstorm. As the plants were yet young and tender, many put forth suckers, which, with what survived, yielded well by oat harvest. A portion of this first crop was immediately sown to oat stubble, and yielded a handsome crop of well-matured grain before frost. This was in Northern Arkansas.

A. P. STAIR.

Wolf Bayou, Ark.

THE TIME TO SOW, DURING CHESTNUT-BLOOM IN NORTH CAROLINA.

We always sow our buckwheat when the chestnut-bloom is white, which in this latitude is commonly about the first of July, sometimes sooner and sometimes later. We have tried sowing in May, but with poor success. The hot June and July sun caused it to blast. By sowing during chestnut-bloom, the time of filling comes during the cool nights of August, and when bee-forage is scarce.

Dark Ridge, N. C., Apr., 1889. G. W. MCGUIRE.

RENDERING WAX WITH A PRESS.

THE ADVANTAGES OF THE PRESS, ETC.

PERHAPS you may remember I have always advocated the Cary wax-press as the best thing to get all the wax out of combs, especially if they are old. If any one has 100 lbs. of wax to render, the press will almost pay for itself on old combs; and for cappings and scraps of new comb it has the advantage of speed, as two hands can make from 200 to 300 lbs. in one day, while an extractor is crowded to make over 20 lbs. a day, with much fussing and annoyance to the women-folks. The press also has this advantage, that the wax is left in solid cakes, while the extracted wax must be caked after making, incurring another fussing job.

Last season I made my wax and some for my neighbors, on an improved press, which gave good satisfaction. I send you drawings, so you can give it to your readers if you like.

The manner of using it is an improvement on the

method described in the A B C of Bee Culture. There all the combs are to be melted in the press-tank, which makes it very slow. My method is to melt the combs in another vessel, in my case a large kettle, out of doors, and then dip the melted combs and all that rises to the top of the kettle into the forms, and press at once. This makes the work continuous; for by the time one pressful is run out, another is melted in the kettle. Three or four pailfuls of water are kept in the kettle all the time; and when this once gets hot, wax soon melts in it. So much for the manner of working.

HATCH'S IMPROVEMENT ON CARY'S WAX-PRESS.

The improvement in the press consists, 1, in dispensing with the tank entirely, a tray with a "lip" taking its place, being only two inches deep; 2, the rigid side-pieces to the frame are hinged at the bottom so as to turn to one side out of the way while filling the press—two eyes, united at the bottom, making the hinge. In using the press in cold windy weather, an outside shell of boards to slip down over the "cheese" before pressing would be a help, for cold winds might cause the wax to congeal before running into the molds. Eighteen inches square is a good size for the tray, and 15 x 15 for the "forms." The form is made of $\frac{3}{8}$ -inch stuff, 4 inches wide. The racks are made of three-cornered top-bars. The cloths are of burlaps, such as bran-sacks are made of. Wire nails, $1\frac{1}{2}$ inches long, are used to pin the cloth together when building the "cheese." The screw is a common iron bench-screw, such as can be had at any hardware store. Material to make a press should not cost over \$1.75, or \$2.00 at the outside. I am sure, if you would make one and use it on old combs, especially on scraps having much propolis among it, you would never want to "fuss" with a wax-extractor again.

Ithaca, Wis., Jan. 28, 1889.

C. A. HATCH.

I heartily agree with you, friend H. Your machine seems to be a model arrangement, especially the device for letting the screw fall over out of the way.

HONEY STATISTICS

FROM ALL PARTS OF THE UNITED STATES.

In order to read understandingly the reports given below, it will be necessary to observe the following points: First, the State is given; then next in their order are the names of the reporters, with their respective postoffices. To indicate locality, the usual abbreviations are used—N., S., E., and W., for north, south, east, and west; N. E. for north-east, etc. The letter C indicates the word "central;" E. C., east-central, etc. In the following list, the first figure represents the month, and the second figure the date at which the report was rendered. The small letters, a, b, c, d, etc., indicate the answers to the questions propounded in questions a, b, c, etc., just below

WE herewith present our first installment of statistics for 1889. You will notice that our correspondents are located in such a way as to cover the entire United States. The average date at which the statements are rendered is May 10. The questions to which they reply are as follows:

a. What per cent of your bees have wintered?

b. What per cent of the bees in your locality do you estimate have wintered?

c. What size of brood-frame is used most largely in your locality?

d. What frame do you prefer?

e. What per cent of an average crop of honey has been secured in your locality up to date, as nearly as you can estimate?

f. What are the prospects for a honey crop this year?

ALABAMA.

W. P. W. Duke, Nettieborough, S. W. 5-15.
a. 100; b. 85; c. L.; e. 80, taking 100 as standard for full crop. I did not lose a single colony in wintering.

J. M. Jenkins, Wetumpka. C. 5-20.
a. 95; b. 90; c. mostly none at all; d. Simp.; e. 100; f. good, good.

ARIZONA.

Jno. L. Gregg, Tempe, C. 5-8.
a. 98; b. 96; c. $1\frac{1}{2} \times 1\frac{1}{2}$ Gregg frame; d. I prefer this for the extractor; e. about 10; f. fine.

ARKANSAS.

W. H. Laws, Lavaca, W. C. 5-8.
a. 95; b. 95; c. Langstroth; d. L.; f. good. My 100 colonies contain less bees than ever before at this season of the year. Swarming has just begun; expect few swarms this season.

CALIFORNIA.

W. W. Bliss, Duarte, S. E. 5-11.
a. 95; b. 80; c. no standard size. Any and all sizes used, but we are rapidly changing to the L. and $\frac{3}{4}$ L. frame; d. $\frac{3}{4}$ L.; e. 20; f. very good.

Wm. Muth-Rasmussen, Independence. E. 5-10.
a. Probably 100. Not yet examined; b. probably 95; c. cross-wise L.; wide frames of same size, hold six sections; d. above; e. none; f. good.

R. Wilkin, San Buenaventura, S. W. 5-15.
a. 80; b. 85; c. L. universally; d. mostly; d. L. The form might be varied materially without loss only for the sake of uniformity in the community; e. 2; f. very good.

CONNECTICUT.

Lewis Sperry, Hartford. 5-6.
a. 100; b. have not heard of any losses; c. L.; d. L.; f. never knew it better. Bees are booming.

Daniel H. Johnson, Danielsonville. E. 5-6.
a. 83; b. 80 to 90; c. Langstroth; d. I use the L., but I sometimes think a shorter one would be better; f. Apparently good at this date.

R. M. Wilbur, New Milford. 5-15.
a. 80; b. 85 to 90; c. d. L.; f. very good indeed.

COLORADO.

Mark W. Moe, Denver. C. 5-9.
a. 100; b. probably 95 or more; c. d. L.; f. good.

FLORIDA.

J. L. Clark, Appalachicola. W. 5-13.
a. About 85; b. say 90; c. 1888; d. as above; e. full crop, extra quality.

John Y. Detwiler, New Smyrna. E. C. 5-6.
a. About 95; b. same; c. $9\frac{1}{2} \times 17\frac{1}{2}$; d. mostly; d. $11\frac{1}{2} \times 11\frac{1}{2}$ (Gallup every time; e. too early by 10 days to extract; f. present prospects fair for early or dark honey.

GORGIA.

J. P. H. Brown, Augusta. E. C. 5-17.
a. 90; b. 80; c. L. $17\frac{1}{2} \times 9\frac{1}{2}$; d. L.; e. a full average; f. fine.

Walter McWilliams, Griffin. W. C. 6-7.
a. 100; b. 80 to 90; c. L. (8 x 16 inches) and Simplicity; d. Simplicity for ever; e. 40, with splendid weather to secure the 60 per cent.

R. H. Campbell, Madison. C. 5-7.
a. 95; b. 90; c. L.; e. 100; f. good.

T. E. Hanbury, Atlanta. N. 5-7.
a. 100; b. 100; c. d. L.; e. 100.

IOWA.

Z. T. Hawk, Audubon. W. C. 5-6.
a. All; b. 95; c. L.; one apiary; Heddon; d. a frame $16\frac{1}{2}$ in. long, 7 in. deep, outside dimensions, with the Vandusen metal corners. It is a standing frame, fixed, and reversible; inside area, 100.4 sq. inches; f. excellent.

Eugene Secor, Forest City. N. 5-1.
a. 95; b. 90 to 95; c. d. L.; e. none; f. I see no reason for discouragement.

Oliver Foster, Mt. Vernon. E. 5-6.
a. All; b. 95; c. d. Simplicity L.; e. no honey yet; f. good.
J. W. Bittenbender, Knoxville. S. E. 5-10.
a. 99; b. 90; c. d. Heddon's; c. too early for this question; f. good.

J. M. Shuck, Des Moines. C. 5-7.
a. All; b. 99 at least; c. L.; d. my own, same size as L.; f. not good. Season well forward, but we need rain very much.

A. Christie, Smithland. W. 5-7.
a. 95; b. have recently returned from Colorado, and am not informed; c. d. L.; f. too early to say, but bees are in excellent condition.

INDIANA.

I. R. Good, Nappanee. N. W. 5-5.
a. 97; b. 80; c. $11\frac{1}{2} \times 9\frac{1}{2}$, and L.; d. new Heddon and L.; f. not very good. White clover is scarce, and we are having a drouth which is damaging what there is.

Mrs. A. F. Proper, Portland. E. C. 5-7.
a. All; b. 75; c. $11\frac{1}{2} \times 10\frac{1}{2}$ —adjustable and L.; d. adjustable; f. fair.

T. H. Kloer, Terre Haute. W. C. 5-8.
a. 95; b. from 95 to 100; c. L.; d. L. at present; e. none; f. We are now in the midst of a terrible spring drouth. Not a good rain all March and April. Winter has been rather dry. Nothing can grow. The white clover, which is more promising than I have seen it since 1883, is beginning to dry up. Unless we have rain very soon, there will be no white honey.

Joe. A. Burton, Mitchell. S. C. 5-9.
a. All; b. 95; c. d. L.; f. good if it would rain.

ILLINOIS.

Mrs. L. Harrison, Peoria. W. C. 5-9.
a. 97; b. 90; c. d. L.; e. no surplus; f. fair, but rain is greatly needed.

F. W. Goodrich, Bloomington. C. 5-10.
a. All; b. 90; c. $10\frac{1}{2} \times 12\frac{1}{2}$; d. crosswise L.; f. very poor.

C. Dadant, Hamilton. N. W. 5-9.
a. No loss; b. all; c. Quinby and Langstroth; d. Quinby; e. too early for answer; f. good for clover, if it doesn't get too dry.

C. C. Miller, Marengo. N. 5-4.
a. 99, but an unusual number of queenless colonies, so per haps only 90 are left; b. perhaps 90; c. d. L.; f. good, if rain comes.

Frank Howard, Fairfield. S. 5-8.
a. 100; b. 99; c. L., and a frame $12\frac{1}{2} \times 9\frac{1}{2}$; d. the latter; f. good.

KANSAS.

J. C. Stanley, Wichita. S. C. 5-5.
a. All; b. 98; c. d. L.; f. good.

J. B. Kline, Topeka. E. C. 5-6.
a. All; b. nearly all; c. Gallup, L.; d. Gallup; e. not any—too early; f. good so far.

KENTUCKY.

D. F. Savage, Hopkinsville. S. W. 5-8.
a. All; b. 90; c. d. L.; f. prospects very good.

Jno. S. Reese, Winchester. C. 5-5.
a. All; b. 25; c. d. L.; e. none; f. good—better than usual.

J. P. Moore, Morgan. N. 5-5.
a. All; b. 95; c. d. L.; f. fair. White clover is thicker than it has been for four years.

LOUISIANA.

J. W. K. Shaw, Loreauville. S. C. 5-9.
a. Starvation has reduced the colonies to $\frac{1}{2}$; b. $\frac{2}{3}$; c. L. frame, Root measure, and the American; d. the L. frame, always; e. a few colonies extracted to give room, in April and May last, gave 65 lbs. each; f. outlook is good.

MAINE.

S. H. Hutchinson, Mechanic Falls. 5-8.
a. b. About 80; c. d. L.; f. good.

J. Reynolds, Clinton. S. E. 5-6.
a. 97; b. 65; c. L.; d. don't know; use L.; f. good.

MASSACHUSETTS.

J. E. Pond, No. Attleboro. S. E. 5-13.
a. All; b. 75, I judge from advices; c. d. L.; e. too early to decide; f. prospects are good.

E. W. Lund, Baldwinville. N. C. 5-7.
a. 90; b. 90; c. can not tell all sizes used; d. $10\frac{1}{2} \times 13$; f. very good.

Wm. W. Cary, Colerain. N. W. 5-6.
a. 98; b. 95; c. about $\frac{1}{2}$ L.; rest, Cary-L., $10\frac{1}{2} \times 13$ inside; d. Cary-L. winter best, and breed up earliest; have about $\frac{1}{2}$ of each for years in my apiary; e. season not yet opened; f. good.

A. A. Sanborn, Westfield. C. 5-6.
a. 87; b. 90 to 95; c. d. L.; f. good.

MARYLAND.

Simon P. Roddy, Mechanicstown. 5-15.
a. 99; b. 95; c. $9\frac{1}{2} \times 15\frac{1}{2}$; d. the above size; f. good.

MICHIGAN.

A. J. Cook, Lansing. C. 5-5.
a. 95; b. 85; c. Gallup and L.; d. L.; e. none to speak of; f. good, I think.

H. D. Cutting, Clinton. S. E. 5-6.
a. 99; b. 80; c. $9\frac{1}{2} \times 13\frac{1}{2}$; inside; d. $10\frac{1}{2} \times 14$, outside, but I am using the L.

James Heddon, Dowagiac, S. W. 5-6.
a. 85; b. 85; c. L., 8½x17½; sold by Heddon; d. the close-fitting Heddon frame, 5x18; e. no surplus yet, and very small gathering for brood-chambers; too cold; f. only fair.

George E. Hilton, Fremont, W. 5-6.
a. 95; b. 95; c. d. L.; f. if we get the latter rains, good; too dry at present.

MINNESOTA.

N. P. Aspinwall, Harrison, C. 5-7.
a. b. All; c. American; d. American; no experience with any other; f. extra good.

D. P. Lister, Lac qui Parle, W. C. 5-7.
a. 95; b. 75; c. d. L.; f. so far, conditions of bees considered as well, I think it good.

W. L. Urie, Minneapolis, E. C. 5-7.
a. 98; b. 95; c. L., length of top bar, inside measure, 15½; deep, out, 10; inside, 9½. It is called Langstroth, but it is one inch deeper than the regular size of Langstroth; d. I prefer this size; f. I never saw it better than now, since I have been in the State; hive full of bees, and working rapidly on fruit-bloom.

J. H. Johnson, Fairmont, 5-16.
a. All; b. no complaints; wintered well; c. d. L.; f. fair.
A. F. Bright, Mazeppa, E. 5-7.
a. 96; b. about 90; c. d. L.; f. not very good; too dry.

MISSISSIPPI.

Oscar F. Bledsoe, Grenada, N. 5-12.
a. About 95; b. very near the same; c. d. short L.; e. fully 100 or over; more clover honey than I ever knew to date; f. excellent. I am becoming more confident each year in bee-culture, here in the South, as a paying pursuit.

MISSOURI.

S. E. Miller, Bluffton, E. C. 5-11.
a. 90; carelessness was the cause of loss; b. 90; c. L., or about the equivalent; d. do.; f. very good; have had a very dry spell, but are just now having a splendid rain.

Jno. Nebel & Son, High Hill, E. C. 5-6.
a. 98; b. 98; c. d. L.; f. good for white clover if it rains soon. At present it is very dry for the growth of vegetation.

Chas. L. Gough, Rock Spring, E. C. 5-11.
a. 100; b. about 60; c. none only what I have introduced. I use a frame 11½ wide, 16 deep, and one 11½x11½; have one L. hive; like it well; d. I prefer 11½x11½ for storing up, for extracted honey; e. extracted part of 4 stands May 10; got about 50 lbs.; f. good at present. Bees are booming on white clover; almost too dry at present writing; have one swarm; but no queen came out, and they went back.

James Parshall, Skidmore, N. W. 5-7.
a. 95; b. 95; c. d. L.; f. prospects are very promising.

NEBRASKA.

F. Kingsley, Hebron, S. C. 5-8.
a. b. 80; c. d. L. brood-frame; f. never better.
A. E. Maley, Auburn, 5-12.
a. 100; b. 90; c. d. L.; f. good.

J. W. Porter, Ponca, N. E. 5-6.
a. 98; b. 80; c. L., 17½x8½; d. L.; f. the prospects are favorable, but there is not as great difference in seasons in respect to honey crop south of us as is complained of in more eastern States.

NEVADA.

E. A. Moore, Reno, W. C. 5-10.
a. About 90; b. about 75; c. Use L. frame; all others, box hives; hard to tell size; f. good.

NEW HAMPSHIRE.

C. E. Watts, Rumney, C. 5-11.
a. About 84; b. nearly all; c. I have some L. frames and some 10x14, and there are some others used; d. all things considered, the L.; f. the prospect for a honey crop is good.

NEW JERSEY.

J. D. Coles, Woodstown, S. W. 5-10.
a. b. 75; c. old-fashioned box, 10x10x20; d. L.; f. good.
Watson Allen, Bernardsville, N. C. 5-8.
a. 93½; b. 85; c. d. 10x15; f. good for white clover.

NEW YORK.

P. H. Elwood, Starkville, C. 5-10.
a. 99; b. 95; c. L., 10½x16 inside; d. new quincy, Hetherington size, 10½x16; f. full average.

H. P. Langdon, East Constable, N. E. 5-7.
a. 90; b. 75; c. American, and but few of those; d. Root's Simplicity; f. first-class.

Frank Boomhower, Gallupville, E. C. 5-6.
a. 98; b. 90; c. about 10x15; d. L.; f. more than good.
G. M. Doolittle, Borodino, C. 5-6.
a. 98; b. 95; c. d. Gallup; f. fair.

NORTH CAROLINA.

Abott L. Swinson, Goldsboro, E. 5-8.
a. 95; b. 90; c. L., when any is used; d. L., e. ½; f. very good.

OHIO.

Dr. G. L. Tinker, New Philadelphia, N. E. 5-6.
a. 89; b. 85; c. the New York 7x17; d. 1x17; f. the prospect could not be better at this time.

Chas. F. Muth, Cincinnati, S. W. 5-7.
a. All; b. 75 or more; c. d. L.; e. none yet so far; f. most excellent.

Dr. H. Resse, Delaware, C. 5-9.
a. 60; b. about 60; c. d. L., f. first rate.
A. B. Mason, Auburndale, N. W. 5-4.
a. 100; b. 95; c. d. L.; f. good.

OREGON.

George Ehlers, Baker City, E. 5-9.
a. 20; b. 15; c. d. L., f. poor.
J. D. Rusk, Milwaukie, 5-11.
a. 90; b. 95; c. d. L.; f. good.

PENNSYLVANIA.

Thos. C. Davis, Idlewood, C. 5-8.
a. 90; b. about 90; c. d. L.; e. honey is coming in rapidly now; f. the prospects are excellent.

C. W. King, Emlenton, N. W. 5-7.
a. 99; b. 90; c. L.; d. 10½x14; f. good.
S. W. Morrison, Oxford, S. E. 5-6.
a. 100; b. 75; c. d. L.; e. 100, from cherry and apple blossom; f. very good.

Geo. A. Wright, Glenwood, N. E. 5-7.
a. 60; b. 90; c. L.; d. I'm stuck; f. fair. My out-apiary, worked for extracted honey, and wintered in Simplicity hives, is gone by the board; home apiary, worked for comb honey, and wintered in chaff hives, is in fine condition.

RHODE ISLAND.

Samuel Cushman, Pawtucket, 5-1.
a. 90; b. 60 to 70; c. L.; d. L. frame, Hoffman style; f. bees are doing well, and prospects for clover are good.

A. C. Miller, Providence, E. 5-6.
a. 75; b. 95; c. L.; d. L., after using 5 other kinds; f. unusually good.

SOUTH CAROLINA.

WYOMING TERRITORY.

G. G. Mead, Ferris. S. 5-17.
a. 75; b. no other bee keepers here; c. d. L.; f. good.

A summarized averaged statement for the entire United States, we find stands as follows:

a. Of the bees owned by the special reporters, 91½ per cent have wintered.

b. Of the bees in the localities of the reporters, 83¾ per cent have wintered.

c. 75 per cent of the localities reported are using the L. frame exclusively, and the others use odd sizes, no one frame in particular.

d. The frame used by the reporters themselves is about the same as stated in c.

e. Where honey has been coming in, a full average has been secured up to date.

f. The prospects throughout the United States are universally good—never better.

Now let us go back and see what the statistics mean. To question a we find the average of 91 per cent is considerably better than the average for about the same date for last year, the ratio standing 91 to 84; but remember this rather has reference to those who reported on *their own* bees. The percentage of loss for the *localities* (bee-keepers, good, bad, and indifferent), is also much less this year—the ratio standing 17 to 33 in favor of 1889. Observe that the reporters (who are in most instances the best and most successful bee-keepers we could select for the localities) have had much better success than the mediocre bee-keepers—those who can not afford to own a good text-book or take a good bee-journal. The first-mentioned class lost only 9 per cent; the last mentioned lost 17 per cent. This point was clearly brought out in the statistics for last year. The answers to question c prove conclusively that the Langstroth frame is the universal standard throughout the length and breadth of our country. There are three times as many L. frames, according to the reports, as *all the rest of the frames put together*, odd sizes included. If we eliminate the frames used by only one or at most two or three bee-keepers in certain localities, there would be probably ten times as many of the L. pattern as of any other. We were a little surprised that not more of the Gallup or the American frames are in use. We were surprised, also, to see that so few square frames are in use. The universal use of the L. frame, north as well as south, proves, if it proves any thing, that, all things considered, that is the best frame for the masses. It proves, also, that bees winter just as well in a shallow frame (like the L., for instance) as in a deep or square frame. If any one can see any *better* results in wintering, from those who report using the square or nearly square frame, we must say we have been either awfully careless in looking over the reports, or that our eyesight is pretty poor. If the square frame will winter bees better, the reports ought to show it; but they don't.

Perhaps we should say, that although the reports do not show it, yet many letters we are receiving say that the yield from fruit-bloom has been unusually large.

ON THE BANK OF THE MISSOURI.

SOME OF THE THINGS I MISSED DURING MY TRAVELS.

WE can hardly express in words the pleasure we have taken in reading your travels in California and the West. Our father has also been very much interested in said part of GLEANINGS. He does not read the part pertaining to bees, as he is not very much interested in them. We consider your very plain and interesting description of your travels worth many times the subscription price of GLEANINGS; and the illustrations are simply grand. Why, to read your writings and look at the illustrations makes one feel almost as if he had been with you and seen it all. We have also read with some amusement the complaints brought against you for passing by some of the bee keepers; but we did not know that we had any cause for complaint until reading your concluding remarks, where you refer to the Missouri River. We only then realized that you had passed within sight of our home; that is, we can see the cars in winter, as the Missouri Pacific R. R. runs within two and a half miles of this place, and we know that, if you had been looking north across the river, just after passing a small place called Morrison, you would have admired the beautiful bluffs within three-fourths of a mile east of here, even if you had seen scenery more grand during your travels. Your remarks about the Missouri River are very interesting to one acquainted with that grand old stream. Sure enough, it is like a meadow brook in the way of cutting away its banks. It is not an uncommon occurrence for it to cut in an eighty-acre farm, worth four or five thousand dollars, in a very short length of time. You are right, too, about the land being very fertile; and the islands you refer to are, many of them, or portions of them, cultivated, and produce fine crops while they also furnish splendid pasturage for cattle. Of course, they are overflowed some years, and those farming them lose their labor; but on an average it pays well to cultivate them. On these islands near here is where our bees get most of their early pollen, and this year we think they got some honey from the willows.

Now, friend Root, while we could hardly expect you to spend your time in calling on such little bee-keepers like ourselves (not big guns), we should have enjoyed a visit from you very much; and had we known when you passed here we should have been pleased to meet you at some station where your train stopped, even if only long enough to take you by the hand and exchange a few words. Now, when you start on your next trip, let your friends know beforehand what route you are going to take, so that they may be prepared to pick you up when you do not know just where to look for them. Bluffton is an inconvenient place to get to; but please remember, if you ever get as near here again as you have been, and think you can spare the time to stop off, we shall try hard to make things pleasant for you here, and assure you a hearty welcome in our father's old log house on the bank of the Missouri.

Bluffton, Mo., May 16, 1889. MILLER BROTHERS.

Dear friends, it is not the big guns only I love to visit. It is true, I like to see them, for, as a matter of course, they have many short cuts and improvements which you

could not expect to find among the small bee-keepers. But the most real enjoyment I have found in traveling has been, as a rule, in meeting the friends on small apiaries and in humble homes. I should enjoy extremely, making you a visit. I remember pretty nearly the locality you describe; and what you told me makes me still more enthusiastic in regard to this matter of restraining our great rivers. We do not want "prohibition" in this matter, but we do want to know how to "regulate and restrain." I feel satisfied, from what I could see from the car window, that valuable farms—yes, thousands upon thousands of acres—were going to waste because of our helplessness in this matter. Why, the very essence of fertility of our best farming lands is being continually carried away and spread over these immense flats, pushed one way and then another by the water, so it is of no value to any one. I should not be surprised if some of that bottom land were so rich in fertility that not even stable manure or chemical fertilizers would make it do any better.

SMALL, BLACK, SHINY ROBBER-BEES.

ARE THEY HONEY-BEES, OR A WILD BEE.

MR. E. H. CALLINGS, of the Hamilton Co., Indiana, Bee-keepers' Association, writes me that, at their recent meeting, several members reported serious robbing from small, black, shiny, almost hairless bees. He says they come in swarms to the victims of their greed, and seem to meet no resistance. They are doing very serious damage. Our society asks that you give us your opinion of these depredators in GLEANINGS, that it may be read before our society at its next meeting. Several have tried to hunt these marauders to their holes, in hopes to exterminate them. "We know that you are very busy, but society always presumes one like you can always find a *little* more time to do one more kindness."

These are not social but solitary bees, I presume of the genus *Andrena*. I have often heard like complaints, but never before has any such report as this come to my notice. Usually it is said that they are too few to do any serious damage. Now it is asserted that they come in swarms. I think it is easy to explain this. The past warm winter has been very favorable to insect-life, so that such insects or bees, instead of dying off by the thousands, as is usually the case, nearly all live through. I have noticed that wild bees are unusually abundant on fruit-bloom this spring.

These bees are solitary, and make their cells either in hollow stems or else in earthen tunnels. Thus to hunt these foragers to their holes would be like seeking needles in a straw-stack. Like our common honey-bees, these wild bees rob—at least so I think—only when there is no nectar in the flowers. Thus, I presume in Indiana they are stealing just after the prosperous season of the fruit-bloom. Bees are very much like men—they find it hard to brook a famine after prosperity has smiled upon them for a season, and so they often take to larceny. It is very difficult to suggest a cure for this evil. The bees are small, and can not be stopp'd out except as we close the bees in. Again, for

some strange reason the bees seem to bear their enemies no ill will, but almost welcome these bee-tramps; so we can hardly shut them out by nearly closing the entrance. As these *Andrenæ* pilfer only when the harvest is past, in case they are too serious it may pay to close the hives; and if the weather is not too warm, let the hives remain on their stands, else carry them to the cellar. There is a silver lining to this unwelcome cloud; and that is, it soon blows over. So far as I know, these raids are soon past. Either the robbers are smitten with compunctions of conscience, or else, and more likely, they find fresh nectar in the flowers, where to rob is to do a kindness.

I am sorry Mr. Callings did not send me some of the bees, then I could know just what they were.

Agricultural College, Mich.

A. J. COOK.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

SUGAR VS. NATURAL STORES; COMPARATIVE EXPERIMENTS ON, AND THE RELATIVE COST OF EACH.

FRIEND ROCT:—I send you the result of an experiment which I tried, to ascertain the comparative value of honey and sugar syrup as winter feed for bees.

I gave two hives empty frames, and weighed them; then I fed each 27 lbs. of syrup, made in the proportion of 2 of best granulated sugar to one of water. As soon as they had the syrup stored in the combs they were again weighed. On the same day, Oct. 22, two other hives having all natural stores, and, to all appearances, of the same strength as the first two, were weighed. They were all weighed Nov. 16, and again April 27th, when fruit-bloom had just opened, and this is the record:

We will call the sugar-fed hives A and B, and the hives having natural stores C and D. Oct. 18, A and B having empty combs, each weighed 40 lbs.; C and D 58 and 62½ lbs. respectively. Oct. 22, after A and B had their feed stored in the combs, they weighed 62 and 61 lbs. respectively; the former having lost 6 and the latter 5 lbs. in storing. Nov. 16, A weighed 56 lbs. and B 56½, while C weighed 55 and D 58½ lbs. Thus, between Oct. 18 and Nov. 16, A lost 11 lbs., B 10½, C 3, and D 4. April 27, A weighed 42½ lbs., B 40, C 37, and D 42. Thus, for the whole time, A lost 24½ lbs., B 27, C 21, and D 20½.

Although my experiment was upon too small a scale to furnish a very reliable rule, so far as it goes it shows that 25 lbs. of syrup, made in the proportion of 2 of sugar to one of water, is equal to 20 of honey. With sugar at 9 cts., the present price, and honey at 7½, the value of the 25 lbs. of syrup would be just equal to the 20 lbs. of honey; and unless bees winter better on syrup than they do on honey, the labor of extracting honey and making and feeding the syrup would be just so much time and labor wasted.

J. MCNEIL.

Hudson, N. Y., May 6, 1889.

Friend M., I don't think your experiment is as conclusive as you seem to put it. A colony that has a certain number of pounds of stores sealed up in their combs, all ready for winter, is in better condition—that is,

they will survive longer on this quantity of stores, than if this sealed honey were unsealed stores; at least, that is my opinion after having done considerable taking away the honey and giving sugar stores instead. Now, I do not mean to say that natural stores will go further than sugar, but, on the contrary, if the colony has stores of sugar syrup sealed up in good shape for winter, it would answer just as well or even better than the natural stores. The point is, that it costs a good deal to get any kind of stores, well ripened and sealed, up in the combs. In working some little time to get a colony of vicious hybrids to accept a different queen, they uncapped their honey and gorged themselves with it, and then put it back in their combs so many times that they nearly used up in a couple of weeks what would otherwise have lasted them all winter.

IS IT TRUE?

I inclose a clipping from the *New York Evening Post*, which I thought might be of interest to you.

YOUNG G. LEE.

Charlotte Harbor, Fla., May 13, 1889.

CURIOUS DISCOVERY OF OLD HONEY.

A remarkable discovery has just been made at the Cathays Yard of the Taff Vale Railway Company. A large elm-tree, grown in Gloucestershire, was being cut up into timber, when, right in the very heart, a cavity measuring 8 feet by 7½ inches in diameter was discovered almost completely filled with a comb of the honey-bee, together with a squirrel's skull. No means of access to the hollow was discoverable, neither was decay anywhere apparent, and around the cavity itself no less than fifty "rings," each ring denoting a year's growth, were counted, the outer bark, too, being without a flaw. The hollow was of uniform size throughout, and presented the appearance of having been bored with an auger, and, great though its dimensions were, it was practically filled with the comb, proving that the bees must have been in possession for several years. Empty combs of the queen-bee also showed that they had swarmed. How the bees got there can only be guessed, but it is surmised that a squirrel once occupied a decayed hole in the tree, cleared away the decay, occupied the cavity as its home, and there died. Then the bees entered into possession and filled the hole with comb, when by some means the entrance, which must have been small, became stopped, the large quantity of grub and fly being taken as demonstrative that the nest was not voluntarily deserted. Then for fifty years the growth of the timber went on. The entrance being absolutely obliterated and the hole being hermetically sealed, the comb was preserved from decay for half a century, to be found at last in the way described. The find is of the greatest interest to naturalists. *Pall Mall Gazette*.

There is nothing particularly new in the above. I believe that wood-choppers meet with many such cases, although the trees may not be as large and as old as the one mentioned above. The fact that they found brood in these old combs does not by any means indicate that the bees were stopped in. Where they starve out in the spring, there is almost always more or less brood left in the combs.

CHUNK HONEY, AND HOW IT SELLS.

I don't like sections. They are too much trouble, and too uncertain about getting filled. I like frames best for comb honey. I cut out what will do to eat, then extract the rest, after which I set the frames over a nucleus and let the bees clean them up. I now fill in with foundation the place

where I took out the honey. This is the way we have been managing ours the last three years when we had honey. We put in buckets and jars, and then pour in extracted honey. It sells before cool weather, and it goes off nicely this way. I think earthen jars the best yet to store honey in. We can weigh the jar, and then put the weight on a piece of paper, paste it on the jar, and then weigh honey and all together, and then wax a cloth and put it over the jar, tie it on with a string, and it will not leak or spill.

I like GLEANINGS well, Our Homes especially. Mr. and Mrs. Chaddock do look funny trying to get into a bee-hive at the side. Why not go in at the top? How are the carp getting along? I have not heard from them for some time. A. R. DIOK.

Hettick, Ia., Feb. 8, 1889.

The plan you give is old and well known; but there are people, and I presume there are communities, that would pay more for honey in a stone crock than for that stored in any other way. In fact, it has been suggested that honey tastes better when taken from an earthen jar than when stored in glass, tin, or any thing else. I should think the jars would be cumbersome to lug around.

The carp are getting along nicely, except that we are still troubled with brook minnows getting in among them. I suppose that, if I had some competent person to take charge of the carp-pond, just as we have Ernest and Mr. Spafford to take charge of the bees, then I could succeed in banishing the minnows from our pond. The only harm they do is to destroy the largest part of the eggs that the carp lay, and fill the pond with their own worthless selves.

IS ALSIKE A CROSS OF WHITE DUTCH?

As there was considerable discussion in GLEANINGS some time back concerning alsike clover, as to whether it was a cross between the red and white, I have proved to my satisfaction that it is. About five years ago I sowed some seed I got of A. I. Root. The second year, it bloomed out as nice alsike as I ever saw; the third year was dry, and it did not do much. The next year there was not a head of alsike to be seen—it was every bit white Dutch, and I know there had never been a seed of white clover on the ground. Year before last I sent to W. M. Plant, St. Louis, and got a peck of alsike and sowed it. Last year it was as fine alsike as I ever saw. This spring it has all bloomed out white Dutch—not a stalk of alsike, and there never was a bunch of white clover on the ground before last spring. I sowed five acres more alsike, and it has bloomed out as fine a set of white Dutch as I ever saw. I think that should be evidence enough; at least, I am satisfied with it. There is but one chance left for it to prove to be genuine alsike, and that is this: I pastured each piece, that I had sown to alsike, all winter and till in the spring. What have you got to say about it, friend Root?

CHAS. L. GOUGH.

Rock Spring, Mo., May 14, 1889.

The able professors of the Michigan Agricultural College, if I am not mistaken, declare that alsike is not a hybrid. If the seed you sowed contained no white clover at all, the phenomenon you mention is a mystery,

especially if, as you say, white clover does not grow just as thick on other plats where no alsike was sown. Alsike does not hold its place on any soil as the white clover does—at least, so far as my information extends; but I can not understand how alsike should by any possibility change to white-clover. I do not think that pasturing would affect the result either way. Will Prof. Cook please give us his opinion on this matter?

WINTERING SUCCESSFULLY IN A REPOSITORY REEKING WITH MOISTURE.

I built a cave, on Doolittle's plan, during October, 1888, except the shingle roof. I had none, and the walls of the cave were clay only. I had three doors to said cave, but no ventilation whatever. I put 7 colonies in the same, Nov. 6; and although the moisture was very dense indeed, they wintered splendidly, being in the cave only 135 days. My first swarm issued on the 7th inst., a fine large one too. I think cellar wintering can be made a *success*, even in a clay bank. We have a fine prospect for a good honey harvest for this season. White clover is very abundant indeed. C. W. VANHOUTEN.

Smithfield, Ill., May 10, 1889.

S. F. NEWMAN ON CELLAR VERSUS CHAFF WINTERING.

Ernest did not quite understand me when we were talking about different methods of wintering. If I were going to winter inside I would adopt friend Boardman's method of "no bottoms," but I do not prefer inside wintering by any means. My bees never winter as well inside as they do in your chaff hive. I have 50 colonies that are strong enough to swarm to-day, and would swarm if I had not right along given them combs in the upper story. If I ever get time I will write you what I think about the "winter problem," and of my experience and success in reference to it.

Norwalk, O., May 15, 1889.

S. F. NEWMAN.

Thanks, friend Newman. I accept the correction.

HOW MUCH HONEY WILL ONE ACRE OF CLOVER PRODUCE?

Somewhere in your writing you say one acre of clover will support ten colonies of bees. Will you please be kind enough to state, if one acre of clover is properly grown, and one colony of bees, properly managed, forages solely upon it, how much surplus honey ought this one acre of clover to produce?

SUBSCRIBER.

I do not remember the statement you mention. If I made it, I think I must have said "probably," for it is a very hard matter to determine how many colonies an acre of clover will keep busily employed. If we could get out on a desert, and keep our clover field going by irrigation, then we might get at it. I have very little idea how much honey an acre of clover might produce; but I will hazard a guess, that it might give 10 pounds of honey a day for, say, 10 or 15 days; perhaps it might give half that quantity for 10 or 15 days more. If any of the friends who have considered this matter feel like criticising my answer, I should be glad.

UNCAPPING-CANS; ARE THEY NECESSARY?

I have bought about 50 stands of bees this spring. I am thinking of running about that number for extracted honey, three miles from home. I should

like to have some of the friends tell, through GLEANINGS (if they can in time for this summer's crop of honey), how they manage the cappings—what they catch them in, and what is the best way to get the honey out of them, without buying an expensive uncapping-can like Dadant's? Or is that the cheapest, all things considered?

GRAPEVINES, CARE OF.

How will grapevines do in the apiary when the ground is set to white clover or blue grass, if the ground is kept dug up 12 to 18 inches around the vines, leaving the vines 6 feet apart each way? Or should the ground be mulched all over?

Bedford, Ia., May 6, 1889.

J. S. WILLARD.

An uncapping-can is by no means necessary. It is only a convenience. If you do not wish to go to too much expense, you might set a cheap metal strainer on top of a dish-pan or large pail—just such an arrangement, in fact, as we sell for our cheap wax-extractor.—Grapevines will do very well as you suggest. They should have a distance apart of eight feet or more, instead of only six. The grass and weeds should be cut away from around the vines for as much as two feet. Mulching will answer every purpose.

FRIEND BOARDMAN EXPLAINS A LITTLE MORE UPON HIS METHOD OF CONTRACTION.

Friend Ernest:—Perhaps I ought to make a little explanation in regard to my method of contraction of the brood-chamber during the honey-flow.

Putting new swarms, whether natural or artificial, on empty frames, constitutes a very perfect and natural mode of contraction, and is usually all that I desire for a period of 20 to 25 days, where the queen is able to pretty nearly keep pace with the comb-building; but if the comb is built considerably faster than the queen can fill it with eggs, I sometimes cut it back to about the capacity of the queen to fill, and use the pieces, thus cut out, in sections instead of foundation. I cut it back only in new colonies, never in the old ones. My new colonies on the old stand give me all the surplus. I see in the account of your "Rambles" you leave this a little indefinite.

Thanks. My memory was not quite clear upon this point, and so I did not dare to enlarge upon it very much. Your explanation makes it more satisfactory.—Friend Boardman replies further:

TWO QUEENS IN ONE COLONY.

I have made this season what is to me quite an important discovery. Of what real practical value it may prove, I am yet not quite ready to decide. It is, using two queens in one colony, keeping both in active operation for an indefinite time. I have several such colonies that have been running under this dual administration since the beginning of the season (6 or 8 weeks). I do not know yet how long it will continue. I think, until swarming time.

H. R. BOARDMAN.

East Townsend, O., May 7, 1889.

I suppose your discovery is, that bees will, a good many times, tolerate two queens at the same time. Under some circumstances, I know that this can be done; but at other times it does not seem to work at all. In fact, a good many of us have had expensive experience in trying to introduce queens where there was one already in the hive.

A queen pretty well along in years will almost always tolerate one of her daughters, and both lay right along together. Aside from this, we have not found it much of a success.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all questions, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

FROM 88 TO 150, AND 4500 LBS. OF HONEY.

LAST spring I commenced with 88 colonies, about 10 queenless. I built them, up but it took all the season. I increased to 150 colonies; ran 100 for extracted honey and 50 for comb honey. Extracted, I got 4200 lbs.; and from the 50, 300 lbs. I sold the extracted at an average of about 8½ cts. per lb.; the comb at about 11. Cash expenses, about \$15.00. I went into winter with 150 colonies; came out with 149, none queenless. I wintered in single-walled hives, out of doors. I sold some; will commence with 138 this year.

R. ROBINSON.

Laclede, Ill., May 6, 1889.

My son-in-law raised 170 lbs. of Japanese buckwheat from 2 lbs. bought of you last spring. We think it very good.

E. B. GLAZIER.

Dryden, N. Y.

ABSCONDING WITHOUT CLUSTERING.

I can put in my evidence, that two swarms from this neighborhood went direct from their hive entrances last summer, for the woods. W. N. ROOT.

Assumption, Ill., May 6, 1889.

DRONES FROM DRONE-LAYING QUEENS.

1. Are drones from a drone-laying queen capable of fertilization? 2. If so, are they as good as drones from a fertile queen?

ANDREWS & LOCKHART.

Pattens Mills, N. Y.

[1. Yes. 2. We think not.]

ONE BUSHEL FROM SEVEN OUNCES OF JAPANESE SEED.

I purchased seven ounces of Japanese buckwheat last season from you, and sowed it and got one bushel of fine buckwheat from it. I think that is pretty good. My bees seem to work on it almost constantly while in bloom, and it seems to be adapted to this country.

J. S. TURNER.

Formoso, Kan., May 15, 1889.

BOARDMAN'S REPOSITORY.

I am quite interested in Boardman's repository. I have been pulling the bottom of my hives all off every year. I have become convinced that the common entrance is not large enough, for the bees become clogged, and damage the colony. He hasn't said how high from the ground the first row of hives is; nor how he ventilates the first row. My colonies are reduced down to about 110 this year.

Portville, N. Y.

F. ROULO.

ORANGE-BLOSSOM HONEY.

Referring to page 323 of GLEANINGS, I find: "Orange-blossom honey, the first extracted honey of the season," which was taken March 21st. While visiting Prof. Webster, of Lake Helen, Fla., I assisted in extracting honey three days previous; viz., March 18, which was the second extraction.

The sources were orange-blossom and andromeda. The crop in that locality is half harvested. In the mangrove district, honey is coming in slowly, barely sufficient for brood-rearing. Grape and bay will be open in a few days. Bees are in good condition.

New Smyrna, Fla.

J. Y. DETWILER.

A SUGGESTION ON THE DOVETAILED HIVE.

You can get rid of the strips of tin you nail under the bottom of the super for the section-holders to rest on in Dovetailed hive, by making the end pieces of the honey-board wide enough for the holders to rest on.

W. P. DAVIS.

Hyatt, N. C., May 10, 1889.

[Your plan is very good, so far as it goes; but what are you going to do when you tier up? You would have to use a honey-board between every super, and that would be too expensive. See?]

WHY ARE THE DRONES CARRIED OUT?

Two of my best Italian colonies are dragging out drones at a rapid rate, full grown and immature ones. I want those drones to mate with my youngest queens. They have much sealed honey from last season. They have done this since April 20. What is the matter?

E. A. BOON.

Shellyville, Ill., May 6, 1889.

[I can not tell what it was, unless it was bad weather that discouraged them from swarming. Feeding regularly every day, I think, would have saved your drones.]

WILL BASSWOOD GROW IN SOUTH CAROLINA?

I should like to know if basswood would grow well in this climate. By referring to the map you can see where I am.

G. D. MIME.

Parksville, S. C., May 9, 1889.

[Yes, sir, basswood will grow everywhere; in fact, I never heard of a place yet where such trees would not grow, if they were planted. It is true, of course, that they grow naturally in certain localities and do not in others. In our locality we find them on the tops of the highest hills and in the lowest valleys; and I believe that wherever we have sent little basswoods they have succeeded when once started.]

BLUEBIRDS AND MARTINS EATING BEES.

Will bluebirds eat bees? Yesterday I saw one catching something, and to all appearances it was bees. I shot him, and his gizzard was full; there was nothing but bees. Then I shot a bee-martin, and he was full of bees also. My bees are doing very well at present. I look for swarms soon.

Dundee, Mo., May 10, 1889.

B. F. BAILEY.

[It has been urged that these birds simply catch drones and not workers. Did you examine the contents of their crops, to be sure on this point? My impression is, however, that it was workers that they caught, and that it was the honey in the honey-sacs that the birds coveted.]

W. S. DEVOL, FORMERLY OF THE OHIO EXPERIMENT STATION, NOW FIELD SUPERINTENDENT OF THE NEVADA AGRICULTURAL STATION.

I came to this station April 2, to take charge of the field work, agricultural and horticultural, and plenty to do in organizing the work. The field is new, and I have no doubt but much valuable work can be done here. The abundance of sage brush (*Artemisia tridentata*) makes excellent bee-pasture, and there is talk of conducting some experiments in bee culture.

W. S. DEVOL.

Reno, Nevada, May 10, 1889.

[We are very sorry indeed to have you leave Ohio; but if we must spare you, I am glad to see you where you are. I should be pleased to hear of some of the results of the experiments in regard to sage brush for honey.]

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 127.—How can prime swarming be prevented?

I know of no perfect preventive.

MRS. L. HARRISON.

I don't know of any positive cure.

PAUL L. VIALLO.

I don't know. I wish I did. Young queens or none at all, with shade and plenty of room, are powerful aids.

A. B. MASON.

By giving the workers the necessary room to deposit honey when flowers yield, and to the queen the necessary combs to deposit eggs. C. F. MUTH.

1. By extracting; 2. By keeping the colony weak by removing brood; 3. By giving plenty of room for storing and breeding. Not always sure.

A. J. COOK.

I do not know of any practical satisfactory way. Keeping a colony weakened down, or enlarging the hive excessively, will almost entirely prevent it.

R. WILKIN.

By taking out the queen with one or two brood-combs and attendant bees. Eight days after, break out all the queen-cells. A week or so after, the queen may be returned.

P. H. ELWOOD.

Cage the queen and remove all the queen-cells once in 10 days. Don't keep the queen caged over 20 days, as the colony will begin to run down as soon as the brood is all hatched out. E. FRANCE.

By using large hives, supplied with surplus boxes as soon as the crop begins, and provided with combs, you can prevent all swarming, save when bees replace their queens during honey crops.

DADANT & SON.

Prime swarming can not be entirely prevented by any practical means that I know of; but it may be greatly lessened by a free use of the extractor, in connection with large roomy hives. During the last few seasons I was in Iowa, less than 3 per cent of my colonies cast swarms.

O. O. POPPLETON.

Usually by giving the hive proper shade and ventilation, furnishing abundant room for the bees to store honey, and removing all queen-cells. Young queens are less inclined to swarm than old ones. Some cage the queen during the swarming season, and keep all queen-cells removed.

L. C. ROOT.

By the interference of man to such an extent that it throws the colony out of its normal condition. This can be done in many ways; but according to my opinion, none of these ways are conducive to the highest success of either the bees or their keeper, where comb honey is the object sought.

G. M. DOOLITTLE.

By giving such an abundance of empty combs that neither queen nor bees are ever crowded for room to store honey or lay eggs. Close extracting, even without so much room, will usually, though not always, prevent swarming. In general, swarming is discouraged by large hives and an abundance of ventilation and shade.

JAMES A. GREEN.

It has cost me many a dollar to prosecute this inquiry, and several times I have thought I had the answer just within reach, but first I knew it was off in the dim distance, and I must confess it is there yet. Of course, you know the stereotyped "plenty of room, shade, ventilation," etc., but with any or all of these they may still swarm. C. C. MILLER.

The man who can answer this question, by giving a plan that is successful in all cases, had better not answer until he has got his patent, as there is a fortune in it. I don't know any such plan. The tendency to swarm can be checked by tiering up before the lower sections are quite ready to seal, and constantly providing ample room, yet not too much. To entirely prevent swarming is about as hard as to keep a family of grown-up boys together in this country. It can't always be done. GEO. GRIMM.

There are too many ways to positively prevent swarming, and second swarming, for that matter, to dilate upon them in this department; but to answer your question practically, I believe there has never been up to this time any practical method devised which it pays to put in operation to prevent bees from swarming in a large, working apiary. In such cases when we have all the increase we desire, it is best to use the well-known practical methods to discourage swarming, and at the same time be with the apiary during the swarming hours and save what swarms break over the general rule and swarm. In the large apiary, other work demands our presence any way. For smaller apiaries, two or three long articles might be written upon the subject of how to manage them and not stay and watch swarms at all. Last summer I ran 60 colonies in one apiary in that way, and lost but one or two swarms, I believe.

JAMES HEDDON.

Now, here is a chance for some one to write a book upon this subject, and not answer all of the questions we could think of either. Several books have already been written, and a long array of articles to the bee-journals, away back through the past years, and yet the question seems to remain unanswered. I have found but one successful way to prevent swarming. This is my way: At a time when honey is coming in, shake or drum the bees out upon empty frames, on the old stand, and follow the new swarm with the surplus if any is on. When I have treated a whole apiary thus, I can trust them without any one to watch them. If you desire no increase, unite them with the parent colony after the season is over. Remove the old queens, and you have requened your whole apiary with young queens, without hardly thinking of it. I suspect the complete success of this plan depends something on the kind of hive used. Now, then, if this answer does not give satisfaction, and some one has a more successful way, I should like to hear from him.

H. R. BOARDMAN.

How can young people be prevented from trying to set up a new domicile? The thing is a little past the art of man. Some strains of bees are much less inclined to swarm than others. Some localities are very much less provocative of swarming than others. Running for extracted honey instead of for comb helps quite a bit. So if this man gets his stock from a business apiary where swarming seldom occurs, and keeps them in the right kind of a location, and runs for extracted honey, it is not likely that he will be troubled by swarming much.

As to location I will give my best judgment. Where the honey-flows are large, and mostly confined to a few short harvests, and the supplies of pollen rather scanty, there will be the least swarming of all. Where the honey-flows are small, and well spread over the whole season, and the supplies of pollen boundless, there will be the most swarming of all. This last pretty well describes my own location. I never had a colony get five pounds in one day that I know of; but I have had a third, if not a fourth, series of swarms led by the same queen in one season; and I have had thirty swarms in August. On the principle that any man can manage a bad wife except the poor wretch who has her, I suppose some of our respondents will tell us just how to do it.

E. E. HASTY.

I am glad to see, friends, with what unanimity you all refuse to recognize the claims of certain patent-right men for non-swarming hives. Even the traditional garret, where the bees have a whole room for it, does not prove, through a series of years, to be non-swarming.

QUESTION 128.—*How can second swarming be prevented?*

Leave but one queen-cell to hatch. E. FRANCE.

By cutting out the queen cells at the proper time.

MRS. L. HARRISON.

Remove all the queen-cells and introduce a laying queen.

L. C. ROOT.

By breaking out all the queen cells but one or (better) two adjoining ones.

C. F. MUTH.

Destroy all queen-cells, leaving only one, unless there is a young queen just hatched.

P. L. VIALLO.

I have had too little experience with either first or second swarms to know much about either.

O. O. POPPLETON.

By putting the swarm in the place of the hive which has swarmed, and putting the old hive elsewhere.

DADANT & SON.

Destroy all queen-cells but one, at the proper time after the first swarm has issued, say 6 to 10 days after.

GEO. GRIMM.

By removing all queen-cells but one, or all and giving new queens; also, usually by depleting the hive, *a la* Heddon. I find this works well.

A. J. COOK.

Usually by moving the old hive to a new location and placing the swarm on the old stand. By the Heddon plan. By cutting out all queen-cells but one.

C. C. MILLER.

By removing all but one of the queen-cells in one way. Moving the hive from which a swarm has issued, to a new location, will generally prevent after-swarming.

A. B. MASON.

By exhausting them of bees, which may be removed to the prime or first swarm, and employed in gathering surplus instead of acting as nurses in raising young bees that will never be able to pay for their board.

H. R. BOARDMAN.

1. A fertile queen may be given them; 2. After destroying all queen-cells a virgin queen may be given them; 3. All but one cell may be removed to a new location after a week. There are exceptions to all rules; and these are reliable, about in the order stated.

P. H. ELWOOD.

The best method I know any thing about, I devised and placed before the public, under the head of "Prevention of After-Swarms." It is printed in my book, and quoted and approved by Professor Cook, I believe, as well as being published in back numbers of bee-journals.

JAMES HEDDON.

I have always had good success by letting a newly hatched queen run in at the entrance as soon as possible after the first swarm issues. This method has the advantage of allowing you to select your breeding stock, and is very little trouble. What is known as the Heddon plan works well.

JAMES A. GREEN.

The following is the plan that I have laid out for myself the coming season: Set the prime swarm beside the parent hive; if too many bees incline to enter either of them, turn the entrance of the populous one away from the old position sufficient to prevent it. Six days after hiving, remove the parent hive to a new locality in the apiary, so that its surplus bees will return to the old stand, thus weakening it just at the time it would be getting the swarming fever again.

R. WILKIN.

Upon the issuing of the prime swarm, take the brood-combs from the parent hive, placing them in a box, substituting other frames in their place, hiving the swarm by the returning plan. Now carry the combs of brood and the adhering bees to a hive on a new stand, wherever you wish a colony to stand, placing the frames in this hive. On the morrow, take a virgin queen; and after lifting one of the frames from the hive, wait a moment, when the bees that are on it will begin to fill themselves with honey, as they are all young bees. You are now to put the mouth of the cage having the virgin queen in it near some cells of unsealed honey, from which she will quickly begin to eat. In doing this, both bees and queen assume a natural condition, when the frame is lowered into the hive, and the hive closed. If you look the next day you will find all queen-cells destroyed, and swarming given up.

G. M. DOOLITTLE.

I can tell how to do this, for I've done it—and contrived the plan all myself too. I listened at the hives at eventide, heard the young queens piping, rose early next morn, shook the bees into a swarming-basket, imprisoned them for two days in a pit, then returned them to the hive. It worked beautifully, and likewise ruined more than half the colonies I tried it on. Now, if I had waited an hour or two until the bees had swarmed naturally, and then had proceeded in the same manner for the rest of the process, it would have been all right. At least, that is my regular way of doing, and I have treated multitudes of them so with rarely any trouble. I concluded that breaking up their natural way infuriated them so that they killed their queen while waiting in the pit, and then (having got their hand in) they killed the other queen when returned to the hive. It was a time of great dearth of honey, and bees were abnormally cross. I mean to try the plan again under more favorable circumstances, and see if it can not be made to work. A lady, who has a considerable apiary next west of mine, handles all her second swarms by spreading them on a white sheet, and making them fly home after she has taken their queens all away. I'm sure I should miss half the queens (after-swarms frequently having several), and then they would go to the woods

instead of going home; but she seems to make a success of it. Shaking the bees in with the prime swarm every day or two is highly recommended. I have not tried it. It looks to me just like provoking the colonies from which your surplus must come, into a new series of swarms, and incurring at the same time a risk of making them queenless. In general, the man who says he can control the swarming fever never had a case of it on his hands—that's the long and the short of it. A dozen or even twenty prime swarms coming out in one hour is not swarm-fever. The colonies were all in good condition, and a freak of the weather brought them out all at once, that's all. A troublesome plenty of after-swarms, if they come in regular time (nine days after the first) is not exactly the disease either. In swarm-fever, swarms come out 14, 15, 16, and 17 days after the primes, showing that, in the first instance, the swarm came out with no preparation whatever. Young primes which have not yet built their quarters nearly full of comb begin a new series of swarms. Dividing is worse than useless. Each fragment sends out swarms; and the total of swarms is increased, and you have the division colonies in addition. This is the disease we invite you to cure, brethren; and hence these tears.

E. E. HASTY.

Removing all the queen-cells but one seems to be pretty generally accepted; but I should like to know how many of those who quote the above for an answer practice it regularly. I prefer the plan given by friend Green. But this does not always work. I expected friend Hasty was going to recommend burying the bees in the ground until they behaved themselves, as a remedy for all swarming troubles; but it seems that even the underground treatment does not always answer.

QUESTION 123—*I have a colony which has a young queen at liberty, and several more in their cells; and if left undisturbed it will send out a swarm to-morrow. If to-day I liberate all the queens from their cells, leaving two or more at large in the hive, but no queen in a cell, will the swarm issue?*

As the Spaniard says, "No sé." R. WILKIN.

Not as a rule; but they should be watched.

L. C. ROOT.

Not generally. They will kill each other, and one will remain.

P. L. VIALON.

I am inclined to think they will not, but I have no positive knowledge.

C. C. MILLER.

Probably not; there will be a battle, and the victor will likely hold the field. MRS. L. HARRISON.

Sometimes, but not as a general rule. I once had a swarm under precisely these conditions.

G. M. DOOLITTLE.

We think that bees will manage to keep two queens, and swarm with one and sometimes with both.

DADANT & SON.

Perhaps not, and yet it would not surprise me at all if they swarmed immediately, if it was a very favorable time for swarming. H. R. BOARDMAN.

I have never tried the experiment, so I can not say; but I wish the querist would do so and report; that is, report after trying the experiment several times, as once doing so will prove nothing.

Q. O. POPPLETON.

It is very uncertain just what they would do; but if I did not want them to swarm, I would take the queens away in place of liberating them.

E. FRANCE.

I don't know; but I think if that is the only condition existing that might be considered favorable to swarming, the swarm would not issue.

A. B. MASON.

It may issue at any time, and it may not. If the latter is the case, then all but one of the young queens have disappeared a few days afterward.

CHAS. F. MUTH.

I never tried this; but I think if the swarming-fever were prevalent among the bees they would swarm anyhow. There would be no certainty about it.

JAMES A. GREEN.

Yes, as a rule, supposing that in your climate or locality it is swarming time, and conditions for such are favorable; otherwise the surplus of queens will be killed off.

JAMES HEDDON.

Not today, Feb. 12. I don't know what they would do at the swarming season, but I think they would swarm the same. With the swarming-fever aroused they will swarm out with one young queen.

P. H. ELWOOD.

I think usually it would. Indeed, I have known several queens to come out of cells, hours before the swarm issued. The young queens do not always wait for the swarm to start before they issue from the cells.

A. J. COOK.

If the colony is strong, and honey-flow and weather fair, yes; if the colony is weak, then no. If the colony is strong, the bees will not allow all the young queens to meet any more than they would allow the hatched queen to destroy those in the cells, for the reason, I take it, that they desire to swarm—another illustration that the impulse to swarm comes from the bees.

GEO. GRIMM.

This scheme is interesting enough to deserve trial, both in moderately swarming and immoderately swarming apiaries. I will venture the opinion, that in the former it will usually succeed, while in the latter the swarm will often issue and leave a little queenless remnant in the old hive. Likewise I should not be surprised to see the whole batch turn up queenless sometimes. This plan seems to have one of the objections to the old cutting-out-all-but-one method (which is generally abandoned I believe); namely, serious liability to overlook one.

E. E. HASTY.

If I understand the above question, the point is, Does it change matters particularly one way or the other, if you open the cells with the point of your knife, or let them hatch after their own fashion? From what experience I have had with this kind of work, I should say that it would not make much difference. If the queens were let out of their cells before they were ready, the bees would probably tumble them out of their hives as so much rubbish—that is, if they noticed them at all. If they let them remain, when they have accumulated strength by taking sufficient honey and exercise they would swarm or not swarm, according to the flow of honey, number of bees, state of weather, etc. I once took a swarm of hybrids out of a bee-tree that seemed to have queens scattered all through the colo-

ny. They swarmed some, and I divided them up some, to give each queen a comb of brood. I think that none of the queens in this case meddle with each other at all; but perhaps the shock of the falling tree, and the bumping and tumbling around which they received might have put them out of fighting trim.

OUR HOMES.

Not to be ministered unto, but to minister.—MARK 10: 45.

WHAT TO DO, AND HOW TO BE HAPPY WHILE DOING IT.

ALTHOUGH the book is finished, the matter is not out of my mind, by any means, and very likely never will be. During this present spring of 1889 we have had some new experiences; and in many lines, at least this matter of raising crops seems to be really overdone. Friend Terry's potato-book has not had any thing near the sale that it had a year ago, and very likely the book has been the means of contributing at least somewhat to the great quantity of potatoes that can not be sold. I believe that this state of affairs prevails pretty much all over the United States. In our locality, thousands of bushels are being fed to stock, and may be other thousands will go the compost-heap. It has been suggested that reclaiming our swamps, planting potatoes by machinery, applying Paris green by machinery, harvesting the crop by machinery, etc., has made it impossible for planting, hoeing, and digging by hand, to pay expenses any longer. While I do not believe that this is true, there may be a grain of truth in it. The question is, Will potatoes ever again be worth a dollar a bushel? I think they will, but it may be a good while, and very likely prices are going to run lower. Now the same is to a great extent true, at least in many localities, with the apple crop; and while I write, there seems to be a great prospect that the coming strawberry crop will be beyond any thing heretofore known, and may be beyond what the people can consume. Should a frost, however, occur just now, and I confess that, on this 21st day of May, there is quite a prospect of it, such an event would change the aspect of things entirely. Then those who were prepared to defend their crops from the frost would probably make their money, while their less fortunate neighbors would lose heavily.

Well, a good many are taking the ground that it is impossible for our people to find employment, even raising crops, and that too many crops are raised already. While I do not believe this, I am afraid, as I said before, there is a grain of truth in it; and if your old friend had better stop urging everybody to raise crops and live under their own vine and fig-tree, is there any other opening? Has the great Father in heaven made a *blunder* in putting so many people in this world of ours, without providing any thing for them to do? Not so; and I am sure the fault is with ourselves and not with God. In the first place, it is by no

means certain that we should be any better off by getting a dollar a bushel for our potatoes, instead of 25 cents, or 15 cents for our strawberries, instead of 8 or 10 cents. You may say that we *must* have enough for our potatoes to pay the expense of cultivation and harvesting, and the same with strawberries. We must have enough for them to pay the cost of picking. In one sense this is true. But the escape from this apparent corner is in using more brains—in letting necessity be the mother of invention. Better plans must be invented for doing our work. We must shake off the sleepy way of doing things, and use the common sense and reason which God has given us; and this brings me to my subject of what to do. The waste and useless motions which are to be found in most employments in life are truly appalling. Two great strong men are often employed to do the work that one small boy could do easily. We have machinery and improved methods; but without brains to guide and direct them, they are, to a great extent, a failure. Men and women are wanted to guide and direct; to look after the leaks; to cure us of our stupidity. Stupidity is the word exactly. We are all stupid, even the best of us. At one time a great shopful of machinery was standing still, because the feed-pump to the boiler would not work. It was pulled to pieces, and put together again repeatedly. Every thing was all right. The matter was getting to be serious. The great crowd of hands could not go to work until the pump could be made to throw water into the boiler. What do you suppose the trouble was? The valve situated near the dome of the boiler was not open wide enough to let the steam into the pump. The *small* valve close to the pump was opened and closed repeatedly, of course; but somebody, in a shiftless sort of way, had opened the valve near the dome *only a little*, and there it stayed until some one of the crowd was keen enough to declare that the pump had not sufficient steam to do its work. The reply was, "Why, the valve is wide open;" but the man who was using his *brains* declared, "Then some *other* valve is not wide open, or there is some obstruction." Half a dozen ought to have guessed from the working of the machine where the trouble was.

A few days ago we were disappointed in not getting a washer-woman. Mrs. R. said that she and the children could do it if somebody would turn the wringer; and then she added that she thought the wringer would have to be thrown away and a new one bought, because it had got into a fashion of turning so hard lately. I decided to take a look at the wringer, and what do you suppose I found? First, the set-screw that pressed the rolls together was so rusty that I could not turn it with my thumb and finger. A five-cent oil-can and five cents' worth of sewing-machine oil fixed it nicely. Five cents paid for the oil in the can, and almost a bottleful besides; but when the screw was oiled I found it would not bring the rolls together so as to do good work.

"Oh!" replied my wife, "they *used* to

work together nicely, but lately we can not get them down so as to wring any thing as dry as it should be."

Before she had done speaking, however, I found that the blocks that moved the bearings of the rolls closer together touched each other at their ends, so that the screw, instead of crowding the rolls toward each other, simply crowded the two blocks of wood against each other; and had the weight of a ton been put on them it would not have affected the distance of the rolls a particle. I pulled the blocks out in a twinkling, and shaved off the ends; then the rolls came down together as they did when new. Next, in attempting to turn the crank, the uprights that support the rolls "waggled" back and forth one way and then the other. The wringer is one of those mounted on a bench, on two uprights. The bench is large enough to hold a tub on each side of the wringer. Well, these two uprights had been "wagging" for I don't know how long, in just that way. When I expressed my disgust at such a performance, my wife replied again, "Oh! that is the way it has been for this long time, and I have been pounding the wedges in at the bottom with all my might, but it does not do any good at all, or not much good."

I smiled as I drove the wedges clear out and showed her that the uprights did not nearly fill the mortise in the top of the machine. Instead of having been driven in snug, as the manufacturer ought to have made them, there is nearly a quarter of an inch play; but by keying the wedges up tight the uprights had an appearance of being firm. Perhaps they were firm for a little while when the machine was new.

"Well," said my wife, "what are you going to do about it? The holes were made too large in the first place, and they can not be made any smaller."

Right within reach stood a basket of strips of wood. They were remnants of frame stuff from the factory. With one hand I selected a piece of wood that just filled the vacancy in the mortise. Then I called for a saw to cut it off with, at the point where it was just thick enough. My wife has a nice little saw for home use. I found, however, that it was so dull it would hardly cut off a pine stick; secondly, it "waggled" in the handle just as the standards "waggled" in the wringer. I looked my disgust again, and she explained:

"Well, the nice, neat, sharp little saw you gave me was borrowed by one of the men when they were at work near the house. As they did not bring it back, I sent for it, and this thing came instead."

Now, my friends, you have a picture of some of the stupidity of the world I have been trying to tell you about. Somebody in a hurry borrowed the nice little saw, because it would save time in going to the factory, which was all well enough had he been conscientious enough, kind enough, or gentlemanly enough, perhaps I might say, to have handed *my wife's* saw back to her. He did not do it, and nobody knows where the saw is. Then somebody else, equally stupid (I hope I am not getting to be un-

duly uncharitable here), gave her this miserable tool to use in her work. Any workman—in fact, I should say any man or woman—ought to be ashamed of having such a dull thing to work with. We have a man in our establishment, employed on purpose to keep saws in order. In fact, he does nothing else; but yet day after day I find valuable, high-priced hands using dull, crooked saws, loose in the handle. All that was wanted to make the saw tight in the handle was to tighten up three or four screws. Possibly a *wedge* was needed also, to make a substantial job of it.

To return to the wringer: I selected my wedges so that the tenon required considerable driving before it would come down to the shoulder; and when down, the uprights were so rigid that it seemed as if the keys below were not needed. However, I made these keys draw just right, and then drove them all they would bear, without breaking the wood. By the way, it is quite a trade to learn just how much driving wood and metals will bear; and this can be learned only by experience. Those uprights will probably never loosen or move again; and in all the repairing I did, I tried to remedy the defects made in manufacturing in the first place. The wringer will probably work for years, no mishaps occurring, such as I have mentioned.

Now, while the world is full of people wanting something to do, waiting for somebody to set them at work, there is only one in a hundred—no, perhaps not more than one in a thousand—who has gumption or energy enough (it occurs to me again that I am using pretty strong language; but, dear friends, I do hope it does not apply to you) to see that the tools he works with are in shape to do *their best*. There are individuals, I know, who like nice tools, and those who won't go to work until their tools are in good trim; but they are few and far between. In fact, there is such a tremendous want for such people that they almost always get above—that is not just the expression I mean, but it tells the story—using tools of any kind. They get a reputation of doing every thing thoroughly and well, and at the same time expeditiously, by using good sound common sense at whatever they may apply their hands to, and pretty soon they get great wages. A relative was stopping with us a few weeks ago, who gets \$3500 a year. I questioned him some as to why he could command such pay. It is just in the line I have been telling you; and one other thing comes in with it. He said ever since he commenced selling goods he has made it a point to tell the purchaser every thing about the make of the goods that was to be known. He thoroughly posts himself in regard to the use of the article, the method of manufacture, and then he is so strictly honest that no one who ever deals with him ever has reason to suspect him of even "keeping dark." He sometimes sells single firms \$5000 worth of goods. Now, then, friends, you have something of a key to this problem, "What shall we do?" I think I can tell a great many of you what to do. Go and turn your wife's wringer; see if the

poor woman is wasting strength—wearing herself out, perhaps, and laying the foundation of future doctor bills. Get her such a saw as I have described, and then file it yourself or else see that it is kept sharp. If the boys dull it, teach them how to put it in order again, and *insist* on their doing it. Have a good screwdriver and wrench, and, above all things, an oil-can, or, better still, oil-cans of different sizes, and some good oil. If a door squeaks, or opens hard, fix it. Don't you get oil on the carpet, either, nor on anything else. If the spring in the door-lock is broken, fix it yourself, or hunt up a man to fix it. By the way, how many men do you know of in your vicinity who will fix a door-lock, and do it well the first time? How many men do you know of who would fix up a clothes-wringer in the way I have described, and do it right? Men who can do these things, or who have taught themselves to do them, are never without employment.

"Shall we all turn tinkers?" say you. Yes, my friend, turn tinker by all means, if you have nothing to do. He that is faithful in few things shall be made ruler over greater things. These are the Savior's words. "Not to be ministered unto, but to minister." These are also the words of the Master. How much experience have you had in employing workmen to fix things, and then find them no better than they were before—sometimes not as good. I know without your telling me. A great many times a piece of work is sent home without even testing it to see whether it will work or not. When you want a lock repaired, of course you send along the key. Well, there are people who will repair a lock and send it home without even taking the trouble to put the key in the lock to see if it will turn the bolt. They are too shiftless to test their work before sending it home. They have not been schooled or drilled in thoroughness. People who are professing Christians, it seems to me, can not love their neighbor even a little (let alone loving their neighbors as themselves), or they would consider how much vexation of spirit it makes him to send him something that can not be used. Perhaps some of you think I had better look at home. O friends, I do know it. God knows I know it. A foundation-mill was once sent across the ocean; but when the friend over there across the seas attempted to put the crank on the shaft, it would not go on. The hole in the crank was too small. He accused us of fraud, saying that the mill had never been tested, because the crank would not go on, and never had been on. He was a little uncharitable, however. As it soils a new crank in testing it in the wax-room, we have one soiled crank that is used to test all the mills; but the man who bored the hole in the crank was too shiftless to see whether the hole was large enough for the shaft or not; and the one who packed the mill up to send it off to a foreign country did not have love enough in his heart to prompt him to try the crank on the shaft, to see that it was all right. In our own household, in other households, on the street, out in the fields, and everywhere I

go, I hear this longing, "Oh for somebody who would be careful to do things right; who would return borrowed tools, and—borrowed umbrellas; for somebody who would be constantly thinking of the comforts and needs and rights of the neighbors around him, instead of simply self—getting out of the rain, perhaps; getting a cultivator long enough to do his own garden—not caring whether the tools he borrowed were returned or not!" It has been said, that, should the Savior come on earth now, he would find a great improvement over the time when he did come. I grant, dear friends, that he would find much improvement in intelligence, in the progress of invention, etc.; but, oh what a wide field he would find for the exercise of Christian spirit and love! Not to be ministered unto, but to minister.

It is not only that you will thus do good and make people happy, but you will accumulate money. When in California I told you of the great call for something to do—people out of employment; but yet our skillful *bee-men* are constantly wanted. Well, most of these bee-men are experts in repairing things. They can fix almost any piece of machinery. People came to them, and offered them big pay because they were skillful; and, my friend, if you are skillful, people will come to you and offer you big pay. You may say that your talent does not lie in that direction. I want to contradict you. You *can* be skillful if you *want to*, and nothing in this world will help you to be skillful like having the love of Christ Jesus in your heart. If it gives you pain to see a friend or neighbor work with a poor and inefficient implement, a loving desire for his welfare will prompt you to study into the whys and wherefores of things—to get acquainted with implements and machinery, and with the ordinary affairs of this busy world. You can "learn to fix things," by practice. Just keep at it during all your idle moments, and you will soon get to be a proficient. You may think it a small thing to use a *hammer* with skill. Why, a good mechanic with a nice hammer that just suits him will do four times the amount of nailing in an hour that an ordinary person does. A great many times I say, "Friend, will you just let me get hold of that hammer?" and oftentimes I will just make him laugh while I show him the tricks and turns, and the amount that can be accomplished by the skillful use of a hammer. And it is the same with almost all other tools. When I first commenced business, the inspiring motive was not love for Christ Jesus; it was simply love for a nice little woman about 18 years old, who lived off in the country, across the river. That was not a very bad incentive, I admit; but if it had been Christ Jesus, it might have included the other. Her father feared I would never "make a living." Said I (I guess it must have been one moonlight night while we stood by the gate), "*We will see.*" So when I opened a jeweler's repair shop I solicited repairing of all kinds. I fixed door-locks, umbrellas, parasols, coffee-mills, etc. If somebody suggested they had

better perhaps throw it away and buy a new one, "Oh no!" said I, "don't throw it away. I will fix it, and it shall not cost you very much." If there was nothing else to do, I would work a couple of hours at an old coffee-mill, and charge only *five cents*. I charged only five cents, because I did not think the article was of enough value to warrant *more* than five cents' charges. I was bound to build up business, and most of you know I did it. And you too, my friends, no matter where you are, nor how you are situated—I do not care if you are lame or blind or deaf, or even if you are sick, you can be helpful to those about you, and begin the apprenticeship in that great trade of helping others. "Not to be ministered unto, but to minister." Let that be the motto of your life, and Christ Jesus will see that you are well paid. Yes, "Good measure, pressed down, shaken together, running over." Now go and look after your wife's clothes-wringer this minute, lest all the above talk simply go in one ear and out of the other, without having accomplished any thing.

RECENT DEVELOPMENTS

CONDUCTED BY ERNEST R. ROOT.

THE NEW COMBINED CRATE.

I HAVE never liked the combined crate; but as we have sold a good many, it shows there is a demand for something of the kind. As the objectionable features could be easily removed, we have lately made the crate so that it can be manipulated in very much the same way as the T super. Mention has already been made on page 373, GLEANINGS for May 1, of the changes made in the combined crate; but on account of the lack of engravings, no detailed description was given.

OUR NEW COMBINED CRATE.

The engraving above represents the crate as we now manufacture it. In appearance it represents the old one very closely. The only difference noticeable is the removal, or, rather, absence, of the projecting shoulder at the bottom edge of each end. In the old crate this shoulder was put on for the purpose of filling up the space left open by the rabbets. The design was, of course, to prevent the bees from passing up and around the crate; but as most practical apiarists use their surplus crates in connection with a honey-board, the projecting shoulder, when so used, was an unnecessary feature; and, more than that, it prevented tiering up inside of Simplicity bodies. In this connection the feature of non-tiering up in the old crate was a very objectionable one.

The engraving above needs almost no explanation. It is simply a shallow box, the sides of which are so made as to receive a strip of glass. The sections, instead of resting upon T tins as in the T super, are supported by slats having insets corresponding to the sections and in number equal to the number of rows of sections. These slats rest upon a strip of tin nailed to the bottom inside edge of each end, projecting far enough inside to catch the slats. That there are objections to supporting-slats which correspond with the bottom of the sections, I am aware. It is true, they will not always match with the bottoms of the sections, either because of a slight displacement or because of unequal shrinkage. There are a great many, however, who seem to prefer such a method of support in place of T tins.

REMOVING SECTIONS FROM THE NEW COMBINED CRATE, EN MASSE.

By the engraving you will see that the combined crate can be emptied of its sections in the same way as the T super; the slats simply resting upon the strips of tin are movable, and, like the T tins, are to be removed with the sections *en masse*. While the new crate retains many of the advantages of the T super, it has some additional ones. As explained on page 373, it may be used with or without a honey-board, though we would recommend that it be used in connection with a honey-board. In the engraving in the opposite column it will be seen that the bee-space is put above the sections. Of course, when the honey-board is used, the bee-space should be above rather than below. If the honey-board is not used, the bee-space should be put below the sections. This is accomplished by putting a little $\frac{1}{4}$ -inch strip of wood between the strips of tin that support the slats, and the slats themselves. In all the combined crates we send out, we always send $\frac{1}{4}$ -inch strips of wood, so that the purchaser may suit his own fancy about his bee-space.

Another important feature that the crate has, is that open-side sections can be used in it, which can not be said of the T super. Besides this, it will hold the sections a little more nearly square. One-piece sections are inclined to be a little diamond-shaped, and with T tins this trouble is not materially improved, unless another set of tins are used above the sections. Now, we called the crate "combined" because it can be used both for a shipping package and as a surplus arrangement while on the hive. Although we do not exactly recommend shipping honey in the same crate in which it was produced on the hive, yet there are a great many farmers and others who prefer

to market their honey in that way. If it is desired, the slats can be removed, and thin boards be substituted in their place. These boards should be of the length and width of the inside dimensions, of the crate. Remove the sections *en masse* and let the bottom-board down in the crate when it will rest upon the tin supports. Insert the sections, and afterward cover the whole with a similar board. The bee-space on top will leave ample room for the cover-board.

Although the crate is made much more valuable to the apiarist, we make no extra charge. The price for the combined crate will be the same as formerly.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

FIGHTING INSECT ENEMIES.

THIS matter is at present occupying the attention not only of the experiment stations, but of intelligent and progressive people generally. Our valued magazine, *Popular Gardening*, devotes several pages to the matter; but I have felt a little surprised that almost all of them seem to give but little space to protection by means of arrangements for fencing the insects away. Of course, this remedy can be applied only to small plants like melons, cucumbers, vines, etc. It is true, some of them hint that boxes with mosquito-netting tacked over the top will do; but it seems to me that mosquito-netting is altogether too frail; besides, the *Medina* bugs have learned the trick of crawling through it. Nothing answers with us like the wire-cloth protectors which we devised last year, as mentioned in our seed catalogue. Granting that Paris green, pyrethrum, slugshot, or things of this sort will kill the striped melon-bug, you have got to apply it as soon as the first plant is up. On our grounds, the striped bug actually digs into the dirt to meet our choice melons as they begin to push through the soil; and very often the first leaves are eaten off before they are expanded; and now to kill them with chemicals or poison you have got to apply it as each leaf comes out; whereas the wire-cloth bug protector can be put on before the plants are up if you choose, and it makes a dead sure thing of the whole business until the plants are big enough to raise the covering so as to stand over them like an umbrella. On our grounds we use altogether three or four hundred of them. The sight of the bright green fresh plants, with their first leaves without scar or blemish, is to me a real cause of rejoicing. We have frequently put the wire covering over a part of the hills and left some of the vines uncovered. The result is, that the first real warm day we have, those outside of the inclosure are eaten up in a few hours; and where a leaf stretches up so as to touch the wire covering, a cluster of bugs station themselves on the wire cloth and gnaw the leaf as fast as it grows. I do like to have appliances that are sure and absolute, even if they cost some money. I notice that the *Rural New-Yorker*

speaks of the flea beetle again at work on their potato-vines; and they say that, although they have tried every thing so far, they are without a remedy that amounts to any thing. This accords much with my experience, with the exception of the remedy I have already given—lime and guano sifted together and raked into the soil before the seeds are planted. With this protection we raise cabbages, radishes, and every thing in that line, with perfect immunity; but our radishes in the open fields are this year an utter failure. If the tops do manage to struggle past their merciless foes, the roots, when pulled, are found to be so full of worm-holes they are of no account whatever. This satisfies me that it is the larva of the striped beetle that produces the club-root in cabbages and spoils our radishes. A good dose of lime in the soil remedies the club-root in cabbages; but at present it does not seem to save the radishes, or at least it does not save them where the lime was put on last fall. Fresh lime and fresh guano, when the seed is sown, does the business—at least it does in our plant-garden close to the building. It may be that lime, to be effective, must be applied freshly slacked, just as the seeds are sown. These flea-beetles have damaged our early cabbages in the fields very much. Paris green and London purple do not seem to hurt them a particle. Buhach troubles them some, but it is too expensive. We can not afford to dose all outdoors with a powder that costs 75 cents a pound. Slugshot does not seem to trouble them a particle. The kerosene emulsion hinders them some; but the trouble meets us that I have mentioned before—it has got to be applied as often as the new leaves come out. I have been hoping, with the *Rural New-Yorker* folks, that these flea-beetles would soon get out of fashion—at least for a year or two; but we now have more of them than ever before, and they are on the foliage of our potatoes. I have been watching them on the potatoes for several seasons, and have supposed that they did not do any very great harm; but, my friends, it seriously cripples any plant to have the leaves all gnawed up and perforated with little holes. It has sometimes seemed to me as if the plant got discouraged and wouldn't try, after the beautiful bright green leaves it had put forth had been riddled by some greedy enemy. Of course, we can not afford to put wire-cloth coverings over potato-plants, even if we could get some wire cloth fine enough to shut out the flea-beetle.

I now want to say a word about going to extremes in the matter of chasing bugs. I have known a few people who would spend valuable time with a magnifying-glass, and different kinds of doses recommended in the papers, to save a few plants, when the time that was given to the subject was worth a good deal more than the whole crop, even if it did its very best. The one who raises garden-stuff for market, and competes with the prices on many products, needs judgment and wisdom. Many times he had better let his crop all go, or plow it under and try something else, than to waste time and

money in dosing insects. Where cheap labor can be secured (little boys and little girls, for instance), the matter can be managed, oftentimes so as to leave a safe margin. I have paid small boys five cents a hundred for potato-bugs when they first began to show themselves in the spring. This, you know, is Terry's plan. Where boys can be hired for less money than Paris green costs, by all means pay the money to the boys. It needs a man of judgment to handle Paris green as a rule; and my experience is that a man of judgment costs considerable money for every hour you keep him at work at the potatoes. Putting something into the soil to destroy the rudiments of the insect-foes seems to me the more rational proceeding; and the guano and lime for plant-gardens—yes, and for early radishes in beds, I think gives us a pointer as to what may be accomplished in this line.

LOOKING OUT FOR FROSTS.

I want to urge again the importance of a barometer and thermometer to the gardener or fruit-raiser. For ten days past we have had very cool nights, and once or twice a little frost. The question came up each night, "Had we better go to the expense of carrying out boxes, etc., and covering our plants, or shall we take the chances?" To cover our stuff as well as we could, would take perhaps three or four men two or three hours. In fact, it would cost a dollar or two to fix well for a frost. Now, then, I will tell you how the above instruments save money. After watching the matter closely I have decided there is but little danger of frost unless the thermometer goes down to 50 or lower at sundown. Now, there is no danger at *this* temperature unless the sky should be clear at night. The barometer here indicates pretty accurately whether it will cloud up or not. On one occasion everybody was sure there would be a frost. Newspapers and pieces of cloth were flying from every dooryard; but I steadily insisted that there was no danger, and made no preparation at all, because the barometer was "away down." When some of them laughed at me, I told them that, with the present low barometer, it must cloud up or else we should have a big wind, and either one would interfere with a frost. In the morning it was very cold, but we had both wind and clouds, and no frost. At another time I decided there would be a little frost. I told the boys to cover the pepper-plants, sweet potatoes, and cucumbers. The result was, that there was just frost enough to scorch the tops of the tallest potatoes, occasionally an enterprising bean-stalk, and the edges of a few of the cucumber leaves. Nothing was greatly harmed. Of course, we put sashes over all the sweet-potato beds. Well, the sashes were covered with frost; and where the leaves and sweet potatoes touched the glass they were scorched—nothing more. The sidewalks and tops of the bee-hives—in fact, the glass of the greenhouse, was covered with frost; but the squashes, even down in the creek bottom, were uninjured. A great many thought it very strange that the squashes and cucumbers low down on the ground

were unharmed, while the sidewalks were white with frost. I knew pretty well what it would be, the night before. The sun had been shining for several days, and the ground was quite warm, and warmed down pretty deeply. This latent heat saved the vines and every thing else on the creek bottom; but in the peat swamp, however, it was a good deal worse. The reason is, the light porous peat is a good deal like the boards of the sidewalk. The air circulated under and through it so that it cooled down; while in the clay and sandy soil it did not. So far this season (May 28) we are unharmed, and the labor of covering and uncovering with us during the month of May has not cost us fifty cents.

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

HOBBIES; ESTABLISHING OUT-APIARIES.

LIKE my paternal ancestor, I find myself occasionally running into hobbies. It is one thing at one time and another thing at another. First it was chickens and pigeons; then came guns, electricity, chemistry, microscopy, and photography. Bees? Yes. They have had their fair share of patronage ever since I recovered from my first fear of the sting. Well, what is the latest hobby? It is out-apiaries. If I seem to be more enthusiastic than the subject warrants, you must lay it all to Dr. C. C. Miller, who is responsible for the fever. Of course, to keep up constant communication with an out-apiary necessitated a good traveling horse. No sooner had I purchased a good colt than my fever was horses and out-apiaries. Sometimes my mind runs on training colts, and sometimes on building air-castles in basswood orchards which a far-seeing parent provided seventeen years ago. I make this introductory, so that, if you see any thing wild or erratic, either in my writings or methods, you may be able to make a little allowance.

After we had decided upon the construction of the Dovetailed hive, we found that we had quite unwittingly blundered on to something that seemed to be *specialty adapted* to moving bees to out-apiaries. When I discovered this, and when I had become thoroughly animated by Dr. Miller's out-apiary articles, I could not rest easy till I had purchased a colt and made other arrangements to carry out, for the present, the out-apiary scheme. By the way, I know of no better fun than to go out into the country buying up bees, with a good spirited colt. I know of no better way to get fresh air; and it certainly is a pleasure to talk with the bee-keepers, here and there dotted throughout the county.

I decided that it would not do to take bees from our own home apiary. Having had foul brood in days gone by, I thought it would be a wiser way to introduce entirely new stock, and put them in an entirely new location. As we fill orders for bees by express from this apiary we were obliged to do so. Accordingly Billy (my colt), the cart,

and I started out on tours around the county, to buy up bees. Having selected the bees and having completed arrangements as to prices, etc., Mr. Spafford and our teamster, Mr. Ward, were to go out, gather them up, and locate them in the basswood apiary. By another fortunate accident, our market-wagon, although constructed specially for carrying vegetables, I found was made just right to take a lot of the new Dovetailed hives. If the wagon had been built expressly for moving bees it could scarcely be improved. The first time, in one load, our boys brought with it 29 colonies from a distance of 11 miles; with no very great crowding, it could be made to take 40. With only *two loads* we could establish an out-apiary, and the expense of hauling would, of course, be reduced correspondingly. Perhaps in the next issue I can give you a photographic view of our next load of bees, with the Dovetailed hives, on their way to the basswoods.

BASSWOOD APIARY.

Seventeen years ago our basswood orchard was set out on a piece of ground containing ten acres. I remember very distinctly helping to mark the rows, riding horseback while a stout, sturdy German held the cultivator. For my services I was rewarded 25 cents a day. As the "25 cents" began to heap up, I remember with what pleasure I thought I should get money, not to buy bees with, but to buy a gun. Little did I then appreciate the scheme of a basswood orchard which now looks so inviting to an apiarist. The trees have not grown as rapidly nor as thriftily as some of the trees that have been set out around the Home of the Honey-bees later; but it is a very pretty sight, I assure you, to look up the long rows of basswood-trees. I will try to give you a view later.

THE DOVETAILED HIVE.

As previously stated, we have nothing but the Dovetailed hive in use in the basswood orchard. The more I use them, the more I like them; and as I see the great piles of them in the flat moving off by freight, every day, it makes me feel glad to think how pleased the customers will be when they receive them. Our apiarist, Mr. Spafford, is equally pleased with them, both for moving bees and for general manipulation.

HONEY QUEEN.

In the basswood orchard, many of the colonies have had to be fed, to prevent curtailing of brood-rearing and starvation. While almost all of the other colonies are working from hand to mouth, one colony in particular required no feeding, but had secured so much honey that all the brood-combs in the brood-nest were bulged with honey that was evidently gathered recently. Besides all this, said colony was building little white burr combs over the tops of the frames. An examination of the brood-nest showed that swarming-cells were being built out. The stock was average in strength, and the bees were purely marked Italians. The queen herself is large and yellow. After I had examined the hive I came to the conclusion that *that* queen should not be sold—no, not

for any price, just now. If her bees pan out as well as they have been doing, we shall offer her queens for sale, and call them "honey" queens. You will please understand that we have no daughters of this queen for sale yet. We first want to determine whether her bees will do as well proportionately on clover, and finally on basswood.

GLEANINGS IN BEE CULTURE.

PATENTS ON BEE-HIVES.

We extract the following from Langstroth's book, newly revised by Dadant:

In closing this chapter on hives, we can not refrain from advising beginners in bee culture to be very cautious about buying patent hives. More than 800 patents on bee-hives and implements have been issued in the United States since January, 1873. Not ten of these have proved to be of any use to bee-keepers. The mention of this fact will suffice to show the small value of these 790 patents, and the loss incurred by those who have bought them before they were able to judge of their merits.

It seems to me that the above is a clincher; but I do not know where the ten are. There may be, however, 10 out of the 800 that *some* bee-keepers think are better than hives that are not patented.

MAKING IMPROVEMENTS.

We are constantly receiving devices, purporting to be some improvement upon implements already in use. Scarcely one of them is practicable. The majority of them are so expensive that no bee-keeper who looks to his bees for support can possibly afford to use them. In making improvements, we should ask ourselves, "Will the small profits at which honey is now sold warrant the cost and the introduction of the device?" Devices and implements for hives—those that are to be used in any quantity in the apiary, should be inexpensive—as a general rule, the simpler the better. Expensive hives and expensive devices will never reach a very popular demand. If honey could be sold at 75 cents or a dollar a pound, perhaps we might afford some of the alleged improvements.

THE BLACK SHINY ROBBER-BEES—SEE PAGE 456.

PROF. COOK takes it for granted that these bees are a kind of wild bee. Now, perhaps he is right in regard to those described by friend Callings; but I have noticed that some seasons, when robbing gets to be a fashion in an apiary or several apiaries, a good many bees seem to abandon honey-gathering entirely, and devote their whole time and attention and abilities to stealing. These bees, by their unnatural habits, lose their downy fur, and get slim and greasy looking, so that many people have suggested to me that they were not honey-bees at all. I have proved, however, that they were veritable honey-bees; for when basswood and clover began

to yield very profusely, these bees finally abandoned their pilfering and went to the fields and woods with the rest. Some colonies would be composed so nearly of these robbers that I have called the attention of visitors to them as I opened the hive and pointed them out on the combs. They were usually full-blooded blacks, or else had a little Italian about them, with only one very narrow band visible, and a good deal of the time even that was lacking. This would readily explain why they could come in swarms and make themselves very troublesome. I have occasionally seen wild bees enter hives, but these were so much smaller than the common honey-bee that there would be but little danger of a mistake in the matter. I think I never saw more than two or three of these little bees around the entrance at one time.

THE NAMELESS BEE-DISEASE.

LETTERS are coming in almost constantly, complaining of an unknown disease which is affecting the colonies. The symptoms given are always identical to the symptoms given in the A B C book, under the head of "Nameless Bee-disease." It is pretty evident that this trouble is getting to be more and more common. Fortunately, however, it is not a serious one. The removal of the queen, so far as we have ever known, always effects a cure. For the benefit of a good many who do not know how to recognize the disease, we give the symptoms here: The bees have a swollen appearance—that is, the abdomen is distended. The fuzz is entirely worn off, and the bee itself has a black shiny appearance, very much unlike a healthy bee. And just as soon as they become a burden to the colony the healthy ones boost them out of the entrance, where they may be seen crawling around in the grass, as if equally desirous of ridding the colony of their miserable presence. You will find quite a good many bees, doubtless, dead at and around the entrance—bees that have died from this trouble. We make this statement so that we may be saved the trouble of answering correspondents.

BUSINESS AT THE PRESENT DATE.

We have been having perhaps as large or the largest trade we have ever had since our business was started. We supposed we had ample stores of every thing that might be called for, especially sections, laid up ahead. Only a few months ago we cut down our force of hands and reduced our running time to only eight hours, to prevent getting more stuff made than we cared to carry. Well, every thing held out pretty well until about the first of May. Then orders poured in at such a rate that the largest force of packers we ever employed could not put the goods up fast enough; and when we did get packers enough to handle the business, then the foundation-room got behind; and shortly after, our great stock of sections had vanished and we were crowded in earnest for a few days. Of course, complaints began to come in pretty soon; but I believe that almost every customer was told that, by the time his complaint reached us, his goods had gone. But they did not all go as promptly as they ought to have gone. As we go to press, however, we are getting ahead rapidly in every department; and I hope that, by the time this reaches you, orders of all kinds, with very few exceptions, will be going off as promptly as usual. I have thought best to make this explanation, because some of the friends have felt a little hard toward

us. Please remember, we have admonished you in every issue of our price list, that we can not promise goods by the first train when orders are delayed until April or May. As a general thing, of late years, by the first of June the very large orders begin to slack up, and we usually have to drop a part of our hands before July is upon us.

A CORRECTION.

ON page 60, in answer to question 102, as to what is the average consumption of stores per colony, from October to May, our friend H. R. Boardman is made to say, "From 25 to 30, for *indoor* wintering." At the time, we thought these figures were pretty large. Since Dr. Mason's article on page 399 was printed, friend Boardman writes us that he meant to have said that this average of 25 to 30 pounds was for *outdoor* wintering, and he very modestly intimated that he might have made the error himself. By referring to the copy, we find that he wrote very plainly, *outdoor* wintering; and that the error was our own. With the exception of Dadant & Son, Boardman's average was the largest. We should be glad to have him tell us what is the average consumption of stores per colony for indoor wintering, from October to May. Now, President Mason, will you please "stand up" again and explain what you mean on page 399, where you say you believed "Mr. Boardman knew just what he was saying when he said from 25 to 30 pounds," and that you were "wondering if the others were not guessing"? It now transpires that friend Boardman's statement was incorrectly transcribed by the printers.

ANSWERING QUESTIONS.

WE fear that some of our correspondents are asking questions, simply for the sake of asking, and perhaps getting their names in print. Others, again, never stop to look the matter up for themselves. While we are glad to answer questions, we do not like to be obliged to go over the same ground that has already been fully gone over in the text-books. If the querists would first look in the A B C book, or whatever they may have, and if then failing to find the answer they will write us, we shall take pleasure in trying to help them out. Half of the questions we receive are already very completely answered in the A B C book. If you do not find it under the head where you expect it, look carefully in the index. The index to the A B C has been made very complete, with the special idea in view of helping beginners to find the answers to such questions as are liable to come up. For instance, the A B C scholar discovers that there are several eggs in the cell; that drones are hatching from worker-brood. This condition of affairs he has never seen before. If he will turn to "Eggs," in the index, he will come to a line that reads, "Eggs, plurality of, in the cells, 119." On this page he will find very complete particulars and instructions of what to do. Another beginner finds two fertile queens in a hive at one time. He wants to know whether that is an abnormal condition, and, if so, whether anybody else has discovered it. By the index, if he turns to "Queens," he will find under this head, "Two in one hive, pages 215, 220." Still another A B C scholar finds a peculiar kind of worm which is making galleries through his worker-brood. Thinking that this can not be right, he writes to us for information. He should first look at "Enemies of Bees." Under this head he will find "Bee-moth." Under "Bee-moth" he will find

full particulars how to recognize, how to treat, etc. Before looking over the index, think of some catch-word that will suggest the point concerning which you seek information. If you do not find it under the first catch-word, think up another till you hit it.

A. L. SWINSON ON THE SICK-LIST.

THE following has come to hand, and will explain itself:

FRIEND ROOT:—If this reaches you in time, say to readers of GLEANINGS that I am confined to my bed with pneumonia, and can't fill any orders till I am better. I am able to sit up in bed only a few minutes at a time. A. L. SWINSON.
Goldsboro, N. C., May 26, 1889.

DOVETAILED SIMPLICITY AND SIMPLICITY DOVE-TAILED HIVES (?)

SEVERAL of our customers insist on mixing the two hives, as indicated in the heading. Please remember that the Simplicity hive is one thing and the Dovetailed quite another, and the two can not be combined; that is, the feature of dovetailed corners can not be applied to the Simplicity, because the latter has beveled edges. You can easily see how this is if you put on your thinking-cap and study it out. If our customers will please bear this in mind, and not ask us to do impossibilities, it will be appreciated.

REGULATING AND RESTRAINING OUR GREAT RIVERS.

WELL, I have not got a great river to regulate and restrain. The best I can do at it is to take Champion Brook, which runs through our 18 acres; but as Champion Brook sometimes floods its banks, and makes a small river, I have got quite a little problem on hand after all. While in California I fell in love with the irrigating-ditches winding along the steep sides of the mountains. I also fell in love with the idea of protecting tender vegetation by these same hills and declivities. Well, Champion Brook runs through our grounds from west to east; and on the north side there is a steep bank where the fertility from our market-gardens washes down during a great rain. This bank grows such huge weeds that it is a task to chop them down several times a year. Now, I will tell you what we have "gone and did." On the north side of the brook, by means of galvanized gas-pipe with wire stays at the top, we have fenced up the bank so as to make a level plant-bed four feet wide. This plant-bed is just three feet above the water in the creek. On the north edge, close to the bank, is a shallow ditch, permitting us to run a stream of water clear from the carp-pond to the other side of our boundary-line; and whenever the foliage in this plant-bed needs water, there is Champion Brook within three or four feet to supply it. The whole of this bed is protected from north winds, and has every bit of sunshine that can be had, every day in the year. On this bed I propose to raise nice strawberry-plants all through July and August, no matter whether it rains or not. And next year at this time we expect to have the earliest strawberries on this plant-bed. Our good friend W. J. Green, of the Ohio Experiment Station, has just sent me a dozen of the earliest strawberries they have found in all of their great number of trials on the experiment grounds. Now, then, if the fertility from our heavily manured grounds undertakes to run off into Champion Brook again, it will just get into my strawberry-plant bed, and I mean to manage so it can not get any further.

Finally: My scheme for restraining our great

rivers is by means of galvanized iron pipe and netting—the latter like poultry netting, only heavier. Wooden piles may take the place of the galvanized iron stakes where they are under water; but where they are exposed to both water and air, galvanized iron, or rather, perhaps, galvanized steel, seems to me the material to do it with.

WE have at this date 8754 subscribers.

SPECIAL NOTICES.

SECTIONS OPEN ALL AROUND.

WE have some 40,000 of these regular width left of our stock made up in the winter. If any of our customers use or can use this kind we can send them by return train if you will specify in your order that you want open all around, or that you can use them. Remember, this applies only to sections $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{8}$, the regular 1-lb. size.

LATER.—We are up, so we can send any regular size by return train.

STRAWBERRY-PLANTS, AND SETTING THEM OUT ANY DAY DURING THE SUMMER TIME.

Perhaps you have noticed in our seed and plant catalogue we have advertised strawberries from March 1 till Dec. 1 inclusive. In order to make this possible, we first want good plants; second, we want good soil, and facilities for irrigation, or plenty of rain. Mulching may be made to take the place of irrigation largely; that is, if the ground is well soaked when the plants are put out, and then covered with mulch to prevent evaporation. We have been having a very brisk trade in strawberry-plants all through the spring, and are sending them considerably yet, even to the present time, May 30. It is true, it is a little difficult now to get any that have neither fruit nor runners unless they have been clipped off in anticipation of using them to send off. But we now have plants with great strong healthy runners extending a foot or more, and ready to take root at our first good soaking rain, which came last night. Shortly after this reaches you, we shall probably have well-rooted young plants. I do not remember that I have ever before had runners taking root by the first of June.

ADVANCE IN THE PRICE OF BEESWAX AND COMB FOUNDATION.

On another page of this issue you will find a notice of an advance in price of 5 cts. per pound on foundation, both wholesale and retail, by Dadant & Son. We are also compelled to make a similar advance. The reason is, a scarcity of wax and a consequent advance in price. This advance takes place June 1, and will hold until further notice. We will pay a corresponding advance in the price of beeswax; namely, 25 cents cash, 28 cents in trade for fair average wax delivered here; 1 to 3 cts. extra for select quality, especially that rendered in the solar wax-extractor. Price of wax to those who wish to buy will be 30 cents for average, 35 cents for selected. The revised prices on foundation will be as follows:

Packed in neat boxes, with tissue paper between every two sheets.		Heavy brood, 4 to 6 ft to lb	Light brood, about 7 ft to lb	Thin, surplus about 10 ft lb.	Extra thin flat bottom about 12 ft lb.
1 to 10 lbs. per lb.		45	48	55	60
10 " 25 " "		44	47	54	59
25 " 50 " "		43	46	53	58
50 " 100 " "		42	45	52	57
100 " 200 " "		41	44	51	56

KIND WORDS FROM OUR CUSTOMERS.

I received the queen sent, in good order. She is now laying, and is in fine condition.

DR. C. T. VAN OSDOL.

Allensville, Ind., May 14, 1889.

It is just four days since I received the bees from you, and transferred them into a hive. They are building comb nicely, on foundation. I saw the queen. She seems lively.

Fruit-Press & Vegetable-Strainer.

Reduced to Only 25 Cts.; \$2.75 per Dozen.

We have been using and selling this little implement since February. We are so well pleased with it, and the words of customers have been so full of praise, that we feel confident in saying that no housekeeper would be without one a single week if they knew its value. You can not imagine what a tempting dish you can make of potatoes till they have passed through this press. They are simply delicious. Some of our folks would scarcely ever eat a potato till we began using the press, and now they like them. The fruit season is just coming; and if the press proves as valuable in this capacity as for mashing potatoes, it should be as indispensable to the home as a rolling-pin or any of the common utensils found in every home. Believing that so good an article should be within the reach of all, we have bought 5 gross in order to get them at a price to enable us to sell them for a quarter by handling for a small profit. The usual price is 40 or 50 cts. Our price now is only 25 cts. each; 5 for \$1.15, or \$2.75 per dozen; \$7.00 per box of 3 dozen. By mail, 20 cts. each extra.

A. I. ROOT, Medina, Ohio.

Choice white-clover honey, 1-lb. sections, 14@15; fair buckwheat, 12@13. Extracted, white clover, in cans, 7@8c; bbls., 6@7; Southern, 5@5½ for good; dark, 4½@5. *Beeswax*, prime, 23c. W. B. WESTCOTT & Co., June 10. 320 N. Main St., St. Louis, Mo.

CHICAGO.—Honey.—The old crop is about exhausted, and not any new has been offered, especially is the foregoing applicable to the state of the comb-honey market. Extracted, very little demand; prices 7@8c. *Beeswax*, 25c, and scarce. R. A. BURNETT, June 10. 161 S. Water St., Chicago, Ill.

NEW YORK.—Honey.—Our supply consists of 'extracted California only, quotable at 7@7½c. New Southern is sold as fast as it comes in. Orange blossom, at 7¼@7½c per lb. Lower grades at 65@70c per gallon. *Beeswax*, 27½c. F. G. STROHMEYER & Co., June 10. 122 Water St., N. Y.

MILWAUKEE.—Honey.—This market is good for the season. Prices are firm on good qualities, either extracted or comb. The old crop is being closed out. We quote 1-lb. sections, white, 15@16c; 2-lb., nominal; 1-lb., dark, 12@13. Extracted, white, in tin pails, 9@10; in kegs and half-bbls., 8@9; medium, in kegs and half-bbls., 7½@8. Dark wanted, 5c. *Beeswax*, firm, 25@28. A. V. BISHOP, June 6. Milwaukee, Wis.

NEW YORK.—Honey.—Extracted honey is in good demand. We quote fine orange bloom at from 7@7½. Lower grades and off quality, at from 65@70c per gallon. *Beeswax*, very scarce. A good article will sell on arrival at from 26½@27½. HILDBRETH BROS. & SEGELKEN, June 6. 28 & 30 West Broadway, N. Y.

BOSTON.—Honey.—We have less than 20 cases of honey on hand of all kinds. Sales very slow. 1-lb. sections sell from 16@18c; 2-lb., 15@16. Extracted, 8@9. *Beeswax*, none on hand. BLAKE & RIPLEY, June 10. Boston, Mass.

ST. LOUIS.—Honey.—Demand fairly active, but prices tending lower on account of increased receipts. Choice bright, 6½; dark, 5@5½. *Beeswax*, prime, 23. D. G. TUTT GROCER CO., June 10. St. Louis, Mo.

DETROIT.—Honey.—Very little honey in the market, and very dull sale at 12@14c for comb. *Beeswax*, firm at 24@25. M. H. HUNT, June 10. Bell Branch, Mich.

ALBANY.—Honey.—Market slow, with no stock and no demand, being between seasons. H. R. WRIGHT, June 10. Albany, N. Y.

KANSAS CITY.—Honey.—We quote white 1-lb. sections, 15@16c; dark, 10@12; extracted, white, in cans, 7@8; bbls., 6@7; dark, 5@6; white, 2-lb. sections, 11@12; dark, 9@10. CLEMONS, CLOON & Co., June 10. Kansas City, Mo.

WANTED.—Several hundred pounds of nice extracted honey, white clover and Spanish needle in their season. Who will furnish it? Send sample and price, delivered at Mt. Vernon, Jeff. Co., Ill., freight paid. W. W. ADDISON, Bumpus, Jeff. Co., Ill.

Garniolan Queens.

Importing and breeding this race exclusively since 1884; the demand for them has more than doubled each season. Send postal for circular, or \$1 for choice untested queen; \$5 per half-dozen. S. B. Minton's best grade imported queen. 11ftdb

\$ S. W. MORRISON, Oxford, Chester Co., Pa.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid in the U. S. and Canada. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries not of the U. P. U., 42 cts. per year extra.

OUT-APIARIES.—NO. IX.

WHAT KIND OF A HIVE IS BEST FOR HAULING?

A FEW words about hives. Don't be frightened. I haven't invented a new hive. I only want to say a little about some features of hives that make them objectionable when it comes to hauling to out-apiaries. The nearer a hive can come to being a square box, with no projections of any kind, the more compactly a load of them can be put on a wagon. I like outside cleats, for easy handling. I have always been used to them, am prejudiced in their favor in spite of the fact that they add weight and expense to a hive, and I can hardly imagine how it can be so easy to pick up a hive of bees with no cleats, only hand-holes. In spite of all that, if I were starting anew I think I should have hives without cleats on the sides and ends. When it comes to loading them on a wagon, these cleats add nearly two inches to the width of a hive, which makes quite a difference in the number of hives that can be got into a given space. For getting as many hives as possible into a given space, nothing is better than a hive that has no cleat, no projection of any kind. Suppose a frame $17\frac{1}{2}$ inches long is used, then a hive *about* 20 inches long is needed; and if ten frames are used, about 16 inches in width. Now, with hives 20x16, solidly fastened together, no projections anywhere, they can be packed close together instead of being blocked apart as mine now are; and instead of 11 I could have at least 15 on the same wagon.

Of course, if you winter your bees on their summer stands, you will have comparatively little hauling to do. If you happen to be in that border land where it is a question whether it is best to use chaff hives, and winter on summer stands, or to use single-walled hives and cellar them, then out-

apiaries will turn the scales in favor of the chaff hives, for it will save so much hauling. In that case it might be desirable to have a few single-walled hives, as a matter of convenience, to haul occasional colonies or frames of brood from one apiary to another, transferring them when hauled into chaff hives.

PREPARING HIVES FOR HAULING.

If I knew just what kind of hives you have I could perhaps tell you exactly how to prepare them for hauling. As it is, I can give only some general directions. If your hives have fixed frames, at least so far fixed that they can not get out of place, then nothing is to be done with them. Indeed, if you have the ordinary hanging frame, all wood, resting on wood rabbets, then no fastening is needed if the frames are just as the bees left them the previous fall. If you expect to haul such hives without fastening the frames, you must not over-haul them in the spring before hauling, for then you will break loose the bee-glue and bridge-combs by which the bees have fastened them. If you have metal-cornered frames, or if for any reason your frames are loose, then they must be fastened. Perhaps you have spacing-boards, or some special means of fastening them. If you have nothing of the kind, then you might try a plan I have used. Generally I haul without doing any thing to the frames, trusting to bee-glue and bridge-combs. Sometimes, however, I fill a hive with combs from a number of other hives, in which case the frames must be fastened in their places. I simply thrust down a stick between the ends of each two frames, and between the outside frames and the side of the hive. These sticks—22 for a 10-frame hive—are from $\frac{3}{4}$ of an inch to an inch wide, somewhere in the neighborhood of half an inch thick—just thick enough so they will fit in pretty tight—and long

enough so they will rest on the bottom of the hive and project at the top a fourth of an inch or so, just enough so you can get hold of them to pull them out. These sticks you can put in at your convenience the day before you want to haul off course, bottom and top must be fastened securely, for there must be no possibility of leaking bees on the journey. C. C. MILLER

Masonica, III.

Well, I declare, old friend, if you had planned to give the *Simplicity* hive a boost, without saying a word about it—that is, without using the word "*Simplicity*"—you could not have done much better than you have in the fore part of your remarks. With the *Simplicity* hive, however, I planned the metal-cornered frames, and these you don't fancy a bit, it seems, especially for out-aparies. Now, look here: If you conclude to use chaff hives for out-aparies, use the metal-cornered frames in these chaff hives, and all-wood frames in *Simplicity* or Dovetailed hives that you use only for summer use. We used the sticks for spacing the frames—22 in number—years ago; but we very soon decided that they were altogether too much machinery. Then we made a spacing-board; but the boys have just lately, while buying bees and removing them to the basswood orchard, decided that the spacing-boards were too much trouble, and so they have got up some spacing-strips. Ernest says it is the same thing used by Manum, to be described later. I think our experience agrees almost exactly with yours on all the other points you mention.

MANUM IN THE APIARY WITH HIS MEN.

PRACTICAL AND REASONABLE SUGGESTIONS FOR VETERANS AS WELL AS BEGINNERS.

JUNE 25.—"Good-morning, Fred! I have come to spend a few hours with you to-day to help you clean up with your work."

"Good-morning, father. I am very glad you have come for that purpose, for I have had so many swarms for the past three days that my work is a little behind, especially looking after the boxes. I have a number of colonies to look after to-day—some new ones to look over, to see if the foundation is all right and being drawn out properly; and some that have cast swarms have got to be looked after to put out queen-cells or to see if the queens have hatched, or have commenced laying; and, besides, I ought to examine all of my nuclei to-day."

KEEPING GRASS AWAY FROM THE ENTRANCE.

"Well, sure enough you have got a good day's work before you. I notice you have mowed your yard, but you have not clipped the grass that grows near the hives. I suppose you intend to do that with the scow shears. It looks rather shabby as it is. You know I like to have the yards look tidy at this season at least. Suppose Mr. Root or any other one-cropper should visit your yard to-morrow, I fear you would be ashamed of its appearance. I know you have been very busy for a few days; therefore you are excusable; but as soon as you can I wish you would stick up a little."

"All right, father. I will do it in the morning early, before swarming commenced. Here is a col-

ony I wish you would look at. They don't seem to gain in strength, and I don't believe the queen is a good one."

NOT ALLOWING A POOR QUEEN TO REMAIN IN THE APIARY.

"All right; open the hive and find the queen. There she is, just going over the edge of the comb. Ah! I see; she is one of those long, slim, very yellow queens; and, besides, she has one lame leg, though she is laying pretty well; but her bees are small, frail things; they are not hardy enough for this climate. Show me the record. Ah! she is a daughter of the queen I got of Mr. ——. They are beautiful bees to look at, but that is not what I keep bees for; hence I will pinch off her head—there! You may hive a small swarm in here to-morrow, because the colony is too light to store much honey as it is; and by giving it a portion of a swarm with a good queen we shall get something from them. Always remember that a light stock at this season is worthless for storing honey, hence you should manage as best you can to keep every hive running over full of bees, as such only are the ones that give us large quantities of "snowflake honey."

LAY BEES—HOW TO MAKE INDUSTRIOUS.

"Father, here is another colony I wish you would look at. I have tried my best to get them into the boxes, but have failed. You see the hive is full of bees, and the front well covered with them; but they won't work. I have given them sections from other hives partly filled, and I have shaken every bee off the combs in front of the hive to "wake them up" as you have recommended, but still they are idle when all the rest are doing well."

"Yes, Fred, I understand that colony—or, rather, I think I do. They are like some men that I know of, perfectly contented and happy if they have one meal ahead. They lack energy. I will play them a trick by taking away all their combs and filling the hive with frames of foundation. There, now, we will also give them two clamps of new sections. Now you see they have got to work or starve. The brood we have taken from them we will use wherever we can find a place for it. Now I will go through the yard and look to the sections, as I presume some will need tiering up. Yes, here is one with the foundation all drawn out and capped half way down. The way to do it is to remove the clamps and set them up edgewise on this clamp-stand and remove any brace-combs that may be attached to the bottom. Now place the clamp of empty sections and then place those partly filled on top of them. Be sure that the spaces, or passages, correspond, so that the bees can pass up and down. Here are a few finished sections in this other clamp, which we will remove and put empty ones in their place. You must look to this and remove all finished sections as soon as possible before they become soiled by the bees passing over them. I have brought a bag of fine salt for you to sprinkle on the floor where you are to set the clamps of filled sections. The salt will keep the ants away from the honey. Don't be sparing with the salt; use enough to make the floor look white. Well, I will now return home and work in the home apiary the rest of the day."

JULY 1.

"Good-morning, Edward! How goes the battle?"

"Pretty well, Mr. Manum. I am not having many swarms now. I think they are about through swarming, but are they getting honey as fast as

they did. They gained only 4 lbs. yesterday. Well, that is pretty good on the last run of clover. Sumac will bloom in about five days; and if the weather is favorable they will do pretty well for four or five days, and then comes the basswood; and I hope by that time swarming will be all through with, as I don't want a single bee to lose a moment's time during basswood bloom."

"Have you had any second swarms this season?"

"But one, and that was owing to my neglect. I have followed your instructions as given in GLEANINGS of Apr. 1, and with what you have told me from time to time I have succeeded nicely in preventing after-swarms."

"JUMPING" SECTIONS.

"We will go over the yard together, as I wish to show you how I jump sections. I ought to have shown you when I was here the other day, but I did not think of it. Here is one that needs it. You have doubtless observed that the bees are slow to fill and finish the sections at the ends of the clamps. They will often fill and cap the center ones before even drawing out the foundation in the end ones; and in order to have the whole clamp finished up altogether, I 'jump' them by placing the end ones in the center and putting the center ones at the ends, as these center ones are so well advanced they will be finished by the time the empty ones are that we have just put in the center. This work I call 'jumping.' Now, when doing this work you occasionally find a finished section; in that case, remove it entirely and take it to the honey-house and fill its place with sections filled with comb left over from last year, of which we have a plenty reserved for this purpose. How about this record here in this hive? I see it reads, 'June 26, hived from 91.'"

"Yes, sir, this queen is from 91."

"How old is she?"

"One year old."

"How do you know?"

"Well, I remember that is the age recorded in the hive she came from."

"Very well. You remember now; but would you next spring? Or suppose I come here next spring or send some one else, I should have to go to 91 to find the age of this queen. If your records are all like this it will cause us much extra travel another year. You should have made the record thus: 'June 26, hived from 91, queen one year.' Please be very particular with the records. They are very important to me, as I wish to know the age of every queen."

"You are right, Mr. Manum. I now see the importance of having the records properly made out. You had explained this to me before; but I had forgotten. In fact, you tell me so many things that I can't remember them all."

"Yes, there are a great many things to explain about the bee-business, and I never yet had a man who could remember all I told him, and that is just why I am looking around after you. A slight mistake at this season of the year might cost me the use of one or more colonies; therefore be very careful and try to do just as I tell you, then if there are any mistakes it will be my fault and not yours."

JULY 3.

"Fred, how does that colony get along from which we took the combs all away and gave foundation?"

"They are doing nicely, father. I looked into the

hive last night, and they had the foundation all drawn out in the frames and boxes, and filled with honey except where the queen had deposited her eggs. I hear that bees work as they have since you played that trick on them. Where are you going to-day?"

"I am going to visit Will. I have not been in his yard for over a week. I just thought I would drive around this way to inquire after that colony. Sumac is just opening, and you must look well in the boxes; don't let the bees lack for room now."

"How do you do, Will? This is a pretty warm day."

"Yes, sir; it is so warm I was not looking for you to-day."

"Well, I have to start out whenever I get the work done in my yard so I must leave. Do you notice any difference in the working of the bees to-day?"

"Yes, I do. They started out earlier this morning than usual; and I also notice that they are very busy; and yet I do not hear so much of that humming as I did before. What are they working on now?"

"They have commenced on sumac. It commenced to open yesterday, and to-day it is nearly in full bloom. It will last only four or five days, and then comes basswood right after it; therefore you must look well to the boxes and be ready for the rush. If you should have any swarms come out now you may hive two or three in one hive, or hive a new swarm in where one came out the day before. There is a swarm coming out now. Did you have any swarms yesterday?"

PERMITTING SWARMING BUT PREVENTING INCREASE

"Yes, sir; one only. They are nearly done swarming now; there are only six more to swarm; this is the one that swarmed yesterday."

"Well, that swarm is clustering on the entrance all right, so that you may come with me and I will show you how to fix 28 to receive the new swarm. You say you hived the swarm from 28 in 96; therefore we will take six combs from 28 and give them to 10 in exchange for six frames of their foundation. Now, one foundation we will put into 28, there, now out all the queen-cells out of 28. This hive is now ready for the new swarm which you may hive in here at once; and as their two clamps of sections are pretty well advanced, I will give them one more clamp. There, now I think you had better do the same with the next swarm you have out by putting it into 18, where this one came from. This method will prevent increase, and keep every colony strong, as they should be now for the next 15 or 20 days. You may now introduce virgin queens into those twenty colonies from which we removed their queens to experiment 911 Elwood. It is 18 days to-day since we took the queen away. Give each colony a virgin queen as soon as they are hatched; don't keep them longer than you can help before introducing, or you may not be as successful. While virgin queens may be introduced two or three days old there is more risk at that age than when only a few hours old. You may simply let them run in at the entrance, or run them in by way of the sections and then in about 24 hours look in front of the hive for her. If the bees have rejected her you will find her there dead; if not, she is all right. In ten days you may look to see if she is laying; if so, reward her Q. L. with date."

Bristol, Vt.

A. E. MANUM.

You have given us some good points, friend M., and quite seasonable. The first one reminded me that the grass has not yet been cut in our apiary. We are not getting a honey-flow to any extent here at this date, June 11, therefore we are not having experience in the line of the rest of your remarks at the present time. Jumping sections is often managed by having the crate over the frames made in two pieces. When the bees begin to seal up the central sections, the two cases can be swung around so the outer ends come over the center of the brood-nest. This is how you do it, I believe.

HUBER, AGAIN.

ALSO SOMETHING IN REGARD TO HUISH, WHO SO SEVERELY CRITICISED HUBER.

IN GLEANINGS for May 15, you have given an excellent engraving of Huber, if Naturalist Library, Vol. 7, edited by Sir William Jardine, Edinburgh, 1852, in its frontispiece, gives a correct likeness of this great naturalist. A memoir is also given of Huber. His was a great mind, and I delight to read any notice of him. What a contrast between him and his cotemporary Huish, who undertook to refute by ridicule his discoveries. In the new edition of his work, Robert Huish, F. Z. A., and Honorary Member of the National Institute of France; the Academy of Arts and Sciences of Gottingen; the Agricultural Society of Bavaria, etc., a work of 458 pages, London, 1844, in his preface, says: "If in the course of the ensuing work we may have laid ourselves open to the charge of having applied the lash of ridicule too severely upon this falsely celebrated naturalist, we can only answer, in extenuation of that transgression, that we have been encouraged to the commission of it by the thorough conviction arising from an experience of above forty years, that the majority of the vaunted discoveries of Huber are the result of fiction and delusion founded on obsolete theories and antiquated prejudices."

How hard for him who had and was enjoying the distinction and society of the learned, to acknowledge that what he had so frequently taught in lectures, and published, were errors, even when made so plain and demonstrable as laid down by Huber!

I note some errors which occur in the 24th and 25th chapters of Huish's work; to wit:

Common worker-bees are of the neuter gender; they collect honey and make wax.

Bees deprived of their queen will not work.

Swarms are always accompanied by a young queen, but never by the mother-queen.

Wax is formed by an elaboration of the farina of plants.

The queen lays every egg in the hive, and is, in fact, the only female in it.

The drones are the males, and fecundate the eggs of the queen as they are laid in the cells.

The bees allow but one queen in the hive.

The queen oviposits only in the spring and summer, and *never* in the winter.

The queen is not fecundated by any act of coition with the drone.

No kind of food is administered to the worms in the cells.

There is no such substance in a hive as propolis.

The bees never make use of their stings in the massacre of the drones.

The queen never makes use of her sting on any occasion whatever.

The hive which has lost its queen can not rear another unless there are royal eggs in the hive.

Bee-bread is not applied to the nutriment of the bees, or as food of the larvæ.

The queen-bee has not the power of emitting any sound whatever.

The queen-bee pays no attention whatever to the royal cells.

A hive is not worth keeping after the fifth year.

Bees can not alter the generic character of the eggs under any circumstances whatever.

Bees work their combs always parallel with the entrance.

He devotes 40 pages descriptive of the different hives, specifying their advantages and defects, and gives two illustrations of the Huber hive. When he comes to speak of the "mirror, or experimental hive," he says: "It is to this hive we are indebted for many of the discoveries of Huber and Dunbar, especially of the latter naturalist; for in regard to the former, it appeared to be to him a matter of perfect indifference in what hive his experiments were carried on, for the results were always in perfect unison with his anticipations."

Murfreesboro, Tenn.

W. P. HENDERSON.

It seems sad to think that Huish should have been so unwise as to ever put in print his unkind criticisms. What a record for future generations! and yet while I read over the mistakes made by Huish, I feel to pity him more than to blame him; for in almost every one of the quotations there is a grain of truth; and we, with all of our later experience, can readily understand how he came to fall into most of his errors. In fact, a great many even now would indorse many of the statements. Yes, if we look back over our own bee-journals we shall find some pretty good men who have taken almost every position held by Huish. Let us be slow to criticise, and never think of taking the "lash" into our hands, unless the good of humanity demands that the deliberate thief and swindler be held up to public view, or something of that sort.

POLLEN AND HONEY FROM THE WILLOWS.

POLLEN-PRODUCERS.

A CORRESPONDENT asks: "Is there any other name for bee willow, or how can I tell it from other willow?" In reply I would say, that, so far as I know, all willow is "bee willow," for all of them with which I am acquainted yield either pollen or honey, yet some of them are more eagerly sought after by the bees than are others. Among the pollen-bearers we have several kinds of what is known here as "pus-sy willow" (*Salix*), which put out their blossoms quite irregularly. Some are a month earlier than others, and some of the buds on the same bush are ten days later than others. The kinds which seem to attract the bees most are the black willow, upon which the kilmarnock is budded, and those which produce a long cone-like flower similar to the black willow, the accompanying cut giving a fair representation of the latter, a week or so after it is through blossoming and has partially gone to seed.

From these two kinds the bees obtain large quantities of pollen, but, so far as I can ascertain, no honey. As this pollen comes the first of any which we have which amounts to any thing, I esteem it of great value to the bees. Skunk-cabbage gives pollen a little earlier, but we do not have enough of it to amount to much, compared with what these willows give. The flowers are of a rich orange color, and consist of a center out of which spring hundreds of little thread-like filaments, upon which the pollen is supported. It is very interesting to see the bees work on these flowers, as you can see their motions so plainly, for the tree or bush does not grow so high but that some of the lower limbs are about on a level with the eye. Here is a peculiarity of the willows, for all those in this section which give pollen grow in a bush form, while all of those which yield honey grow to be quite large trees, often reaching six feet in circumference.

PUSSY WILLOW.

The pussy willow naturally grows on low swampy ground; but with a little culture to start, it will grow readily on dry ground. They grow readily from cuttings put in the ground in early spring, as does all of the willow tribe. The above are often set down as "honey-plants;" but according to Quinby and my own observation, they produce no honey. As they grow very plentifully about here, I have had much observation regarding them. To be sure, the bee is continually poking its proboscis into the blossoms, the same as they do when sucking for honey; but after killing many bees and dissecting them, I have been unable to find the least bit of honey in their sacs. This way, if used when the bees are at work on any of the honey-bearing flowers, never fails to reveal honey accumulating in their sacs.

HONEY-PRODUCERS.

Of these we have three kinds—the golden willow, the white willow, and the weeping willow, and they are of value as honey-producers in the order named, although the weeping willow blossoms about three days earlier than the others. This would make it of more value to the bees, even did it not yield honey quite so profusely, if there were enough trees to keep the bees busy; but as there are very few trees of this kind about here there is not enough to make any account of. None of the three willows mentioned here give any pollen that I ever could discover, for none of the bees at work

on these trees ever have any pollen in their pollen-baskets. If there is any species of willow which yields both honey and pollen, I am not acquainted with it. The flowers are similar to those which grow on the birch and poplar, being of a long tag-like shape, as large as a slate pencil, and from one to two inches long. Those on the golden willow are the longest, and yield honey abundantly.

GOLDEN WILLOW.

The engraving presented herewith so nearly represents the golden willow that any one should know it in connection with its yellow bark, which distinguishes it from the other kinds of honey-yielding willow, as all of the rest, so far as I know, have a light-green bark. When these willows are in bloom, and the weather is warm, the bees rush out of their hives at early dawn, and work on it all day long as eagerly as they do on clover or basswood. The blossoms often secrete honey so profusely that it can be seen glistening in the morning sun, by holding the blossom between you and that orb, while the trees resound with that dull busy hum, so often heard when the bees are getting honey, from morning till night. As this is the very first honey of the season, I consider it of the greatest of value to the bees, for the brood is now crowded forward with great "vim," which brood gives us the bees which work on the white clover, while the honey often helps very greatly in piecing out the depleted stores of the hive. These willows blossom a little in advance of the hard maple, and hold out as long as they do; and from the fact that, when I kill a bee at work on these willows I always find honey in its sac, while when I do the same with a bee which is at work on the maple I never find any honey, I have been led to think that perhaps those reporting honey from maple might be mistaken, and that the honey really came from the willows. Again, maple blossoms only every other year with us, while the willows never fail; and I have noticed for years that I got fully as much honey in the years when the maples did not bloom as I did the years when they did. From the few trees along a small creek near here, my bees frequently make a gain of from six to ten pounds of honey while the willows are in bloom, and one season they made a gain of 15 pounds. This present spring some of my best colonies gained 8 pounds, while on apple-bloom they did not get more than a living, with apple-orchards white with bloom all about. The honey

from the willow is quite similar to that from the apple-bloom, and of a nice aromatic flavor. As the willows give the first pollen, and also the first honey each season, it will be seen what a great help they are to all who have them in profusion near their bees. The only drawback there is, is in the weather often being unfavorable, for I do not think that more than one year in three gives good weather all through the time the willows are in blossom. So far as I know, honey and pollen are always present in the respective kinds when they are in bloom; but the trouble is, that it is so cold, rainy, cloudy, or windy for the bees to get to the trees so much of the time, at this season of the year, that honey or pollen from this source is not at all certain.

G. M. DOOLITTLE.

Borodino, N. Y., May 30, 1889.

Notwithstanding your strong points in favor of the willow, it hardly seems to me that it would pay to plant it for honey alone. If it could be made to serve the purpose of a hedge, or to restrain the banks of a creek or river, or something of that sort, then we might afford to do it. In our locality miles of willow were sold years ago, as a hedge-plant. I have never been able to see, however, that they bore very much honey or pollen either, unless it was during special times for a few days. Perhaps you can tell us which class of willow it belongs to. On the banks of the Mississippi River, in the vicinity of New Orleans, I believe they often get considerable yields of willow honey. Perrine, you may remember, made mention of it. The quality is hardly first class. It has a taste considerably like much of the Southern honey.

BEE-STINGS AND RHEUMATISM.

SOME POSITIVE AND CONVINCING TESTIMONY AS TO THE VALUE OF THE BEE-POISON.

IN the May 15th issue of GLEANINGS, F. Brown gives his experience with rheumatism and bee-stings, and here is mine.

About fifteen years ago I sprained one of my knees. I was lame for a few days, and it got better; but the lameness, accompanied with an ache, came again; and as time passed on it continued to come worse and worse until it got so bad I could neither straighten my leg nor bend it up; and if by accident I did move it from just such a shape it was like biting on the nerve of a decayed tooth. The pain not only stayed at my knee, but extended above and below, and acted as if it had come to stay. I tried a magnetic battery some. I used liniment externally, and "sure cure" internally, with but little relief and no cure. Three years ago we bought five colonies of bees, and with them came the stings, and next the relief. I have not suffered as much from my knee in the whole three years, as I have in some three minutes previous to the stings. I have used no other remedy within this time. I am a farmer, and my work has been very much the same.

Now, I am not going to say that bee-stings have cured my rheumatism; but if I had employed a doctor, with the understanding of no pay unless successful, I am very sure he would call for his pay.

W. M. STACY.

Edgar, Clay Co., Neb., May 30, 1889.

You have given us a very important fact indeed, and one that seems to be pretty conclusive. However, as rheumatism often "lets up" of itself, in about the way you have described, *may be* the bees have nothing to do with it. You did not tell us how it was in winter time. I suppose there are several months when you do not get stung at all, unless, indeed, you get bees and get stung purposely during the winter.

CLOVER BLOAT.

CAUSE AND CURE.

MR. W. W. BOWLBY desires me to explain the cause of clover bloat. He states that thirty milch cows in his neighborhood—Southern Illinois—have recently died of this malady.

The fields, he says, are carpeted with white clover, and the season has been very dry.

This trouble is known as "bloating," *Tympanitis*, and hoven. It is really gaseous indigestion of the first stomach, or paunch. It is attended with great swelling of the paunch, or rumen, from the excessive formation of gas. The name *Tympanitis* comes from the fact that the belly swells out, so that it becomes as tight as a drum-head. This disease is most likely to appear in weak and poorly fed cattle when they are first turned out to clover. They stuff themselves with the succulent herbage, and, not having strength to digest it, gases are formed, and the bloating appears. The flanks swell up, the left always; the right, in severe cases, till the sides rise even above the back. The animal moans, breathes hard, reaches out its neck, distends its nostrils, grinds its teeth, often bellows and stamps, and at last staggers and dies in a convulsive fit. A greenish foam or liquid oozes from its mouth and nostrils. If the case is not very severe, aromatic spirits of ammonia—the same that is found so effective to cure sick-headache—may be given. The dose is one ounce in a quart of water every half-hour, till the swelling disappears. Sometimes two or three doses will bring relief. In very severe cases, the paunch should be pierced. This is best done by the use of a trochar and canula. The place to puncture is midway between rib and hip-bone, about three inches from the lateral process of the back-bone. When necessary, the tube or canula may be tied in and left for hours. This permits the gas to escape, and so may save the life of the animal. Animals have been saved by cutting into the paunch with a simple knife-blade. If the cattle are fat, sleek, and well fed, as all cattle should always be, there will be less danger of bloating. Again, animals should not be permitted to eat too much of green feed at once. By commencing on slight rations, and increasing gradually, the trouble will generally be avoided. If cattle are turned first on pasture where there is but little clover, and later where there is much, and only for a few minutes for the first few days, increasing the time a little each day, there will probably be no serious trouble. The clover when wet is still more harmful.

Agricultural College, Mich.

A. J. COOK.

Friend C., in the above you give us some real, practical common sense in the way of veterinary surgery. I shall become a strong convert to doctors and medicine if you give us some more such examples. I wanted you to tell us, however, what gas it is that

distends the poor animals, and how it is that ammonia neutralizes the gas and diminishes the pressure. My father used to give his horses saleratus water, when they suffered from colic; and though I was a small boy, my knowledge of chemistry suggested that the saleratus water might absorb the gas so as to relieve the pressure and set the animal at ease in a few minutes, which indeed it did. Now, this matter of giving relief by a surgical operation has reason to commend it, especially if the animal quickly recovers from the wound made through its side.

HONEY-DISPLAYS.

VARIETY IN ARRANGEMENT, ETC.

THERE has been a good deal in the bee-papers of late, respecting the best method of arranging for and setting up honey-shows. If these be made large and attractive, they serve a good purpose in promoting the interests of bee-keepers by attracting attention and promoting sales. To do the work well is no easy matter. This arises mainly from the absence of variety in the article shown. Extracted honey is extracted honey in whatever form it may be shown. Monotony can be broken only by variety in the design of the packages in which it is put up, which is in itself limited. The same may be said, but in a still more marked degree, of comb honey. I suppose the main object the writers have in view in these articles is to aid bee-keepers in making good displays at local fairs. It is noticeable, that those who have treated the subject describe the methods followed by themselves or those they have seen adopted by others, which have met their approval. At honey-shows the competitive prizes are usually confined to the *quality* of the article shown, and it is upon this that judges usually base their awards. This is right as far as it goes, but the prime object of honey-shows is to attract attention and advertise the goods. As ninety per cent of the visitors at fairs can not tell, by cursory inspection, between what is good and what is poor in quality, it follows that attention should be given to appearance. To this end a departure from the usual rule can not be made too soon. Prizes should not be confined to quality. Good taste and neat arrangement should come in, be recognized, and rewarded. This may be done without injustice to any one. A man with 200 pounds of honey may make as neat, tasty, and symmetrical a display on three feet space as one with 4000 pounds can make on 20 feet of space.

Any hard and fast rules laid down for the form of staging upon which exhibits are to be set up are entirely useless. It is manifest, that, to do justice to all, no competitor should have advantages over his fellows in a more advantageous arrangement of the framework upon which the show is to be made. It follows, then, that, whatever the design, the staging should be uniform throughout. The taste and ingenuity of the respective exhibitors will then be brought into play in the superstructure he raises to show his wares.

Most of the designs I have seen for staging are after the step-ladder style. To my thinking, this is the worst form in which staging can be built for honey-shows. It gives little or no opportunity for the exercise of judgment or the display of ingenuity in the make-up of an exhibit. If "variety

is the spice of life," it should have a place in all honey-shows. Little of it can be thrown in if this style of framework is employed. What, then, is the best form for the permanent fixtures in a building where honey is to be displayed? Where a number of people are to compete, the simplest is the best—at least this is my opinion, and the simplest is common tables. These should not be less than six feet wide. Space upon these should be allotted, in proportion to the quantity each has to show. Then each will be called upon to build up his own superstructure and decorate it. It is easy to understand, that by this arrangement variety will be secured; for every man will have his own notion of what is most suitable. These superstructures will take different forms in proportion to the amount of honey and the character of the packages to be placed upon them. I hold that no man can have a correct notion of what is the best form in which his exhibit should be arranged, without a full knowledge of what is available to make it with. How can a man suggest a design for his neighbor's show, without a knowledge of what his neighbor has to show?

Owen Sound, Ont.

R. MCKNIGHT.

Very good, friend M. I agree with you, that bee-keepers do not need to follow stereotyped ways; but many times some general suggestions are quite helpful.

REARING CELLS IN STRONG COLONIES CONTAINING A LAYING QUEEN.

AN IMPROVEMENT ON DOOLITTLE'S PLAN.

AFTER reading carefully Mr. Doolittle's articles on queen-rearing, in which he styles it "nature's way," or cells obtained under the swarming impulse; and having read a good deal lately about rearing queens in the upper story, leads me to write out my plan, which may prove a benefit to some one.

I have a Langstroth frame, with two strips of wood running parallel with top and bottom bar. I then obtain eggs from my best queen. These eggs should not be over three days old. I cut these in very narrow strips; after dipping one side in wax I stick them fast to the bars already mentioned. The frame should be bottom upward while fastening on strips. I then take these frames with eggs for rearing queens to a strong queenless colony that has been deprived of all brood and eggs, and hang the frame in the hive for one night or one day, or until they form a great many embryo cells, or cups. A good colony will sometimes start 40 to 60 cups; and if the eggs are of proper age, the cups will be formed around the eggs just hatching. I then transfer these frames, that have the cells started, to the upper story of a good strong two-story hive, with a queen-excluding board between. Every cell that was started will be worked out, and each cell approaches nearer to a natural-swarm cell than any thing I have ever seen. I have had in the last few days, by the above process, the largest and finest queens hatched I ever raised.

As soon as the frame with cells started is transferred to the upper story, I supply the same queenless hive with other eggs, and so on. The only danger is, that sometimes a queen will get into the upper story through the zinc. I think this plan is much easier than the one Mr. Doolittle gives, or at

least it is to me; for transferring larvæ or eggs to artificial or old queen-cells, starters just cut from the hives are a very tedious job. I let the bees do all the starting of cells; and when I go to manipulating them the egg or larva is in its proper place. I would advise looking after the cells oftener than under other circumstances; and as soon as they are capped they might be transferred, and other cells just started given to them. They will work out and cap several batches. I find they are willing to work out all that a queenless hive will start for them; and all that I have had worked out by this process are large and fine; fully as much difference as cells raised under the swarming impulse, as if the frame of eggs fixed as above should remain in queenless colony, where they were started and completed. I suppose most queen-breeders will understand all about how to fix strips of comb on an inverted frame. There is nothing new in this plan, that I know of, except letting the bees merely start queen-cells and then transferring the frame to a strong upper story. Any of my bees in an upper story will work them out. I think friend Doolittle deserves credit for this process, as it was suggested to me from his plan. J. D. FOOSHE.

Coronaca, S. C., May 27, 1889.

You have given us not only an important fact, but one that, so far as I know, is entirely new. If any such thing has appeared in our bee-journals I must have missed it. Had the question been asked me, "What will become of queen-cells just started in a queenless colony, if they are moved to the upper story of some colony having a queen?" I should have said at once, "The cells will either be torn down or allowed to remain where they are without any further care," and I can't help feeling a little doubt about its working every time with every colony of bees. You say any of the bees in the upper story will finish them out. Now, did you not test it while the bees had the swarming fever? If so, I can readily accept it; but at any other season, it seems to me very strange, if it proves to be true. No doubt, however, it may be in any case quite valuable during the swarming season.

CURRENT SAW-FLY.

HELLEBORE AND THE CURRENT-WORM.

MR. GEORGE THOMPSON, Geneva, Ill., sends me the larva of the currant, or gooseberry saw-fly—the currant slug. "Would it be asking too much," he writes, "that you give its habits and the remedies in GLEANINGS, that we may be fortified another spring?"

These yellow and black flies, about the size of the common house-fly, which they somewhat resemble in a general way, though these have four wings, come forth very soon after the leaves open in spring. They pair, and the female lays her small white eggs along the veins of the leaves, on the under side. The name saw-fly comes from the fact that this insect has a curious saw-like attachment to its ovipositor. Thus it saws a slight groove to receive its eggs. This saw, consisting often of a double blade, is of exquisite finish. We often boast, and with no slight reason, of the advancement in mechanical inventions of this century; yet when we study the matter closely we are not wholly

pleased. Thus if we magnify highly a knife or needle of finest finish we discover that it is rough and nicked, and looks like a sorry piece of work. Not so these insect-saws. They are elegant in finish and polish, and lose none of their perfection, no matter how greatly magnified. Nature shows us that we have room for great improvement, even in our best accomplishments.

The currant-slug, as it comes forth from the egg, is light green. Soon it sheds its skin, and becomes darker green, dotted with rows of black dots. With each molt, or shedding of skin, it increases in size, and after the last is again light green. It is astonishing how some of these larvæ eat. Sometimes we think, when we have mush and milk, or buckwheat cakes and maple syrup, that we have no inconsiderable gastronomic capabilities; yet when compared with these insects in their growing period we fairly sink into nothingness. When the slugs first commence to eat, small holes will be seen in the lower leaves of the bushes. Later, when they near maturity, the leaves seem fairly to melt away. The minute holes, the eaten leaves, and the devastated bushes, as well as the faeces of the larvæ, tell where these devourers are at work.

When fully developed, the larvæ, now nearly an inch long, pass to the ground; and just at or beneath the surface they spin gray or dark cocoons in which they pupate. In a few days the flies come forth again, and we have the second round of mischief. These insects have few enemies, and increase so fast that, unless we fight them, we must give up our currants, and the delicious jelly and *par excellence* jelly-cake. When once a currant orchard is attacked, it soon vanishes away unless we see that the slugs are put to rout.

The best remedy for this scourge is white hellebore. I have used this now for years, and always with the most evident success. Though this is a vegetable poison, it is not dangerous. I have known of its use for years, and yet I never heard of any harm coming from it.

To apply this remedy, use one ounce of hellebore to two or three gallons of water. Stir well and spray the plants by use of a good force pump, like the Whitman, or a good syringe like the Lewis. It is best to throw with force so as to scatter the poison on all the leaves. So, Bro. Thompson, just get and use some of this hellebore, and still rejoice in your jelly and jelly-cake.

A. J. COOK.

Agricultural College, Mich.

If we had insecticides that would work as surely and as easily in killing other insects as hellebore does for the currant-worm, I should feel quite happy. I have, however, never taken the trouble to make it in solution. All that we do is to get five or ten cents' worth of hellebore. Just take the paper right out into the field, make a little hole so the dust will sift out, then thump the package, or snap it, so as to raise a little cloud of dust. Let this dust drop or float on the worms or foliage, and that is the end of them. We always, however, keep a close watch; and just as soon as the smallest colony of currant-worms gets a going, they are dusted with hellebore. It works so effectually and surely that I rather enjoy seeing these worms make their appearance, that I may teach them that A. I. Root is "boss of this 'ere currant-ranch."

HOW OLD MAY A QUEEN BE, AND STILL BECOME FERTILIZED?

WISE AND OTHERWISE, FROM E. FRANCE.

IN reading my new A B C book I came across this subject on page 218. The author says, 25 days is the longest period he has ever known to elapse between the birth of a queen and the laying of worker eggs. I have always held an independent position on this matter, but have never taken the pains to prove it. Place a virgin queen, with a good colony of bees, clear away from the reach of any drones. A swarm of bees traveling over the country could perhaps easily settle down to work in just such a locality. Now, if there were no drones with them, how is this queen ever again to be fertilized? Has nature left this swarm to dwindle, and perish from off the earth, or has there been a provision made for their salvation? We all know that a virgin queen will lay eggs that will hatch good-looking drones. Those eggs will hatch in about 28 days. Now, is it not possible and even probable that the queen in this case would be fertilized by drones of her own, and then produce worker bees, and save the colony? why not? Why did nature provide that a virgin queen should produce drones unless she had some use for them? Perhaps you will say that a swarm of bees always have drones with them. Not always. I have known swarms to come off without a drone. I know it is not common for a swarm to come off without drones, but it does sometimes happen.

MOVING BEES.

In the middle of the day, when the bees are at work, is there any way to collect the bees that are out at work, and at the same time keep the bees that are in the hive from going out so we can move all, or very nearly all, the bees that belong to the hive? Yes. I will tell how I have managed several times. Perhaps you all know. All you have to do is to blow smoke enough into the hive to be moved to keep the bees that are there from going out, and wait for the field bees to come in. When they are all in, shut them in and move them. I think almost any kind of smoke will do. But I have always used tobacco smoke. The bees in the hive will need smoking a little as often as you see any bees starting out—about once in five minutes.

Almost any one will be surprised at the short time it takes for them to all get in. Of course, it depends upon what the bees are at work on at the time. When honey is coming in fast, half an hour is a long time for a bee to be gone. At other times, perhaps some would be out a whole hour; but not often. Don't smoke them too hard. It takes but a little smoke to keep the bees at home. They don't like to leave home when their home is meddled with in any way. I have bought bees five to ten miles from home, and moved them in May. When the bees are at work nicely, I smoke them three or four times and wait about half an hour, and then shut them in the hive and take them in my wagon and go home with them.

COLONIES LIVING AND PROSPERING IN THE OPEN AIR.

We keep our queens' wings clipped to prevent swarms from going off. When we quit extracting, near the close of the basswood season, our bees are usually very strong, and sometimes swarms issue. The queen's wing is clipped, and she can not go. Our hives stand on five stakes, leaving a space of

from 6 to 10 inches under the hive. When the swarm returns to find the queen they sometimes find her under the hive. The bees cluster under the hive with her, and soon go to work there in the open air, with no protection except the hive over them. As we have done extracting, and have no work to do in the yard, it often happens that it is six or eight weeks before we see them; and if there happens to be a fair run of fall honey, those swarms will have from a peck to half a bushel of comb built. They sometimes have from 10 to 25 lbs. of honey, and are breeding the same as bees in the hive. I once had a case of that kind that stayed under the hive until Christmas, and were then in good order. The snow was 6 inches deep, and the thermometer had been down to zero two or three times. As they had honey enough to winter them, I have always been sorry that I did not leave them until spring. I believe they would have come through all right. There was no stock running in the yard, and the blue glass had grown up thick around the hive, so they had some protection. The grass hid them from sight, so that was the reason they were not seen before.

Last season we found one swarm under a hive when we were preparing our bees for winter. This was in November. They had about half a bushel of comb, and about 10 lbs. of honey. There was no grass to hide them. We could see the combs ten rods away; and the strangest thing about it was, they had not been robbed of their honey. As the hive directly over them had been full of honey, and had been cleaned out by the bees, there was nothing in it but empty combs. No doubt the swarm under the hive came from the one above; and the upper one failed to mature a queen, and dwindled away and was cleaned out by the bees in consequence. It doesn't look as if it were possible for those bees to so protect their combs of honey from robbers, with no protection around them; but such are the facts in the case. We have from none to three or four every year of swarms under the hives in this way, and seldom are they disturbed by the other bees.

A QUESTION.

How is it that bees can build combs out in the open air when there is so much talk about confining the heat in hives and supers to get combs built? Why is it so necessary to contract the entrance of hives to secure the bees from robbers?

Platteville, Wis.

E. FRANCE.

I have thought of the same thing you mention, and I used to wonder, as you suggest, if it were not a safe provision to save the life of such a colony. As in all my experience, however, I never had a queen become fertilized at the age she would be when her own drones were able to fly, I gave it up. It may be, however, that under some circumstances it might be possible. Of course, there would be the objection of breeding from a near relative; but nature may have decided such a course to be better than utter extinction. Can anybody else tell us more about it? We have for some years adopted the plan of smoking the bees all into the hives when moving them in our neighborhood. I have seen colonies live for some time under the hive, just as you describe; and I have no doubt but that they would winter all right. In fact, the idea was advanced, many years ago, that if

hives were made with no bottoms except the ground, they would never be troubled with the moth miller. Now, it was to prevent this very catastrophe that I decided to have the bottom of the Simplicity hive the same as the cover. When banked up with sand and sawdust, as I have described in the A B C, it not only absolutely prevents the queen or bees from crawling under the hive when you are extracting, but it prevents toads, spiders, and snakes, and all such enemies, from getting under. Our first stands for bee-hives were made of a wide board with a piece of scantling under the back and front; but when we used these stands, during extracting time I used to go around every night and poke out the bees that had crawled under the hives and there clustered. If I wanted hives as high as you have them, I would set each one on a box, or, perhaps, something like an empty hive without top or bottom. I think bees can build comb to advantage in the open air, only when the weather is mild and the cluster of bees large. With our old hoop hive we demonstrated pretty well the effect of thin well-ventilated hives. Although the bees will get along in them, we think it is not profitable.

REPORT FROM FLORIDA.

25 LBS. PER COLONY FROM ORANGE-BLOSSOMS.

MR. ROOT:—I see by May 1st GLEANINGS that you are somewhat surprised at the yield of honey from the orange-blossoms in Florida, as stated by J. B. LaMontagne, pages 355, 356. It is as friend LaMontagne says. You would be surprised to see how many bees are at work on some of the large trees at one time; and the honey, as he says, is very white and of a fine flavor. I for one do not wish for any nicer. My bees this year have gathered on an average 25 lbs. per colony from this source alone. The best colony gave 48 lbs., all in $4\frac{1}{4} \times 4\frac{1}{4}$ sections. The above honey was all gathered inside of two weeks. Bees did not work on it the first three weeks, on account of unfavorable weather. You ask if it is only in a favorable season that they work this way. I think not, as my average last year was 35 lbs. per colony from this source. I have only a few bees, 16 colonies, at present, which may account for such a fair average from this one source. My total average this year up to date is 42 lbs. per colony (spring count), with gallberry and saw-palmeto to hear from yet, both of which are just opening; bees will be at work on them in a week or ten days. We generally get a good surplus from both of these sources.

The large green dragon-flies have been very troublesome about the apiary the past three weeks. They come by the hundreds, and destroy a great many bees. They are so bad at some times that the bees stop work altogether while they are around. I have seen them dart right down to the entrance of the hives and get a bee, when there would be a pint or a quart lying out on the front of the hive. I call this pretty bold.

A. F. BROWN.

Huntington, Fla., May 15, 1889.

We are very glad to get so good a report from the orange. I think if I were you I would try to trap or poison those dragon-

flies. It may be difficult to poison them without poisoning the bees, but I think it can be managed. I suppose your locality is near large bodies of water.

MOVING BEES TO ANOTHER LOCATION IN THE SAME NEIGHBORHOOD.

HOW TO DO IT, AND HAVE THE BEES STICK TO THEIR HIVE.

EDITOR GLEANINGS:—On page 347 friend Miller has an article on moving bees; but it seems to me that both he in his article and you in your foot-notes have overlooked one of the most important factors in the problem of how to move bees to a different location with the least loss of returning bees. I refer to the fact, that the more thoroughly bees, while being moved, are shaken up, roughly used, confused, or "obfuscated," as the darkey calls it, the more inclined they will be to mark their new location. The more thoroughly they can be impressed with the knowledge that something terrible is happening with their home, the more thoroughly will they examine the question of a new home when allowed to fly. Bees that have been carried two miles in a buggy or wagon, have of course been jolted more than if carried only one mile, and more of them will mark their new location. This whole thing can be tested by removing some colonies during the honey season half a mile or a mile from home, then carrying others several miles away and returning them to the same locations the first ones were taken to, without having allowed them to fly; then observe whether those that have been jolted the most and furthest will mark their new location the best or not. All such experiments should be made during a honey-flow, as bees are much more apt to pitch headlong out of their hives at such a time than at other times. If I am correct in these views, then it follows that your and friend Miller's deduction (that the fact that bees that have been moved two miles rarely go back, shows that bees rarely fly so far when foraging) is not so fully proven as you seem to think it is. My own observations have caused me to have quite a decided opinion that bees, especially Italians, frequently range freely at least four or five miles away from their home.

There is another practical application to this idea when making nuclei. Instead of carefully lifting the combs with adhering bees into the nucleus hive, I practice shaking the bees off the combs into the new hive, while placing the combs in the hive, closing hive up quickly before many take wing, and find that nuclei thus made retain many more of their bees than if the operation of shaking bees off the combs were omitted. Your apiarist is probably making many nuclei this season, and you can easily have him thoroughly test the value of this method, and report.

O. O. POPPLETON.

Havana, Cuba, May 21, 1889.

Your suggestion is a good one, friend P.; and I confess it never occurred to me before, that the further they are moved, the more likely they would be to take their points before sallying out. We have already tried pretty thoroughly this matter of shaking bees up and pounding on the hive to make them fill themselves with honey, and in order to make them hold to their

location after their hive was moved. But with some colonies, especially full-blooded Italians, it did not seem to make very much difference. They would go back to their old home, and cluster on a bush, even after they had been carried back to their hive repeatedly. We have always taken combs, bees and all, quietly from the hive, when we wanted them to form nuclei. If unsealed brood is carried with them, a great part of them will be pretty sure to stay; in fact, almost every bee will go home unless unsealed brood, or, better still, a queen, is carried with them. By taking the old queen from the hive, and leaving her a couple of days, most of the bees will usually stay with her. Friend Doolittle described this plan a little time ago.

WHITE ANTS.

ALSO SOMETHING ABOUT INSECTS RESEMBLING IN THEIR HABITS WHITE ANTS.

A FEW days ago I received a letter from J. F. B., Columbus, Ohio, in which he stated that some black insects, looking like ants, annoyed him seriously each spring. They came from the floor of his office, which was laid on sleepers between which he had packed coal ashes before the floor was laid. The insects would fly to the windows, upon which he had killed scores of them. Some of them were sent, and proved to be males and females of *Termes flavipes*, or white ants, which are among the most interesting insects we have in our country.

I have just received the following from Henry Wilson, Clinton, Ill.:

I send you some white insects, which are very common here, and very destructive to almost all kinds of wood. I have known them to attack the sills under buildings, and to destroy fence-posts; indeed, any wood that is connected with the ground. I send two kinds. I suppose the one with wings is a sort of queen. Please tell us through GLEANINGS what these are, and what can be done to destroy them.

FIG. 1.—FEMALE WHITE ANT.

Though these are called white ants, they are not ants at all; though in their general appearance, and in their life habits, they remind us not a little of true ants. These insects are lace-wings, and so are related to ant-lions, dragon-flies, etc. White ants are very common, and terribly destructive in the tropics. The one here figured (Fig. 1) is from India. This great vital egg-sack is utterly powerless to care for herself. She is said to lay 100,000 eggs daily. The drawing is natural size. The worker-ants not only feed her digested food, but carry off the eggs, and I suppose occasionally turn her over and scratch her back. These tropical ants raise great mounds, and are said to entirely devour wooden houses and furniture, except a thin outside shell. Thus a person sits down to a table or on a chair, which looks all right, but which, like the "deacon's one-hoss shay," sinks to nothingness when touched. Humboldt said that a library was impossible in many tropical countries because of

these terrible miners. In other words, these ants love books—they are "book-worms." In all white ants the differentiation of individuals is far greater than among bees. Thus there are both male and female workers. The workers are simply abortive, or partially developed males or females, as the case may be. Then there are big-headed forms—the soldiers. Like the workers, the soldiers are also both male and female, and also undeveloped. Fig. 2 shows a soldier of *T. flavipes*, magnified four times.

FIG. 2.—A SOLDIER WHITE ANT.

The males and females of *T. flavipes* are black or very dark colored. They possess wings, are one-fifth of an inch long, and expand more than half an inch. They come forth from their tunnels in spring, often in swarms, settle to the earth, when the males seize the females. Some think, however, that mating does not occur till later in the season. After their flight they shed their wings.

This American white ant—the workers are small and white—also likes books at times. It has seriously injured public documents in the State Library at Springfield, Ill. It has shown the same habit, I believe, at Harvard College, where it is the fashion to go through books.

A few years ago the manufactory of Alvin Clark, the celebrated telescope-maker, at Cambridge, Mass., was attacked by this same white ant, and the first story had to be replaced to prevent a grand crash. Some years since, I received some of these same termites from a greenhouse man in Grand Rapids, Mich. The greenhouse was an old rotten wooden structure, and the ants not only attacked the building but also the roots of the potted plants.

The remedies are not hard to find. Kerosene oil, gasoline, bisulphide of carbon, and boiling hot water, will each and all put a quick end to the existence of these pests, if turned upon them. Circumstances will guide us as to the best specific. In case gasoline or bisulphide of carbon is used, great care must be exercised to keep all fire away till the vapors are all gone, or there will be a grand explosion. In case the ants are beneath the floor, as at Columbus, the floor might be taken up, the sills and all beneath saturated with kerosene oil, and the floor relaid. This would surely destroy the ants, and I do not think the oil would be disagreeable, with a well-laid matched floor above. Each person must decide as to which is the most desirable remedy in his special case.

In case of the greenhouse, I recommended pouring hot water on to the earth about the roots of the plants, and the painting of the woodwork with kerosene oil. The advice was followed, and the enemy at once disappeared. A. J. COOK.

Agricultural College, Mich.

I am greatly surprised to learn that we have insects in Ohio that destroy furniture in the way you describe. I have read of them in the tropics; but I supposed we were never to be troubled in that way. Saturating the woodwork with kerosene would add sufficiently to its durability, probably, to pay for all the cost of the application,

A NON-SWARMING RACE OF BEES.

WOULD THEY BE HONEY-GATHERERS AS WELL AS NON-SWARMERS?

IS it possible, from a practical standpoint, to produce a strain of non-swarming bees? If so, will they not be indifferent honey-gatherers, and lack the vitality necessary to be the bees wanted by the practical apiarist? "Why do bees swarm?" has been fully answered, and we infer that one prime cause is an overabundance of bees with a prolific queen, both in connection with a bountiful honey-flow. Very likely by producing queens for several generations from stock of limited laying qualities, we may be able to produce a strain of bees that will not swarm, and for very obvious reasons. We have queens in our own apiary that are four years old, and yet they have not swarmed, even under what might be called favorable circumstances. These bees always winter well, and breed up early enough in the spring; but when the honey harvest comes we find they are non-honey-gatherers as well as non-swarmers; this leads us to almost conclude that non-swarming queens are of but little use to any one; the only reason we can give for this non-swarming is that they lack the necessary ambition. The queens we like are those that keep their hive overrunning with bees, and when honey comes in they will want to swarm, non-swarming or not. There is certainly no queen worthy of being kept in a colony if she is not prolific enough to keep the hive overflowing with bees under favorable circumstances, and if such is the case then non-swarming is more the result of poor layers than a predisposition not to swarm. We don't say there is no such thing as non-swarming bees, for we have got them in our own yard; and our opinion, as before stated, is that the reason for it is a lack of ambition. Perhaps friend Boardman will say the reason for their not swarming is because they are perfectly contented; and if he is right, then we want to say we have more contented bees than we want. We look upon non-swarming bees about as we do on a non-swarming hive with patent moth-trap attachment; and if we put non-swarming bees and queens in such a hive, we have the *ultima* thule of worthlessness. If such would not be the result, we will give one of our non-swarmers to know why. Then, again, will not a queen be more liable to swarm in one locality than in another; if so, then of what moment is a strain of non-swarming bees? There is not the least doubt but that a strain of non-swarming bees would be a bonanza to thousands, providing they were as hardy and prolific as the best strains of Italians, or even hybrids; but in our humble opinion, such a point has not yet been reached; but far be it from us to say that it will not be reached in the future, for it may be possible; but if there are any non-swarming bees that are as hardy and prolific, and as able to send out the field-force of some of our best Italian colonies, we want to see them, and we want to see them pretty bad. Our experience says there are none; but as we don't know it all, we are willing to be convinced just the same, as we are willing to be convinced that there is a better general-purpose bee than the pure Italians. M. W. SHEPHERD.

Rochester, Ohio, May 27, 1889.

I do not think it necessarily follows that the bees would be poor honey-gatherers, because they did not swarm. Some of the

largest results we have known came from hives where the bees right straight along through the season sent a large force of workers to the fields every day, without getting the swarming fever at all. Will the rest of our readers keep this matter in mind? Have you not, most of you, colonies that gather large yields, and do not swarm at all?

RAMBLE NO. 17.

"IT IS PAID FOR;" COMING OUT OF THE LITTLE END OF THE HORN, ETC.

A FEW years ago a rap came to the Rambler's door; and upon answering it, there stood a very large man with his back toward the door, busily sharpening a lead-pencil. Without taking his eyes from the interesting point of the pencil, or looking to see who was opening the door behind him, he asked if Mr. Rambler was at home. He was answered in the affirmative, and was told that his humble servant was the man he was after. The pencil was silently finished to his satisfaction, and not until then did he make his business known. He introduced himself as Mr. Stephen Carpenter, of Granville, N. Y. Said he, "I am a bee-man and thou art another. I desire to see thy bees." We immediately adjourned to the apiary, and I found my Quaker friend to be an interesting visitor.

MY BIG QUAKER FRIEND AND I.

This episode happened several years ago; and since then the Rambler has made many calls on friend Stephen and his wife, and has always found a warm welcome. Mr. C. is now nearly 80 years of age; weighs, when in full health, 315 lbs., and his wife weighs about 100. Mr. C. has ever been a local celebrity for thrift, as all Quakers are. He is also noted for his great strength. A few years since, an article appeared in the *Troy Times*, describing some of his wonderful feats of strength, such as lifting a 1400-lb. cannon; throwing a troublesome steer over the barnyard fence, and taking two insolent men, one under each arm, and tossing them outdoors. These feats Mr. C. is very modest about mentioning. He never thres, however, in talking about his house and grounds. The house was built a few years since under his own supervision; and as we pass around in our inspection, his cane comes down in a pronounced manner, and with the whack come the words, "It's paid for!" We enter a

splendid cellar, the floor flagged evenly with large stones from the extensive slate quarries near by. The cane comes down on the floor, "It's paid for!" A large cistern across one side of the cellar, also covered with large flat stones, receives another whack—"It's paid for!" We go upstairs; every thing is substantial, neat as wax, and "paid for." Although Mr. C. and his wife can not play on a musical instrument, a costly piano graces the parlor, and his hand comes down upon the keys—"It's paid for!" So with the carriage, the horse, and the woodpile—"It's paid for."

Mr. and Mrs. C.'s pride, though they are so far advanced in years, seems to run to the raising of nearly all the garden luxuries of the season. Early and late potatoes, fine strawberries, fruits of all kinds, and last but not least, honey. Mr. C. has kept bees for many years, having them in old box hives; and, getting but little profit from them, they were transferred to movable-frame hives. His cellar has proved a fine repository for wintering, and is the first one the Rambler ever saw where bees were wintered near a large cistern. Though the body of water is covered with a mouse-proof covering, there must be more or less humidity in the air of the cellar; mold does not collect upon any article. The bees keep very quiet, and usually come out in excellent condition; and if there is any loss it is from starvation or weakness when put in.

Mr. C. is very particular to place the hives up a good distance from the floor. Nothing but flour-barrels with boards placed across them will be satisfactory to him. His apiary runs up to about 50 colonies; and finding good sale for his strained honey, an extractor was purchased, help obtained, and several barrels were filled with the nectar. The owner was much elated; and as every thing was "paid for," the dollars that came in from the sales jingled merrily in his pocket.

BIG AND LITTLE END OF THE HORN IN BEE CULTURE.

The bees were carefully put in the cellar in the fall; but it was observed that the hives were not so heavy as when box honey was raised. When spring came, and the bees were put out, a greater portion of them were dead, starved to death. This was a lamentable affair, and Mr. C. characterized the operation as going into the big end of the horn one year and coming out at the little end the next year. And this is not only the experience of our Quaker friend, but of many others, among whom may be found the

RAMBLER.

Friend R., we are very sorry to know that your big friend came out at the little end when he got to using the extractor; but, judging from the picture, even the little end of the horn must have been of pretty good size. There is quite a moral that may be gathered from that little sentence, "It is paid for." I know full well of the satisfaction and pleasant feeling it gives one to be able to say when he has succeeded in getting some work done to his notion, "It is paid for;" and I am afraid a good many of the friends who read GLEANINGS lose a great part of the enjoyment that God has prepared for us, simply because they go through life with an uneasy and guilty feeling of owning property, and using it, perhaps, day after day, without its being "paid for."

DOUBLE BEE-STANDS.

R. F. HOLTERMANN OBJECTS TO THEM.

YOU will perhaps remember, that at our convention in Columbus, Ohio, last autumn, I objected to bee-stands being close together in pairs. Perhaps the objection is not a very strong one, as it consists only of this: When a colony is made queenless on one stand it will shortly after load up with honey and unite itself with its neighbor, they forming a long and unbroken line into the next hive, if the stands touch one another. Herein, perhaps, the bee shows greater wisdom than man; for many queenless colonies would perhaps be better united with one having a queen than bolstered up; yet when other aims are in view this trait is objectionable, and a little greater distance will easily prevent the difficulty. When, however, it comes to attaching the two stands, I would say, most emphatically, no. Perhaps such careful men as Dr. Miller, with years of extensive experience, may be able to manipulate the one hive without jarring and irritating the bees on the other; but how many bee-keepers have not the capital that Dr. Miller has, and would get the second colony in a very undesirable frame of mind for handling. For this reason I think it objectionable that the general bee-keeper should have a double stand in the apiary.

SECTIONS WRONG SIDE OUT, ETC.

It does appear extraordinary, when we think of the simple facts required to be communicated to some bee-keepers. The other day, in my travels through the country I came across a bee-keeper who was taking comb honey. The sections were folded wrong side in, or wrong side out, whichever way you prefer, and then the bee-spaces were turned the wrong way, to the side instead of top and bottom. I begged for that crate, and told them I was anxious to exhibit it at the Toronto Industrial Exhibition, but I could not get it. But does it not show us we are neglecting many simple facts in bee-journals? The individual I speak of had for years taken one or more journals at a time. The comb-honey venture is a comparatively new one.

Brantford, Can.

R. F. HOLTERMANN.

I decided years ago, just as you have done, that I never wanted two hives attached together any more. I want each one on a separate stand, and so arranged that I can at any time walk clear around it.

CENTIPEDES.

THEIR BITE, AND THE USE THE CHINESE MAKE OF THEIR POISON.

ONE can not take up an ordinary paper or magazine, and surrender his mind to it enough for healthy recreation, without having his spiritual tone depressed; but in GLEANINGS I find recreation that tones up instead of down. This comes of its treating secular matters in a Christian spirit. A remark which a Chinese Christian once made to me illustrates the difference between a Christian and a heathen spirit. He said, "You are always ready to impart information. With us Chinese, what we know we keep to ourselves; and if we are ignorant, we do not like to ask others for information; for the one we ask would not inform us correctly, but would only glory over us because he knew more than we did."

But I started in to recreate on centipedes. These hardly ever trouble us in our ordinary residences; but at our seaside sanatorium, where many of us have to spend two or three of the hottest months, they are quite an annoyance. In this semi-tropical climate the centipede usually grows to be a little longer and two-thirds as broad as one's middle finger; but it is a very flat creature, and a very strong one too. I once put almost my whole weight on one, under the sole of my shoe; but when I took up my foot it started off as lively as ever; and I once saw a small one dragging off a gecko, many times heavier than itself. Its body is made up of 21 segments, each of which has a pair of legs. How it manages so many when running, I do not see; but Dr. Whitney, who has dissected one, says that its nervous system is very interesting. Each segment has a nerve-center with a pair of white nerves running down into its pair of legs, while a central cord connects all the segments with each other. Just back of the head is a narrow segment, from the under side of which grows a pair of nippers. These are three-jointed. The last joint ends in a sharp black point, while the first one expands into a poison-bag. With us their bite is not dangerous, but sometimes it is very painful. Much depends on the person, the spot bitten, and the condition of the centipede when he bites. In India, where they grow to be a foot long, their nip may be really dangerous. They are timid, and swift of foot, and live in cracks and crevices. They have a habit of crawling about under cover, and hence they like to get under the bed clothes; and when they happen to get on to a person, they prefer the inside of his clothes to the outside. One curious fact about them is that they generally appear in pairs, which seem to be attached to each other.

Several years ago I happened to be awake one summer night, and heard our little daughter whimper in her sleep, saying, "That shell on my ear!" Pretty soon she began to cry, and on looking we found the marks of a centipede's nippers behind her right ear. Fortunately it was not a severe bite. But one morning, as Dr. Whitney was wiping his face, a centipede, hidden in the towel, nipped him about an inch and a half below his left eye. He suffered severe pain for over 24 hours, and the place bitten was red and tender for weeks afterward. The dead centipede was pinned up on the wall, and next morning its mate was found near by it.

One morning last summer I suddenly discovered

a centipede under the breast of my coat. I jerked the coat off in a hurry, and began slapping at the hideous thing, which wriggled around over me so fast that I missed it several times. At last I knocked it off on to the floor behind me, and it dodged down some crack so quickly that I never saw it again. Had I succeeded in killing it its mate would have hung around until it too was killed. But when it escaped with its life, and had informed its mate of its adventure, perhaps the pair agreed with each other never again to go near a *biped*. Chickens will kill centipedes, and the Chinese say that "centipedes fear chickens, chickens fear snakes, and snakes fear centipedes."

The Chinese use the centipede for medicine, on the principle that one poison will combat another. When a centipede has been killed they take a bamboo splinter of suitable length, sharpen the ends and stick the points through the head and tail, and dry the worm stretched to its utmost length. Just now wishing one to examine, I bought one at a drug store for a cent and a half, which, as thus stretched, is 9 inches long—a monster for these parts.

TIGER-HEAD HORNETS, AND THEIR VINDICTIVE TEMPER.

Once four missionaries, an Englishman, a Scotchman, a Yankee, and myself, were on our way to take a look at a famous Buddhist monastery on the side of a mountain. We were walking up hill with our Coolies and sedan-chairs following behind us, when we spied a large hornets'-nest hanging from a small pine, about 50 feet from the road. The hornets were about twice as big as any I ever saw in America, and the Chinese called them "tiger-head hornets." The Englishman proposed that we knock the nest down, while I advised them to let it alone; but he began to look for stones, and the Scotchman began to throw them. I started on. A stone struck the tree, and immediately two or three hornets came over to inspect us. I quickened my steps; but the next stone hit the nest, and the hornets came at the thrower as straight as a shot from a gun. We all started to run up hill; and our Coolies, half naked, seeing us running, came running after us, right into the midst of the angry hornets. The Englishman, who was the prime mover, did not get a single sting. I had a slight one, the Yankee two severe ones. The Coolies also were stung, and they said, "There is no heaven's justice in this; we did nothing, and yet we got stung." But the Scotchman was stung in six places, and was in fearful pain for an hour or so. There was one while that he fairly quivered from head to foot, like one in an ague fit. The Chinese said it was a rash thing to attack a nest of tiger-head hornets. They had been known to sting a man to death. I asked the Scotchman what he thought of the promise to send hornets before the children of Israel. He replied, that he thought the plan might have been quite an effective one.

J. E. WALKER.

Shao-wu, China, Jan. 26, 1889.

Thanks, friend W., for setting us right on the centipede matter. Now, is there really any virtue in these dry centipedes, kept for sale at the Chinese drug-stores? Does the poison have any such medical property as the poison of the bee-stings? If so, why don't the doctors simply save the contents of the poison-bag, and not have a great horrid-looking worm to be handled and given store room? The tiger-head hornets you

speak of are probably something after the fashion of the *Apis dorsata*. I have seen our own hornets fly from their nests just as you state, as straight and almost as swift as a shot from a gun. Why in the world didn't some of you caution the Coolies, instead of letting them get stung in that way, when they were entirely innocent? I should not have blamed them if they had turned around and commenced stoning the whole of you white people—missionaries and all. We should like to see one of those big hornets, preserved in alcohol.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

WHY DO LAYING QUEENS DESERT THEIR HIVES SOMETIMES, AND ENTER OTHERS?

I AM sorry to inform you that I lost that nice Italian queen you sent me last summer. I had just got her a good colony built up in five weeks from the time I got her, and she left her hive and I found her one morning on the alighting-board of another hive, on the opposite side of my yard, with a lot of bees balled up on her, about the size of a walnut, and they had killed her before I found it out. I can't tell what possessed her to leave her hive and go to another. I had her in a hive that was painted white, and the one I found her on was a marble-colored hive. I took what eggs she had and gave them to some queenless hives, and got several queens; but none ever produced as yellow, nice Italians as she did. She never laid a drone egg while she stayed with me, and of course the queens I got from her had to meet the drones from my other bees, which were not very good Italians. I want to get another queen of you after a while, and try my luck again.

McDaniels, Ky., May 21, 1889.

J. H. HART.

I am aware that queens apparently in a normal condition do sometimes get out of their own hives, and go into an adjoining one, or into some other hive in the apiary; but I have never been able to give any explanation of it, more than that the colony had swarmed some time when no one was around; and the queen, not being able to follow the bees, on account of a clipped wing, or for some other cause, had crawled along the ground, entered another hive, and succeeded in displacing the reigning inmate. If your queen's wing was clipped, this might be the explanation.

JAPANESE BUCKWHEAT SUPERIOR TO THE COMMON FOR HONEY.

I got one pound of Japanese buckwheat from you in the spring of 1888. I sowed it on new land full of roots, as I just took the timber off. I got over 3½ bushels of seed, much nicer and plumper than that I got from you. I had a few stalks of the old variety; and while the heads felt like chaff, the Japanese was loaded with grain. I think this will take the lead, and all others will go to the wall. I agree with Prof. Cook as to its being a honey-producer, for the bees worked on it all day, while they left the other before noon. The great trouble with buckwheat in this latitude, 44½°, is, if put in early,

the hot weather will blast it; if put in later, early frost will catch it. But with the Japanese, both are obviated. I prepare my ground as I would for oats, and sow not more than a peck to an acre. You will get more grain from that amount, on an acre, than any larger amount. Try it as I have, and be convinced.

L. P. COUSINS.

New London, Wis., May 27, 1889.

WHO IS THE RIGHTFUL OWNER OF THE SWARM?

I should like your opinion as to the rightful ownership of a swarm of bees. I have 33 colonies of bees, probably three times as many as the whole neighborhood within a range of three miles. One of my neighbors found a swarm on my place, about half a mile from my bees, on an apple-tree, and came to me to get a hive and borrow my bee-veil and smoker. Now, in all probability the bees were mine, and to say the least I thought it looked a little cheeky. Now, who was the rightful owner—the man who found them or the man whose place they were found on?

G. F. STEEVES.

Panama, Neb., May 11, 1889.

As you state it, the bees are yours, without question. The old clause in our laws that applied to bees found in a forest would not apply to a swarm of bees found in one of your own apple-trees on your own premises. Any justice or any jury in the land would decide the matter in this way, without any question.

THE GOLDEN BEE-HIVE, AGAIN.

The "Golden" bee-hive, shown up by GLEANINGS a few years since, has made its appearance in our midst, sold by one Pickerl's. Has the fellow a patent on this hive or not? None of our intelligent bee-men buy said hive, but find voluminous objections thereto. Ten dollars for *family right* is the small tax he requires, and some pay it. Amite Co., Mississippi, paid about \$1500 for its use.

W. F. ROBERTS, M. D.

Clinton, La., May 21, 1889.

It is not worth while to inquire whether there is a patent on the Golden bee-hive or not. It has been reported as a humbug and swindle for ten or fifteen years past, and every one who hears of it should take pains to post people in reference to it. The operations of those who have it in hand are fully given in our back volumes. You had better let patent hives alone entirely. I think every intelligent honey-producer at the present day will second this advice. See extract from Dadant's new book, on the first page of editorial matter in last issue.

FEEDING IN SPRING, ETC.

1. What is best to feed in spring to stimulate brood-rearing?

2. How much should be fed each night?

3. Will such feeding pay?

4. Do you think honey-boards or separators are any hindrance to the bees?

LESTER JUDSON.

East Sidney, N. Y.

1. The best feed to give the bees in the spring, for stimulating, is granulated-sugar syrup; but from motives of economy it is better to give them combs containing old or dark honey, or if you have some old extracted that is not salable. First heat it, to make sure that you kill all germs, and then

feed it back to the bees. During the spring you can give the bees almost any thing they will take. A great deal of old surplus, or sweets of any kind, can be used to good advantage. 2. We would advise you to feed about a pound daily until they are supplied. 3. If you wish to produce comb or extracted honey, or even to sell bees by the pound, such stimulative feeding will pay, provided the natural sources fail. 4. Our best authorities agree that honey-boards and tin separators are no hindrance to the bees. If they are a hindrance, certainly no one is able to observe it to any appreciable extent.

MOVING BEES UNDER RISKY CIRCUMSTANCES.

I had 20 hives moved 3 miles on a warm day, the 24th inst., and there was scarcely a hive from which bees could not crawl out at poorly fastened entrances or warped corners. Bees were flying when each load arrived home. Horses were not stung that we know of, and the bees did not sting me. I used a veil for only a few minutes. I was scared when the first load arrived, but found no harm was done. I was not alone. G. F. AYRES.

Atherton, Ind., May 22, 1889.

It is almost a wonder that you succeeded as well as you did, under the circumstances. We would not advise you to try the experiment again, if you value your horse and wagon.

ABSCONDING AND COMING BACK.

On Sunday, May 5, I had a very large colony of hybrids, two-thirds Italians, swarm. There was no one at home at the time to hive them, I being at church. They hung on a limb for over two hours, and finally went away. They stayed away for three days, when, lo and behold! on Wednesday they came back and clustered on the next tree. Having nothing prepared at the time, I took a band-box, cut some holes in it, and put it on a pole about 2 feet long, and got them down into the old hive. Then I put a piece of perforated zinc in front to keep the queen in. In another day or two they came out and clustered on a vine near by; but the queen not being able to get out also, they soon went back. I then went to work and divided them. I know that these bees must be mine, because no one else has any Italian bees around here. Please let me know if you have any bees that cut up such capers. J. C. HERBENER.

Portsmouth, Va., May 18, 1889.

Thanks, friend H. I have heard of swarms going off and coming back again. They probably discovered, after they had commenced housekeeping, that their move was rather premature; and rather than starve to death they wisely decided to go back and stay a while longer in the old hive.

THE HONEY CROP FOR CALIFORNIA AN ENTIRE FAILURE.

The honey crop of California will be nearly an entire failure this season, owing to those two dry months during January and February. We have also had too much cool, unfavorable weather. I visited friend Wilkin on the 25th. His bees are in fine condition, but not much honey gathered. Rather discouraging, but we are getting accustomed to bad seasons. Our good seasons repay considerably for losses. M. H. MENDLESON.

Ventura, Cal., May 27, 1889.

"BOOMING."

Bees are booming here now, and we are having lots of fun hiving them. The clovers are just coming nicely into bloom, to keep raspberries and locusts company, which I never saw before—the tree in bloom at one time. Clover is fully ten days earlier than last year, and it bids fair to give us a fine lot of honey. Sumac and basswood are well budded, and promise well. Oh how different from last year! A. E. MANUM.

Bristol, Vt.

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 130.—What special means, if any, do you use to get the bees to work on sections?

None.

A. B. MASON.

Fill them with foundation. MRS. L. HARRISON.

Plenty of bees and honey seem to be necessary.

P. H. ELWOOD.

I have no trouble to get them to work when they are in proper condition to do so. GEO. GRIMM.

Put a few sections into the super that has comb in it. E. FRANCE.

Put in the center of the first super a section which has had honey in it before. C. C. MILLER.

Get all the brood-frames as close together as possible, so as to leave just enough space for the bees between each comb. PAUL L. VIALLO.

a. Contract; b. Reverse frames; c. Put comb in sections; d. Put little drone brood in sections. I do not use the same now. A. J. COOK.

Get the combs below filled with brood; then when the honey comes, the bees must take it to the sections, as they have nowhere else to put it.

G. M. DOOLITTLE.

If the colonies are populous, and each section is properly filled with foundation, they will usually occupy the sections if the flow of honey is good.

L. C. ROOT.

With large hives full of worker combs, and prolific queens, after a good wintering and an early breeding, we have never seen bees refusing to work in the surplus apartment if a few combs are placed in it.

DADANT & SON.

There are no other means to make bees work in the surplus boxes than a flow of honey, and the fact that the brood-chamber is about filled. A piece of comb or foundation, from top to bottom, in each one of the section boxes, serving the bees as a ladder to run up on, is an inducement. C. F. MUTH.

I get the brood-chamber full of bees and brood by the beginning of the honey-flow. That is all that is necessary. I rather prefer, though, to have the first honey gathered stored in a set of extracting-combs. Some bees will begin to work more readily on empty combs, and they work to better advantage on them when honey is coming in slowly. I would not use these, though, if the honey-season began with a rush. JAMES A. GREEN.

There is something about this question that is to me very suggestive. The bees are more reasonable in this matter than some apiarists seem to be. They will not store their honey up in a garret so long as they can take better care of it downstairs. When the conditions are favorable, and honey is plentiful, they will take possession of the surplus apartment, and you can't keep them out, even if you should try. If you think you can, try it some time and report your success.

H. R. BOARDMAN.

I do not keep bees that need special measures to make them put honey in the sections, when there is any to put there. If I kept such, possibly I might insert a chunk of young brood in one of the sections. As for putting on half a dozen sections, bees and all, from a better colony, I don't believe I should do that. My sections of empty comb left from last year I divide up among the different colonies, and put them in the center, directly over the brood. This is to some extent an inducement to go above.

E. E. HASTY.

This question seems a queer one to me, and, answered from my standpoint, my answer may seem strange to you. My bees never falter in entering the surplus apartments, at storing time, for either comb or extracted honey, the moment the flow furnishes any surplus, provided, of course, the colonies are of normal strength. Now, you may put your question to me again, to know what means I have used to bring about this condition of affairs, which does not seem to exist in every apiary, I take it, from your question and others similar. In the first place, I carefully breed my bees for honey-gathering and comb-building qualities or propensities. I study the shape, size, and manipulation of my brood-chamber in connection with this important feature; also the surplus apartment to some extent.

JAMES HEDDON.

It seems to me that friend Heddon and some others rather ignore the need of getting bees to commence work promptly. I have seen a colony cluster on the outside of the hive when honey was coming in at its best. An examination of the combs showed that they did not gather a pound a day, while other colonies not as strong would gather six or eight pounds a day; and this same colony that had been thus wasting its time, when they once got started would store eight or ten pounds in 24 hours. When bees get the swarming mania they are quite apt to act in this way, and a swarm will sometimes persist in hanging idly outside and sometimes inside of the hive, instead of going to work. I have made such commence business by driving them into the hive with a smoker—at least, they commenced after being well smoked, and I suppose that smoking gave them the hint. Where a newly hived swarm departs itself in this matter, it is pretty evident that they are dissatisfied—may be because they had picked out a tree, and were bound to go to the tree instead of staying where they were. A new swarm that does not go to work is very apt to turn up missing some time during the day. Now, I am not sure that I can prove it conclusively, but I am pretty well satisfied that a frame of brood is quite an inducement for such a swarm to go inside and commence comb-building. When you

get them under way, of course they will go to work in surplus boxes or anywhere else.

QUESTION 131.—a. In tiering up supers, should the empty one be put under or over the one partly full? b. If you practice both ways, tell when you put under and when over.

Over.

O. O. POPPLETON.

Under.

A. B. MASON.

Under.

MRS. L. HARRISON.

Under.

P. H. ELWOOD.

Put the empty ones over.

L. C. ROOT.

I have always put it under. I do not know that it is always wise to do so. It works well with me.

A. J. COOK.

I have practiced both ways. All things considered, I prefer placing the empty ones on top, every time.

H. R. BOARDMAN.

I always put the empty ones below the partly filled; but before adding I get the first case at least three-fourths full.

P. L. VIALLO.

I do not practice tiering up, believing that there is a better way. As usually done, the empty super is put under the other, when the first is full.

G. M. DOOLITTLE.

Bees work downward, as a rule. Empty supers should always be put under supers which are almost finished, and not until they are almost finished. Otherwise the upper super will remain unfinished longer than is desirable.

C. F. MUTH.

a. Sometimes under, sometimes over. b. In a heavy yield I put the second under; and, in general, so long as I am almost sure all will be filled. If I am not sure more are needed or will be filled, or in general toward the close of the honey-flow, I put the empty one on top.

C. C. MILLER.

Under, by all means. If you think it unlikely that another super will be completed, you might put the empty one on top; but in that case I would much rather use a set of extracting combs. This method saves all the honey, and avoids the expensive nuisance of a lot of unfinished sections.

JAMES A. GREEN.

We nearly always put the empty super under the one partly full. If the honey in the super is mostly sealed over it should be raised, and the second put under it; but if the super is only partly filled, and another has to be given, owing to a very large yield, the second one may be put on top; but the other way is the better one.

DADANT & SON.

When I have a super from half to three-fourths filled I put an empty super under, if I expect the honey-flow to last a few days longer. But, as in the case of the basswood harvest being nearly over, then don't disturb the super that is partly filled; let them finish that. One super well filled is worth more than two partly full.

E. FRANCE.

I use mostly wide frames holding two courses of sections, and they never need tiering up to carry the crops gathered here. If I used crates, and wanted to put on a second one, I should put it over. I have confidence in my bees that they would go up if it were best to do so. Whereas, if I put their half-finished work up stairs, the danger of its being left unfinished until they began to carry the honey down would be too great.

E. E. HASTY.

a. The empty ones should be put over, and should be put on before the lower ones are ready to seal, except at the very close of the season, when great care should be taken not to add sections until the others are sufficiently filled to insure their being sealed, even if the season should suddenly close. I used to put the empty ones under the others, but found that I often got left with a great many unfinished sections on my hands—an evil which I now almost entirely avoid.

GEO. GRIMM.

As a rule, the partially filled one should be raised up and the empty one placed in under. There are several reasons for this. Prominent among them is the fact that the bees are not as apt to soil some of the combs before all of them are finished. I advise as above. Remember, that in this feature of our business every thing is against us in the fact that, as the room decreases, the colony increases. It is like two men going toward each other. They meet almost before they know it.

JAMES HEDDON.

It has been so much my habit to put the case of empty sections under the full one, that I have hardly tried any other plan, although it is true I have often had just the result mentioned by several above; i. e., a great lot of sections with a little start, and may be a little honey in a good many of them.

QUESTION 132.—*I have a number of combs every spring (from dead colonies) that I wish to keep clear of moths and worms till they can be used at swarming time. What is the best way to manage them?*

Put them into a tight room, and brimstone them occasionally.

P. H. ELWOOD.

I have always saved mine by inserting them in strong colonies.

O. O. POPPLETON.

Put them into a perfectly close box, early in spring.

A. J. COOK.

Leave them where they will freeze during the winter, and you will have no difficulty in keeping them until swarming time.

H. R. BOARDMAN.

Here it is one of the hardest things to do. The best way is to put them on top of strong colonies. This refers to this part of the country, where our bees need no winter protection.

P. L. VIALON.

If hung in a cool airy place, leaving two or more inches between each comb, you should have no trouble from this source up to swarming time. If you do, put them in a tight box or room, and sulphur them.

G. M. DOOLITTLE.

Hang them up in a shed or other out-building, with at least two inches space between the frames; or put them in a hive, in a like shape; raise the cover so as to admit the light; catch one or two spiders and place in each hive.

MRS. L. HARRISON.

The best way with me has been to hang them at least an inch apart, in a dry cool place. If the place is damp, the combs will mold. I have kept them in a dry warm place (the barn chamber) in the same way.

A. B. MASON.

Hang them in a closed room, and burn a little sulphur under them at least twice, at intervals of 15 days. Ours are placed in cold rooms during win-

ter, and we have had, for years, several thousands of them used for extracting.

DADANT & SON.

Clean them up by scraping off all dirt and propolis from the frames, and cut out all bad patches from the comb. I put them into empty hives ready for hiving, and find there is no danger from moths if used during the first season. If they have to be kept over for another season they should be put on strong colonies, to be thoroughly cleaned.

GEO. GRIMM.

I keep them in a dry cool place. They should not be piled so that one comb rests against another. If well spread out, the moth is much less likely to disturb them. Such as contain pollen or portions of brood should be kept by themselves and examined more frequently, as they are more liable to be attacked by the moth. They may be fumigated with sulphur if worms appear.

L. C. ROOT.

I can do it best by piling them on top of other colonies, especially the stronger ones. If taken off here in the winter, and piled up in supers outdoors, leaving the combs three-fourths of an inch apart, they suffer but little damage from moth before I need them the next season. Placing them in a moth-proof room, and smoking thoroughly with sulphur, is effectual but more costly.

R. WILKIN.

We have a plastered room 10 feet square, in which we put all such combs; look at them as often as once a week, after warm weather commences; and if we see any signs of worms we go down cellar and burn one pound of sulphur in a little stove that we have there for that purpose. The fumes go up into the room above through a four-inch pipe. If the room is closed tight, every living thing in the room is killed; then if the room is kept closed tight we have no further trouble. We used to smoke combs in a large box, before we built our smoke-room.

E. FRANCE.

If you can discover the dead colony soon enough, provided they die early enough, expose the combs to a temperature of 16 below freezing, which will be 16 above zero; that will kill every moth-germ. Then all you have to do is to shut the combs away from the miller. On the other hand, if the germs are not destroyed, my plan is to keep the combs in a cool, airy room, hanging them on rabbeted strips nailed to the ceiling, being careful not to let them touch each other. Leave them an inch apart. You will find in this condition the moths will make you no perceptible trouble.

JAMES HEDDON.

I hang my combs in boxes, no closer together than they hang in the hives, exposed to the cold of winter, which kills the eggs and larvae of the wax-moth. Care must be taken to keep mice out, as they will ruin the combs in their endeavor to get at the bee-bread. If the wax-moth gets in the combs before I can put them on hives, I set those boxes of combs close, one upon the other, about 10 high on a tight board, and burn about one-fourth pound of sulphur placed in some vessel (an old pie-plate) in an upper empty box, and cover it up. Sulphur fume being heavier than air, settles down slowly but surely, and kills every moth in the combs.

C. F. MUTH.

Nail strips of wood to the ceiling or rafters of your honey-house, so that the combs will hang on them just as they do in the hives. Hang them up, as far apart as convenient, exposed fully to light

and air, and the moth will seldom trouble them. I have kept empty combs thus through two summers, without any loss. If worms do get into a few combs they may be detected at once and sulphured, either where they are or by removal to a tight box. Never try to keep combs out of sight in empty hives or comb-closets. The warmth, darkness, and nearness together of the combs will invite the ravages of the moth-worm. It is almost impossible to keep them out altogether, and under such circumstances they increase so rapidly that, unless the combs are looked after almost daily, they are never safe, and may be completely ruined within a very few days after they seemed all right.

JAMES A. GREEN.

Keep them in a cool cellar, and the worms are not likely to trouble till it grows warm. Then put a queen-excluder over a colony hardly strong enough for supers; pile on empty combs three or four stories high, and put a frame or two of brood in the upper tier. Perhaps the best way is to put the combs in a hive, put this hive on a stand under the colony, so that the bees must pass through these combs to go in and out the hive. You can put them there as early in the season as you please, for it costs the colony no heat. If there is any honey in the combs, look out for robbers by giving very small entrance. Even then you may need to watch. But you can feel sure a colony of Italians will keep the worms down.

C. C. MILLER.

I have a nice comb-closet, double-walled and sawdust-packed, in which combs are put and fumigated with sulphur; and when I don't get around in time, the worms destroy a jolly lot of them in there. Sometimes a set of combs gets left in a hive in the yard for the whole season, in the care of ants and spiders, and I find they usually do a very fair job at it. Perhaps there is a hint worth heeding there. In the usual careless way of burning sulphur, one third melts and runs down into the coals and ashes; one third merely sublimes, instead of burning as it should, and only one third (often very much less than that, I fear) is properly converted into gas. There should be a tin tube running from the outside, through which the fire can be steadily blown with the smoker.

E. E. HASTY.

The above replies cover the whole ground so thoroughly I hardly need add anything to them. I want to thank friend Hasty, however, for calling our attention to the fact that letting sulphur run down into the ashes is not burning it; neither is making it pass off in vapor, or (as he terms it) subliming it, burning. Where much sulphur is to be burned, I do think it would pay to have some sort of an implement that would make thorough work of it, and convert every bit of the sulphur into sulphurous acid. It seems to me that some sort of utensil could be arranged, with draft enough so as to obviate the necessity of blowing it with a bellows. Can any one tell us more about it? As a rule, I believe that combs will be safe from the depredations of moth if hung up in the open air a couple of inches apart, as has been suggested by many. Perhaps if there were much pollen in the combs, however, this might make a difference; for I believe, as friend Muth suggests, that pollen is the principal food of the moth worm. Another trouble about hang-

ing them up in the open air is, that if they contain a little honey they will incite robbing. Where bees are destitute of propolis, they will often gnaw to pieces the combs, when convenient of access. On this account I should prefer a room, not only to keep out the moth, but to keep out robbers and all other insects.

ANSWERS TO QUESTIONS

FROM OUR A B C CLASS.

This department is designed primarily to cover questions either not already answered in the A B C of Bee Culture, or in cloth \$1.25, or, if incorporated in this work, are here dwelt upon more in detail on account of the importance of the question. While these answers are of vital interest to the A B C scholars, they will doubtless be found, in many instances, to be of considerable value to the more advanced student. For lack of space, the question itself, instead of being directly stated, is omitted, the same being implied in the answer. It is hoped that the class will first consult their text-book before sending in their questions.

G. G. G., Pennsylvania.—Situated as you are, and as in old age you can not climb trees, we would not advise you to allow swarming. Your better way would be to divide. Read the article on Artificial Swarms, and also Dividing, in the A B C.

J. C. G., Virginia.—To get the largest return in extracted honey, you should not prevent your bees from swarming entirely, but you may discourage it largely. Give the bees plenty of room and shade. Do not let them get at all cramped for room. For after or second swarming, keep the cells all cut out but one. See Question-Box for last issue.

HONEY STATISTICS.

H. W. B., Virginia.—The Honey Producers' Exchange, gotten up by eastern bee-keepers, will in no way conflict or interfere with the usual statistics for GLEANINGS. Both will be found to be useful to bee-keepers at large.

SHIPMENT OF QUEENS, AND OUR GUARANTEE.

E. B., Ontario.—We do not guarantee any of our queens beyond safe delivery, because stock of all kinds, whether queen-bees, or cows and horses, are liable to deteriorate at any time after delivery into purchaser's hands, the breeder himself not being in any way responsible for the result, if it can be proven that the stock was healthy at the time of sale.

SAWDUST IN PLACE OF CHAFF; ITS VALUE AS AN ABSORBENT.

W. B. M.—Sawdust will answer in lieu of chaff, in chaff hives. The only objection to it that we know of is that it makes the hive just so much heavier to lift. There is this to be said about chaff, however, that it is lighter, and more porous. O. O. Poppleton rather gives the preference to dry pine sawdust, next to timothy chaff.

HOW TO RAISE PURE ITALIAN QUEENS IN LOCALITIES WHERE THERE ARE BLACK DRONES FLYING.

J. N. P.—Yes, you can secure purer queens by killing off your neighbors' drones by means of the drone-trap, if they (the neighbors) are willing. It is possible that you may be able to raise pure queens; but to do so, see that all drone brood is destroyed, and that all the flying drones are captured in the trap. In the meantime, raise as many Italian drones as you can.

THE DOVETAIL ON THE NEW HIVE NOT A DOVETAIL IN A STRICT SENSE, BUT STRONG ENOUGH.

H. F. H.—The dovetail on the new hive is not a dovetail in the strict sense of the word. It is just the same as the dovetail on the sections, only on a larger scale. It would be impossible to make a true dovetail, and make the hive cheap enough to be used by ordinary bee-keepers; but when the present joint is strong enough to hold a man's weight on its diagonally opposite corners, what need have we of a stronger corner?

WHY BEES DO NOT GATHER HONEY SOMETIMES.

L. L., Arkansas.—The reason, doubtless, why your bees are not doing anything is because there is nothing in the fields for them to gather—or, at least, not at the time you mention in your letter. There are only certain times in the year when bees can gather honey and store surplus. A good deal depends on your locality. If you consult some old bee-keeper in your vicinity he will tell you when you may probably extract honey; but there are exceptions to all periods, when the honey-flow is usually pretty good.

I. F., Tennessee.—The reason why your bees appear crosser at one time than at another is due, perhaps, altogether to the difference in conditions, both in weather and time of day at which you make your examinations. When the weather is a little chilly, or after a rain, or toward evening, or when honey has suddenly ceased coming in, the bees are apt to be cross. As we judge you have the A B C book, please read the article on stings; also "Anger of Bees." After having read these you can better judge of the proper time to examine and handle your bees.

IS IT POSSIBLE TO SET OUT HONEY-PLANTS IN SUCH ROTATION AS TO KEEP THE BEES BUSY THROUGH THE SEASON?

G. D., Australia.—It is barely possible, but hardly practicable or feasible, to grow honey-plants in such rotation as to keep the bees busy from one season's end to the other. We have experimented in this matter quite largely, and we find that it does not pay to set out those honey-plants which do not yield any other revenue than the honey they may furnish the bees. We have been in the habit of recommending, for several years back, setting out only those plants which will pay in the seed crop, providing the blossoms should yield little or no nectar. Buckwheat and alsike are both tolerably safe investments.

IS IT FOUL BROOD, OR CHILLED BROOD?

I. N. H., Ohio.—It is possible that you have foul brood, although from your brief description we can not say for certain about it. We have sent you our A B C of Bee Culture. Please read the article on foul brood. You can tell very quickly whether you have the disease, by a careful comparison of the symptoms. We would advise you not to be in too great a hurry to decide. During the last few days, a good deal of chilled brood has been reported, and we have had more or less of it in our own apiaries. This brood, of course, dies, and sometimes causes beginners to think that they have foul brood. Be sure not to confound the two. Chilled brood is simply brood that has died and shrunken. There is no ropiness about it, and it does not turn brown, as does foul brood.

WILL THE WIND BLOW OFF SUPERS WITH SQUARE EDGES? HOW TO MAKE A $\frac{3}{8}$ -INCH GROOVE.

W. P. D., North Carolina.—No serious trouble has been experienced from supers blowing off, having square edges. The bees will soon stick them with propolis, so they will hold their position. This kind of super has been used for a good many years, and little if any trouble has been reported on this score. Making a projection, or a telescopic joint, for dovetailed supers, would be only adding to the expense of the hive, with but little if any thing to its general utility. To make a $\frac{3}{8}$ groove on a 14-inch mandrel, use a wobble saw. One of your common saws will do, used in connection with wobble washers, which we sell for 25 cts. a pair. There is no cutter-head nor combination of saws that will make a $\frac{3}{8}$ cut as nicely and easily as the wobble saw. By the use of the washers spoken of, any of our common mandrels can be readily adapted to it.

DISINFECTANTS, NONE RECOMMENDED BUT BOILING WATER.

A. C., New York.—We have very little faith in any thing to clean hives of any kind, of the germs of foul brood, except boiling hot water. We have tried acids and such other disinfectants as are usually effective in other maladies. Even hives that have never been disinfected at all, will sometimes contain a new healthy colony for four or five months before transmitting the disease to its occupants. There is a great liability of making mistakes in testing any remedies or disinfectants, for the very reason that it may be months and months before the hive would impart the disease, even without any disinfectant. We feel quite sure you will have further trouble, in a year or so. We experimented very largely in this matter of disinfecting hives, and have tested diseased hives that have never been treated at all—the latter not showing a trace of the disease in the occupants for six months after the old diseased colony had been removed.

WHY THE BEES SOMETIMES CARRY OUT YOUNG BROOD; A STRIPED WORM.

L. L. C., Virginia.—At this season of the year, particularly after cold freezing spells, it is nothing uncommon to find a few immature young bees and larvæ carried out at the entrance. Their presence at the entrance may be due to either one of two causes. First, they may be what we would call chilled brood. Warm weather coming on early in the season, the queen enlarges beyond the capacity of the workers, and during a sharp cold spell, later on, the brood, some of it, chills. The cluster of bees always draws up a little closer during a freeze, and they not infrequently compress beyond the outside limits of some of the brood. Second, it is possible that the colony is on the verge of starvation; and as brood-rearing consumes stores rapidly, the bees, to diminish the consumption, sacrifice the brood by carrying it out rather than to sacrifice the whole colony. There is one other reason why bees carry out young brood; but it seldom happens, except among hybrids and blacks; that is the ravages of the moth worm. Where the colony has nearly been used up by bee moths, mutilated larvæ in all stages will be found near the entrance every morning. The great worm with dark gray stripes around its body, which you mention, we feel pretty sure had nothing to do with the dead brood at the entrance. Its appearance was only a coincidence, we think.—May 2, 1889.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all questions, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

THE MINORCAN BEES.

WILL you please inform me about Minorcan queens or bees? Are they docile, like the Italians, or are they like the blacks? What race of bees are they? Are they any good? Bees are working on maple; no winter loss.

JOSIAH EASTBURN.

Fallsington, Bucks Co., Pa., Apr. 8, 1889.

[Not much is yet known respecting the Minorcan bees and queens. Mr. F. F. Andreu, of Port Mahon, Island of Minorca, Spain, says they are fairly good-behaved bees, though, if we are correct, not quite so gentle as the Italians nor so vindictive as the Eastern bees. They are fairly prolific. Mr. Andreu can furnish such particulars as you require. He writes English.]

BEES JUST BOOMING.

Bees are just booming out here. I have had two swarms, and every hive in the yard is working in the sections.

JOHN BLODGET.

Flag Springs, Mo., May 25, 1889.

SNAKE IN A BEE-TREE.

Not long since I found a bee-tree; and when I cut it, in the hollow with the bees I found a good large black snake, but very few bees, and no honey. From the looks of the comb I thought they must have gone in the tree last season.

S. L. MEDLIN.

Moltke, Tenn., May 18, 1889.

FEEDING INSIDE OR OUT OF THE HIVE.

How far away from my two hives must I put syrup to feed them (I suspect their honey is getting scarce), so that they won't begin to "rob?"

Red Creek, N. Y.

A. D. MCINTOSH.

[Do not put the syrup outside at all. Put it in a pan, or, better, a regular feeder inside of the hive. If there is not room in the hive, put on another super or body, and place the feeder on the frames.]

WHY ARE BEES CROSS DURING SWARMING TIME?

Why is it that bees are so cross in swarming this year? I never had trouble before. I know of others the same way. I have the Italian bee. They have been well fed this spring, and they are strong and healthy.

W. N. GEORGE.

Mechanicstown, O., May 30, 1889.

[If you have had such weather during the month of May as we have had here, I do not wonder that the bees are cross. A great part of the time it has been too cold for the bees to fly, and too cold for them to secrete honey, besides being rainy to an unusual extent. Cold storms always cut off the honey-supply, and make the bees cross.]

HIVING IN 30 SECONDS.

Prepare a one-story hive by lightly nailing the bottom to it with large entrance; leave out the frames. Prepare a one-story hive with frames for the bees to occupy. Place all convenient to where the bees have settled; shake the bees into a large-mouthed tin pan; dump them into the story without frames; place the one with frames on top of it; tap lightly on it and the bees will go up into it, and the work is done. I was timed, a week or two ago, and I hived a swarm in 30 seconds.

Hornhill, Texas, May 17, 1889. G. L. JENNINGS.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows, viz.: *Sheep Off, Silver Keys, The Giant-Killer; or, The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room.* We have also *Our Homes, Part I., and Our Homes, Part II.* Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

MY BROTHER'S BEES.

My brother has six stands of bees. He got 128 pounds of honey last year. We ate over half of it, and sold the rest.

MAUD CHADWICK, age 10.

Lorings, Kan.

TURKEYS.

I saw your notice in GLEANINGS. I don't know much about bees, so I'll write about turkeys. Every one knows that they are easily drowned, and they must be kept out of the water when they are little. This fact every person may not know: That some who have the best success in raising them feed them quite often broken dishes pounded into small pieces.

MARTHA WRIGHT, age 11.

Cooperdale, O., Feb. 26, 1889.

BEES AND TURKEYS.

Papa had 120 colonies last fall. He doubled up some of the weak ones, and now has 114. He makes his own foundation with the machine he bought of you. We also raise turkeys. We have the bronze, and we have a pair of wild ones. Last year we raised some half-bloods that weighed 20 lbs. when six months old. They were the finest in the market. The wild ones are the prettiest, and will fly much higher and further.

RAY C. JOHNSON.

Venice Center, Mich., Mar. 6, 1889.

SWEET POTATOES, HOW TO KEEP.

Father has been keeping bees for 20 years. He caught his first swarm when he was 16 years old. The winter of 1870 they all died, and last winter all died but three stands. He has eight stands now. He uses Simplicity hives. I believe it is not generally known that sweet potatoes wrapped in paper, each one by itself, and kept in a dry place, free from frost, will keep all winter.

Oxbow, Ills.

ALBERT FORREST, age 13.

A SNAIL AND A "POISON THING."

Papa hasn't any bees, and so I can not write about them, only that he is going to get some as soon as he can. One day I found a snail. It was all like glue, and had a cap on his head; and it could raise it up and stick its head out. I liked to watch it crawl. My sister and I went to get some wood, and we found a poison thing. It had two feet in front, like a crab's feet, and had a tail, on the

end of which was a curl, and papa says that they kill people. GRACIE PADDOCK, age 9.

Lucky Queen, Oregon, May 29, 1889.

We are a little curious to know more about that "poison thing" which you mention. Ask your papa the name of it, and tell us in your next letter.

THE CHAPMAN HONEY-PLANT; HOW TO GET THE SEED FROM THE BALLS.

I want to ask you how to hull the seed out of the chaff of the Chapman honey-plant. We don't know how to get the seed out of the chaff. The bees work strong on the balls. I was a bee-man all last summer. Pa has been sick. We got 27 swarms; 4 went to the woods. We got 85 lbs. of honey last summer. It was a poor season for bees here.

Monticello, Ind. HOWARD WHITCHER, age 11.

It is a very difficult matter to get the seed out of the hulls without a machine. The only machine we know of is owned by Mr. Chapman himself, of Versailles, N. Y. He has described it in one of our back volumes, but you might write him in regard to it.

NO CALF TO KICK OVER HIVES.

I am ten years old. I like to read the letters in GLEANINGS. I love to go to school. We have a dear good teacher. She is not cross, as that other boy said his teacher is. We keep several hives of bees, but we have no calf to kick them over; but we have an old horse. He got near them, and they began to sting him. He ran away, and hid behind the stable; but the bees soon found him and stung him very badly. GEORGE TEGMEIER.

Carpenter, Ill., Mar. 29, 1889.

POLLEN FROM PUSSY WILLOW.

I will write you about bees. The first pollen I saw our bees fetch in was the first of March. It was from what we call pussy willow. We have 120 swarms of bees. We have not lost very many yet, but we have doubled some that were too small. We have had two fertile workers. The way we get rid of them is to put a heavy swarm with them that has got a good queen.

SWEET POTATOES.

We tried Mr. Root's plan of cutting sweet potatoes in two, and they all rotted for us.

CHAS. CHAPMAN.

BEEES IN GERMANY.

My father has two apiaries, one in Germany and one in this city. I was in Germany two years ago, in Ottersberg, Hanover. I noticed that there are more bee-keepers there than in any place else. The hives they have there are made of straw, which they claim are the best. I have also seen the Gravenhorst "bogenstulper." My father keeps his bees on Simplicity frames. He has a house apiary large enough for a hundred of these hives. He has the light hives like the Simplicity hives, in Germany. My father has your A B C. I love to read it. Our bees are all gathering pollen, and we are going to move them to the country about April 15.

Jersey City, N. J. ANNA BLANTON, age 11.

SAWDUST PACKING AROUND THE BEES.

My sisters, two of them, tried to keep a hive of bees through the winter. Papa had a sawmill then, and they went down and got some sawdust and put it all around the hive and covered it up, and they kept them through the winter, and in the summer

papa sold the bees. One winter day my sister and I went out where the bees were, and they were on the ground, frozen, and we took them into the house and laid them on the stove-hearth. After a while the house was just full of bees, and we opened the door and let them out, and they went back to the hive again. NANNIE McCORRY, age 11.

Marysville, Ohio.

The bees went back if they did not get chilled before they reached the hive.

A MOUSE IN A BEE-HIVE, AND WHAT THE BEES DID WITH HIM.

When pa set his bees out of the cellar, there was a mouse that had a nest in the mat on top of the hive. Pa tried to catch it, but it ran down in the hive. Pa said that they would make it hot for him in there. Pa waited a little while, and we went back to the hive and found the mouse in his nest almost dead. Pretty soon he died, and I picked 16 stings out of his skin. Our bees are in a fine condition. We put 60 swarms in the cellar last fall, and they all wintered well except four, whose queens died. GEORGE W. RICE, age 12.

Boscobel, Wis., May 19, 1889.

HOW PAPA WINTERED HIS BEES.

Pa takes GLEANINGS and has the A B C. He has 40 colonies of bees, which wintered nicely. He wintered five in chaff hives on summer stands, and 35 in the cellar. He has a tile pipe put in the ground 7 ft. deep, which goes out to the road about 100 ft. This brings in the pure air. Then he has a pipe that runs from the bee-cellar to the stovepipe. On the end he has a large tin, shaped like a funnel. This draws all the impure air up the pipe, and through the stovepipe outdoors. The bees that were left on summer stands began bringing pollen from skunk-cabbage, April 7th. This was the first that we have noticed. ADDIE FLANDERS, age 9.

Boston, Ont.

THE TARANTULA, AND THE EFFECT OF ITS BITE.

Mr. T. G. Ashmead, in March 15th GLEANINGS, is quite right about tarantula nests. There are lots here. We have a little black and white velvety spider that lives a good deal in houses and buildings. They jump and bite. One bit me on the finger the other day, and my finger, thumb, and wrist swelled up in about half an hour. It did not hurt much at first, but got very painful, and hurt me all up my arm. I have been having it doctored for two weeks, and now it is getting better. It broke and discharged a good deal. We have a hive that swarmed twice, and went back. I was glad to see papa's letter in the last GLEANINGS. I would tell you how he got swindled by a New York firm, only you have so much to attend to. All the swarms we have had this year seem to be wasting a good deal of wax. The ground is white outside with the little flakes.

Lytle, Tex., Apr. 23, 1889. WALTER HAILES.

"JUMP OFF, JOE," ETC.

We came from Nebraska. There is hardly any thing there but wide prairies; but in Oregon there are lots of things to write about. There is a large creek called "Jump Off, Joe." It flows through a corner of papa's farm. It is very pretty, there are so many rapids in it. On the other side of it the bank is thirty or forty feet high, straight up and down. From the top of the bank, Red Mountain begins. People say, that in the summer a great many rattlesnakes come out of the ground.

There are many kinds of flowers here. One kind is called "kitten-ears." There are three leaves in the flower, shaped like a kitten's ear. They are covered with little hairs inside. It is a little pink. There are other flowers, called bird-bills. The head and bill are found in the flower. The head is purple, leaves thrown over, and the bill is black and yellow.

JESSIE B. PADDOCK, age 13.

Lucky Queen, Ore., May 5, 1889.

HOW TO GET GRANULATED HONEY FROM THE COMB.

Our bees gathered in a nice lot of honey last summer, but it granulated in the comb so badly that pa could not extract much of it, so he put it in a pan and melted it on the stove. He lets it cool, and, as the wax rises, he skims it off and then strains it through a cloth. It is almost as good as extracted honey. As it is so plentiful, in some cases we use it in place of sugar. We use it in sweetening apple-butter, in making sweet pickle for plums, and baking cake. I will give you a recipe for the cake:

2 cupfuls of honey, 2 cupfuls of buttermilk, $\frac{3}{4}$ cup butter, 1 tablespoonful soda, 3 eggs, 5 cupfuls of flour. Flavor with ground cloves. This will make two good-sized cakes.

CLARA M. STREBY.

Paw Paw, W. Va.

ABSCONDING WITHOUT A QUEEN.

Mamma had a swarm of bees go off and leave their queen last summer. They got the swarming fever, and swarmed out two times; then she killed the queen and gave them a new one just at night. They accepted her, and on the next day swarmed two times. She then caged the queen, putting on the tin slide so that they could not gnaw her out. The next day they swarmed out and went off, and left the queen in the hive in the cage. We think this proves clearly that it is the bees that get the fever, not the queen. It also proves that bees will go off and leave the queen.

BIRDIE RUSSELL, age 10.

Beatrice, Neb., Apr. 21, 1889.

Your letter does not necessarily prove that the bees are the first to get the notion of swarming, but it goes a long way to prove that a swarm may abscond without a queen. However, unless we can get more testimony to the same effect, we should incline to the opinion that the bees had some sort of a queen with them—very likely a virgin, whose presence in the hive your mother did not know of.

A TALK TO THE LITTLE FOLKS.

BORROWING TROUBLE; CLIMBING MOUNTAINS, ETC.

DEAR CHILDREN:—I know a little boy who always thinks you mean him when you say any thing was not done just right. Do you know any one like that? He sometimes begins to cry and fret, and gets a scolding, when no one had thought about him when the first remark was made. That is caused by self-consciousness, or thinking so much about himself. Don't you think he must have a queer time? Certainly it is not altogether a happy one. Real troubles are hard to bear; but imaginary ones are horrid. Now, if any one is thinking, "Why, I believe Aunt Katie means me, and I am not going to like her any more," just stop a moment and say to yourself, "What is she saying this for—so that she

will be any better off, or is it me she wants to have a 'gooder' time when I am among folks? I know I have got so that I can not go anywhere without getting mad at some one for talking about me, or commenting on the clothes I wear, or something—or at least I think they are doing it, if I catch them looking at me. I guess she does mean me."

Not long ago a young girl who had made herself quite a favorite among her schoolmates saw the boys and girls whispering together and looking at her. She asked them what they were talking about; but they only laughed, and would not answer her. At noon time she saw them whispering together in little groups, and she would run up and try to hear what they said; but they would stop talking when she came near. Instead of paying no attention, and being happy some other way, she began to pout, and finally said to herself, "I won't come to this school any longer. They are a mean, hateful set."

At night she went home feeling very unhappy. Her mother had been told that the young folks were going to surprise her daughter that evening, so she advised her to go to town with her father and she would feel better when she got back. While she was gone her schoolmates came, bringing cake, candy, and oranges. They all hid in one of the rooms; and when Jessie got back they rushed out into the room where she was. She was so astonished that they all laughed, and told her that they hoped she would not be mad at their whispering together any more. She begged their pardon, and I think it taught her quite a lesson.

Now, after our little talk, suppose you all go with us for a grand picnic. About ten miles, straight up the valley, is a range of mountains, and away up on one of them is a lake called Zaca Lake. We should like to go and camp awhile, but we have not time now, so we will just take our lunch along, for it will be about noon when we get to where we shall have to leave the horses, or at least the wagon.

"Where are John and Ernest?"

"Oh! they have got so impatient they have started on. Are we all ready?"

"Yes."

Then away we go up the main road about two miles, and now we take this road to the left. How beautiful every thing looks! The hills are blooming with flowers, and the wheat and barley in the valley are growing finely. It is February, and the air is cool this morning; but now the sun is peeping up over that hill in front of us, and we shall soon be warm. See how lovely the hanging moss looks on those white-oak trees. It looks as if it were threaded with beads. The drops of dew sparkling in the sun make it look that way. Here we are, four miles from home, and we can not see those impatient boys yet.

"Oh, yes! I see them, mamma," shouts Lewis.

"There they are, at that gate."

Sure enough, and there are the two dogs along with them.

"Well, boys, I hope you are ready to ride with us now."

"It was so cool we enjoyed the walk very much; but it is warm now."

"Isn't it a lovely morning?" says our neighbor John; and into the wagon they climb.

"Let us see; we must turn to the right pretty soon. There is where Mr. Edgar used to live. Why, they have got the road fenced on each side since I

was here last. Doesn't it make a pretty lane? Such lovely feed for the campers' horses! Yes, and here at this lone windmill is where several have camped. We all must have a drink from the large tank, and the horses can be watered at the trough. No, there is no gate. You must hand it to papa through the wire fence. How refreshing a good draught of water is! Even the baby drinks, and smacks her lips with pleasure."

Away we go again, getting nearer and nearer those majestic mountains. We have been coming up faster than we realized, for they do not look so very high now. Yes, we must be about 1000 feet above our house. We are now about ten miles from home. What a lot of lovely land, to be used just for cattle! It seems a pity that it can not be divided up and made into small farms! Well, it will some time, may be, but not in our day. There comes a buggy with two men in. Let us ask where the road turns off from this to go to the lake. The first gate to the left, at the foot of the hill. Here it is, and, unlocked. Isn't that good? Mr. C. told us we might find it locked, and then we should have to give up our visit to the lake. But we are lucky this morning.

"I knew we should be," says John, "for we have found so many horse-shoes; that means luck, you know."

"Whew! I wish they had not plowed into this road, as it makes it so hard for the horses."

"May be this is not the road."

"I will run on ahead and see," says Ernest.

Soon we see a traveled road on the other side of the fence, and we pass through another gate and enter the woodlands at the foot of the peak where the lake is. Isn't this picturesque? Sylvan glades, browsing cattle, babbling streams, and singing birds. Can we cross on that frail-looking bridge? Oh, yes! with care. Well, I am glad we are over that. I haven't drawn a good breath for two minutes. Dexter, the colt, was quiet, and went along as well as Bess. A good gentle team is a pleasure when we are going over bad places. We are climbing up, and we are nearing the camp, I should think.

"Well, I am agreeably surprised," says one.

"How?"

"Why, you know the mountains look so rough and rugged from our place; but see how pretty they are, now we are upon them. Flowers, trees, green shrubs, and wild oats cover the steep mountain-sides, and lovely glades tempt us to camp on every side; and, see, we are so high up that the pine-trees begin to be scattered among the others. The native pines rarely grow on the hills. They grow only on mountains where snow falls during the winter months. How proud they look! How straight and trim! They seem to point above to Him who made us all. Oh, what a pretty camp! I guess this is as far as we can go with the team, so we will jump out and you older boys help unharness the horses, and the little boys can pick up sticks for the camp-fire. I think that must be water from Zaca Lake in that stream, it is so clear and soft. There is the fire; now put on the sauce-pan full of water, and we shall soon have some coffee. Then while the horses are cropping the tender herbage we will eat our lunch. Why, have you got done already?" we say to the big ones.

"Yes, for the present. We want to see that wonderful lake we have heard so much about."

"Shout when you get up part way, if you think mamma could climb up there."

We soon hear a shout; and as we have satisfied our appetite we put away the things, give the horses some barley, and, with papa carrying the baby, away we go.

"Come on, little ones; not too fast at a time; it is quite a long walk up hill, so stop and breathe a spell. I hope you all have old shoes on, for this rock wears the leather very fast. There, now, we have got over the worst of the road. See what a nice path has been made in this black earth. What queer kinds of bushes, and such lovely ferns! We will get some when we return. The manzanita, with its smooth red bark and the gray-green leaves and white blossoms, would be quite an ornament in a front yard. Oh! pine nuts! See, the boys are getting nuts from those large cones. Sure enough, the big boys have found a lot. They are rather dry, but quite sweet. Where is the lake? Oh! just around there, and they point to the right. You won't see it till you get to it," so we all jog along, looking for the first glimpse with one eye while we are admiring the pine-trees, which now predominate, with the others. "Just see that sharp point of mountain. The trees look as though they would slip off, it is so very straight up. The lake is at the foot of that peak. Oh! there is a log house, and here is the lake."

A hush falls upon the whole party as we stand and see the strange view before us. A small body of water is seen, with rushes and other water-weeds fringing the edge, and sharp mountain-peaks all around it but just where we stand; and over all, that strange awe-inspiring hush that pervades all forests and mountains. I like to enter those vast solitudes sometimes; but the pioneer spirit is not strong enough within me to wish to linger long so far from human habitations. There have been two log huts built by campers, but they only enhance the lonely feeling, to me. They look very forlorn. We sit down and impress the picture before us upon our mind, and listen to the cry of the loon, the only living thing besides ourselves to be seen. The sun has begun to go down the mountain, and we must go too; so with one last look we return down the path we came, wishing we could go down from the other side of the lake, but that would make our journey 20 miles further, so down we go, plucking flowers, ferns, branches, young pine-trees, and the sweet laurel leaves. Now we slip and slide when we get to the shady place, and how hungry we all are now we have got back to camp! We hastily eat the remainder of our lunch, and now we are trotting along on our homeward way. As we cross the creek the last time, we will have the big boys fill these two bottles with water, and we can give our friends at home some of the famed waters, even if they could not enjoy the picnic with us. The sun is down, but we shall soon be at home. How pretty the moon looks, peeping at us through the trees! Here we are. Thank you for going with us.

Los Alamos, Cal.

AUNT KATIE HILTON.

And, good friend Aunt Katie, we thank you also for taking us along. Your description of mountains and mountain travel is very vivid and lifelike, and a dozen things remind me of that wonderful trip of mine. If I am correct, the Californians are more in the habit of going out picnicking, and taking such strolls, than we are here. Perhaps it is a lesson we ought to learn.

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

WET WEATHER.

WE have been having two or three weeks of bad rainy weather. Locust, raspberries, and other kinds of bloom have been out in great profusion, but the bees were unable to make use of them. White clover is out in unusual abundance; and although it has been in blossom for a week, the bees have been forbidden by dame Nature to visit it. To-day, June 10, the weather promises to be favorable; the sun is shining brightly, and the weather is warm. Yesterday, between the light warm showers, in spite of the heavy wind, the bees were out doing their level best. There is still strong wind. No honey has been gathered to any appreciable extent so far. In fact, we have been

OBLIGED TO FEED

for the last two weeks. I believe I never saw colonies use up stores as fast as ours have done for a few days. One or two stocks that had been recently fed, starved in spite of us. Starvation was not due to neglect, but due, rather, to the inferior quality of the food. Having some old soft maple sugar in cakes, much of it unsalable, we made it into a thin syrup. This we fed out entirely. One or two of the colonies, after feeding, showed signs of dysentery. After feeding this stuff I came to the conclusion that granulated sugar, even at its present high price, is just about as cheap as the inferior sweet, because it is better and goes farther. Lately we have been feeding granulated syrup, and we have since noticed none of the bad results.

A large majority of our colonies, I feel sure, would have starved had we not fed them. It is rather discouraging to feed when white clover, raspberries, and locust are successively in bloom in such profusion, and yet the bees are not able to get the sweets. The bountiful rains we have been having, I am in hopes will more than make up for lost time. As we feed only to keep brood-rearing going steadily, we feed small quantities daily, and for this we use butter-dishes. For stimulating feed, I do not know of any thing we like better; even throwing out the item of cheapness, I am emphatically in favor of the butter-dishes. When we moved the colonies down into the basswood orchard, in the Dovetailed hive, we had a great many wire-cloth screens. These screens are simply a rim $1\frac{1}{2}$ inches deep, covered with wire cloth, the rim made the exact size of the Dovetailed body. Well, we placed two butter-dishes on top of the brood-frames of each hive, and placed one of the wire-cloth screens over the whole. Through the wire cloth we poured the feed, put on the regular cover, and every thing was done. To give the next feed, all we had to do was to raise the cover and pour the feed through the wire cloth. This arrangement proved to be exceedingly simple and very satisfactory.

FEEDING WITHOUT A FEEDER.

We ran out of butter-dishes and wire screens. I told our Mr. Spafford to pour about $1\frac{1}{2}$ or 2 pounds of syrup all over the brood-combs and among the bees; if the colony were weaker, to give them a proportionate amount in this way. We tried this on about a dozen colonies. In about twenty minutes more we examined those so fed, and found that they were all nice and dry. Once or twice I feared they might not be able to recover from such a sousing of syrup. This dose was repeated a number of times, and the bees each time recovered from it. The colonies were very strong, otherwise I should have hesitated about giving them such a smearing. For feeding this way, the Dovetailed bottom-board worked very nicely. By referring to the annexed engraving,

which I gave some time ago, you will see that the bottom-board is sunk. By tilting the front end up temporarily, we found this bottom-board would make a very good feeder. In pouring the feed right over the combs, you observe that the bottom-board will take the excess, and retain it there till the bees can use it. The excess of even two or three pounds can be held in this way, and I do not know but it makes a very good feeder.

CARNIOLANS.

Several years ago I gave a rather adverse report of these bees. Feeling that I had perhaps been a little too hard on them, I requested one of the leading breeders of these bees to send us one of his best Carniolans. He did so, and we have had them for nearly a year now. I was disposed to feel favorably impressed with them, and desired Neighbor H. to take them to one of his apiaries, and, if they proved to be a good race of bees, to make preparations to raise them in one of his apiaries, isolated, of course, from all other bees. Chancing one day to think of these Carniolans, I asked him what he thought of them. Well, he didn't "just exactly know"—his answer indicating pretty plainly that he liked the Italians better. To satisfy myself directly, I one morning hitched up Billy in the cart, and started. Neighbor H. was not in the apiary at the time, but I readily found the bees. Of course, I proceeded to open up their hive without smoker or veil. Not endeavoring to be exceedingly "rambunctious," as the boy says, I proceeded to open the hive, using ordinary caution. I had scarcely got the cover and the cushion off, than the air was filled with Carniolans, buzzing around in a to me unusual manner. They began to sting, but I held my ground. Neighbor H. then came around, and I asked him where his smoker was.

"Oh!" said he, "you don't need any smoker for those bees," and a little sarcastic smile played over his face. I had explained to him that they could be "handled without smoke." However, I insisted on the smoker, which was brought, and used

upon the bees. Instead of quieting them down it caused them to fly into the air like a little swarm. From the frames lifted out, the bees ran down, and hung in little balls, and in the hive they were running about in wild commotion. I was almost positive they were black bees; but Neighbor H. assured me with all confidence that those bees were the progeny of the very same queen I had given him to test. They resembled very much the Carniolans we had had on a former occasion, which were imported. They were pretty cross, and I got one or two quite severe stings. If I were to judge the Carniolans by this colony alone, I should say that, when they do sting, they sting with a vengeance. To tell the truth, I wanted to be favorably impressed with the Carniolans, and I do not know but I should like to be so impressed now. One quite serious objection, however, and one that has been mentioned before, is, that if there were black bees in the vicinity in which they were reared, it would be almost impossible to detect the crosses, except, perhaps, by their behavior. In fact, from what I have heard in general from the Carniolans, I should be inclined to believe that the colony above mentioned, instead of being pure, is a cross of the black bees. If such is the case, then even the breeder himself may be easily deceived. How is he to know, then, whether he has bred the race in its purity, if he depends upon mere looks? This report of the Carniolans applies only to the one colony in question. I hope further trials will give me a better impression.

IMPORTED ITALIANS.

Perhaps I should say right here, that Neighbor H. said he had an imported Italian colony that had got their hive crammed full of honey, when other colonies were on the verge of starvation. In fact, he intimated that she was a better queen than the Honey Queen I mentioned in last GLEANINGS. While there I requested that he would not show me the imported queen, adding that I wanted to see if I could discover the colony in question by the peculiar energy at the entrance. Not being acquainted with the apiary, I did not know where this or that queen was. We looked at a number of colonies, and finally I ventured to remark, rather cautiously, "Is that the imported queen?"

"That is the one," he said. "Now," said he, "lay your smoker down; pull it open as roughly as you please."

I did so, and every thing was perfectly quiet. I pulled out comb after comb, and there was not the slightest demonstration of any hostility on the part of the bees. Yes, it was true that there was a great deal of honey in the hive.

"Don't you sell that queen," said I. "Keep her for raising queens. A queen whose progeny is gentle and exceptionally good workers, is worth something."

Neighbor H. has already got cells under way from her.

While I was looking over the bees, we came across one other imported queen. Her bees were just as gentle, and were doing nearly as well as the first one we examined.

I told Neighbor H. that he had better keep that one too. The more I examined the apiary, the more I became convinced that the imported queens were doing the best. They were certainly the gentlest.

Some weeks ago, Mr. Spafford incidentally remarked that the colonies having imported queens were doing the best on apple-blossoms.

"Yes," I said, "I have noticed the same thing before. They are not only the gentlest bees we handle, but are just as good, and very many times a little better honey-gatherers." As I have before said in this department, I now repeat again, there is something in the climatic conditions of Italy that produces a hardy, gentle, and industrious race of bees. The bees of the imported Italian colonies are, as a rule, leather-colored. I have also noticed that the very light Italians—those that looked real pretty, such as bee-keepers like to exhibit at fairs and elsewhere, *are not the bees for real business.*

THAT HONEY QUEEN.

That "honey queen" in the basswood orchard, mentioned in our last issue, is still doing well. Although very yellow herself, her bees are quite dark, leather-colored Italians. While the other colonies have required constant feeding, these bees have kept their brood-nest pretty well supplied with natural stores; but unlike the imported colonies referred to, they are pretty cross. The first time I opened them up and hauled them over, I got a good severe stinging, and I was heartily glad when I closed them up again. By the use of plenty of smoke I find since that I can handle them quite easily, but they will not tolerate even then very many unnecessary jars.

"HAS HE AN AX TO GRIND?"

As I read down this report, I have been wondering whether some good brother might not add, "Has he an ax to grind?" Well, I admit that it looks a little so; but I have tried to be candid, irrespective of the aforesaid "ax." If I can not state a thing honestly, for fear that somebody will say that "he has got an ax to grind," then I am in a poor plight indeed. If the Carniolans are a desirable race (and they may prove to be such), then we can sell them just as well as the imported Italians.

LATER.

June 11.—Since yesterday I notice that the bees are beginning to make their combs bulge a little, and white-clover honey is at last coming in. The weaker colonies do not show very much new nectar. The stronger colonies have gathered enough to fill their brood-nest to perhaps two-thirds or three-fourths of their capacity. It is a little cooler to-day, and bees are not flying to the extent they were yesterday. Rain and cloudy weather seems to be the order of the day, with a little sprinkling of sunshine now and then. If this order were reversed, we should have a good flow of honey, I think. All the conditions are supplied except sunshine and hot weather.

This afternoon the sky has cleared up and it is warmer. We hope for the best.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

THE KUMERLE LIMA BEAN, AND GETTING TWO CROPS IN ONE SEASON.

YOU asked such of your readers as can raise lima beans *during the winter* to write to you. I have seen but one winter in 18 wherein they could not be raised here, and they have been repeatedly raised for home use. They live two or three years, and with but little care, and make, on suitable soil, even better yields than northern grown seed. The seewee, planted at the foot of old stumps, grows readily and with no care after it begins to run, and bears enormously. Early in October is the best time for planting here, as the weather is moderately cool then, and there is ample time to grow before the coldest weather comes. I could undertake $\frac{1}{4}$ acre or less.

Palma Sola, Fla., May 26, 1889.

J. F. SIKES.

Well, I declare, friend S., we have got it after all, haven't we? But what you say about lima beans living two or three years is to me astounding. I saw pumpkin and squash vines in California that had been growing for several years; also tomatoes; but in some way I had got it into my head that a bean, after it had borne its crop and matured its seed, had got to die. Well, we shall have to live and learn. As soon as the Kumerle lima beans are ripe enough to grow, I will send you some seed, but I hardly think I shall have enough to spare for a quarter of an acre. If you plant seed in October, as you state, what time would they ripen? Unless they would be ripe enough to plant by June 1 in our locality, they would not be of much use. Last season we planted a long row of the kidney wax beans. The seed was gathered just as soon as the first ones were apparently full sized. But only a bean or two came up in that long row: these were feeble, and amounted to nothing. From this I infer that the seed must become perfectly ripe and dry before it can be planted to grow again. I do not quite understand it, however, for our lima beans, which we gather green, and shell for the wagon, have, during very warm weather, heated in the little baskets so as to send out sprouts half an inch long, and that in one night. Now, I supposed that of course these lima beans, if planted in the ground, would grow. But my experiment seems to indicate that it is a mistake. It may be, however, that I did not let the beans get ripe enough. One thing that makes me think so is that the beans that were planted in this long row were perfectly white, and looked like ordinary kidney beans. On the strength of this I said in the price list that kidney wax beans were white, not remembering at the time that the small packet I planted to get my first ones started had a colored spot just about the eye. My lima beans, however, will be ripe and dry long before October. So, friend S., you and I are going to test the matter of getting two crops of lima beans in one year. If you succeed, the Kumerle lima bean *won't* be worth its weight in gold in 1890.

OUR PATCH OF JESSIE STRAWBERRIES.

Last fall, after our Early Ohio potatoes were dug, I had the ground cultivated very smooth and fine, and then covered with as much stable manure as we could well plow under. It was then plowed, harrowed, and marked out with our disk furrower, leaving wide deep furrows like paths. These paths were three feet wide from center to center. While the furrower was going over the ground, a wooden tooth was fastened temporarily so as to make a shallow groove in the center of each one of the raised beds. My idea was, that if strawberries were planted in the center of these raised beds they would not suffer so much from frost, because the paths or furrows would let off all the surplus water during winter. I think that strawberries, like wheat, are injured in winter because of a surplus of water standing on the ground. Remember, this ground is already well underdrained, but our clay soil is so slow in letting the water pass away, that I felt sure the above arrangement would help the matter of having the plants thrown out by the frost. Well, the mild winter may have had something to do with it; but as it was, not a plant in the whole 3000 was injured in winter. There are nine rows of the berries. Three of them are Sharpless, and the others Jessie. Strong plants were selected, and they were put in in the fall, with our transplanting-tubes; all runners being nipped, they of course made a good growth, and went down into the rich ground very securely. Not a plant died in transplanting, that I know of. You will remember that, in our list of plants, I have mentioned the Jessie as holding itself up out of the dirt. Well, we were greatly puzzled because this year the Jessie did nothing of the kind. Perhaps the plant might be excused for omitting this part of the programme when I tell you that the berries are, many of them, more like peaches than strawberries, so far as size is concerned. Another thing, we have heretofore supposed that the Jessie was a regular-shaped berry. This year they are broad, wedge-shaped, double, and in almost every respect just about like the Sharpless; in fact, everybody calls them the Sharpless, only they were ripe before a single one of the Sharpless had got its growth. They are so luscious that the robins, the hens — yes, even the rats, have gone to sampling them. We do not have many rats, but there were enough to make a start on one end of the Jessie berries. Besides the above enemies, the small boys of the establishment got to picking them, and eating them green by the pocketful before I knew it. Just as soon as there is a blush of red on one side of the berry they are very good to eat. My cousin, D. E. Fenn, of Tallmadge, O., has just paid us a visit, and he is a man pretty well acquainted with horticulture in all its branches, especially strawberries. He pronounced my patch of Jessies the finest thing in the line of a strawberry that he had ever seen in his life. Now, he is a comparatively near neighbor to friend Terry, and to Matthew Crawford besides. We are still picking off the runners and

keeping out the weeds, and that patch of strawberries is going to make a show before winter comes, I tell you.

We have Bubach and Haverland also, fruiting. They are much like the Jessie, only the Bubach is still larger both in fruit and foliage. In fact, it is immense all around. You know the Bubach is said to be the only successful rival of the Jessie. I expect to sell plants this fall. The Haverland has a better shape, but it is hardly as large. Both are exceedingly strong growers. I have just got four of the plants of the new Miami, introduced by our old friend J. D. Kruschke, one of the bee-fraternity, and a contributor to GLEANINGS some years ago. The Miami plants were very small, feeble ones, received late in the fall. They are now making an excellent growth, and the berries differ from any thing else I have seen, by ripening all over at once. There is not any red side where the berry is exposed to the sun. It is a beautiful red on all sides at once.

ALASKA PEAS.

We have succeeded in having a fine crop of peas by the first of June, when nobody else has any anywhere about. For several years I have been planting peas in February and March, but they did not mature any earlier than those planted a month later. I finally decided that some poorer ground might give us peas sooner. Well, the poorest piece of ground we have on our plantation is a little knoll facing the south. It looks and acts as if the surplus soil had been removed for some purpose years ago. In fact, it would not even raise grass; but the dry clay was visible the year round. I thought this would be poor enough for early peas, so I turned under some old well-rotted manure, applying it in the fall. This spring, before the frost was out of the ground, and as soon as the clay was dried out hard enough so it would rake up on the surface, I put in five rows of peas. As I supposed they would make only a feeble growth, they were planted only 18 inches apart. They came up as I expected, very quickly, on account of the sunny spot they occupied, sloping toward the south. When they were six inches high, I purchased five rolls of poultry-netting, with 1½-inch mesh, and only one foot wide. A stake every 25 feet held the netting just so the peas could reach the lower selvage edge. They "caught on" very soon, and my little patch of peas has been all the spring a pleasant thing to visitors. By the way, we can now furnish a strip of poultry-netting of the above dimensions, 150 feet long, for only 50 cents. Can you get any thing cheaper for early peas? We have picked about three bushels from this little patch, and there will certainly be six or seven bushels more. What do you think of it? Ten bushels of peas from a piece of ground about 10 feet wide and 150 feet long! The first of them sold for \$2.00 per bushel; but now we get only 40 cents a peck. As soon as the peas are cleared off I am going to try the early strawberries on this poor, hard, clay soil. They probably will not make very much growth, but I suppose they will bear

berries quite a little ahead of our highly manured plots.

MYSELF AND MY NEIGHBORS.

Incline your ear, and come unto me: hear, and your soul shall live; and I will make an everlasting covenant with you, even the sure mercies of David. —ISA. 55:3.

ONE Sunday morning our pastor changed places with a brother-minister in an adjoining town. I think I have before told you that I have a particular love for preachers. I believe I love all humanity; I love my fellow-men. I love to be with them, and I especially enjoy getting acquainted; but if there is any one class of people I love particularly it is God's ministering servants. I know they are criticised and found fault with; but never, since my conversion, has it ever been my lot to find a minister of the gospel who did not have a good deal that was lovable about him. Some of them have queer, odd ways, just as you and I have, and it may take a little charity for a man to get right well acquainted with them; but the single fact alone, that they have given themselves, heart and soul, to the cause of Christ, has never failed to draw me toward them. Well, when this new minister stepped into the pulpit I of course began to get acquainted. In his opening benediction I got a good deal acquainted. It was different from any opening service I had ever heard. I decided at once that the man was original. It made me feel as if we were a great family of brothers and sisters having family worship at home, around our own fireside. You may be surprised to have me say that I can not remember his text; and as our good brother has not furnished it in the following paper, I have had to substitute one of my own.

There were several points in the sermon, that interested me so particularly that I begged him to let me have that part of it; but although he had some written manuscript before him, he told me that the part I wanted had never been given before, and he was afraid he should never be able to give it again just as he did that morning. You see from this statement how much help it is to a speaker, and especially to a preacher, to have a good-sized, intelligent, and appreciative audience. He, however, promised to do the best he could, and here it is. Now, he wrote one page specially to A. I. Root, that he did not intend to have put in print; but I am going to take the liberty of printing it with the rest, just because it helps you so much to get acquainted with him. It is something a little aside from the sermon, and sounds like a few kind words spoken after he had got down among the audience—or, if you choose, just as he was shaking hands with A. I. Root and family. Now, I want to tell you, dear friends, that A. I. Root and family—yes, clear down to six-year-old Huber—are found, as a rule, occupying a seat close by the pulpit. I do not know how it comes that we always sit there; in fact, I do know that my good wife

has protested a great many times because I insisted on getting forward in such a conspicuous place. But there are several reasons why I like to be right there. In the first place, I like to be near the speaker, especially if, as I have said, he is also a *preacher*. And right at the end of the seat where I sit is a door that can be opened without making much disturbance when there is a lack of fresh air. It gets opened, too, I want to tell you, even if some of the elderly friends do look as cross as they dare look at A. I. Root. Now, then, friends, I think we are all ready to let Bro. Gammell talk to us.

Dear Mr. Root:—I hope you will find this inclosed copy about what you expected it would be. I send it along, with the prayer following it that, if you print it, it may do good to some soul waiting for some such message. You will remember to send me a copy or two of the magazine containing it. We have been reading from your books, and probably no family in the land got so suddenly acquainted with A. I. Root and his travels as we did in one day—Monday. Your account of that Sunday afternoon at Manitou reads like a chapter out of Augustine's Confessions. We enjoyed journeying with you.

Yours in Christ, S. D. GAMMELL.

Wellington, O., May 2, 1889.

A HUMAN INSTINCT.

An extract from an address to some bee-people at Medina, O., April 28, 1889.

You say the bee has instincts, but have not men instincts also? What do you call that frequent and most natural resort to prayer in presence of a momentous crisis in the personal experience, if it be not an instinct of the soul?

Blind Homer declared, a thousand years before Christ, "All men have need of prayer." I agree with him when I hear that the surgeon, about to perform an operation that might be fatal, laid aside his knife for a moment and fell on his knees with an appeal to almighty Wisdom and Goodness that his hand might be steadied and his stroke sure when a fellow-being's life was involved.

My agnostic friend, would you object if your surgeon should keep you waiting a moment before some dangerous service you had asked of him, that he might pray? Would you not hope that his mind and soul would at least recover poise and composure, and his success be more certain? As for me, that sort of physician would commend himself at once.

So, again, I agree with that old heathen poet I have quoted, when I read of the painter, Fra Angelico, how he would not put brush to canvas, nor mix the oils for his daily task, until he had prayed that his soaring genius might be visited with an inspiration from the Source of all beauty and splendor. No wonder that Ruskin can say of him, "By purity of life, habitual elevation of thought, and natural sweetness of disposition, he was enabled to express the sacred affections upon the human countenance as no one ever did before or since." Is it too much to claim that here we have an illustration of cause and effect, that this painter's success was in part dependent on his praying?

Once more, did not the astronomer Kepler respond to this instinct, when, in the midst of his discovery of celestial laws, filled with wonder and admiration at his vision of stellar harmonies, he cried out: "I

thank thee, O God, that thou hast permitted me to think thine own thoughts after thee"? And you and I, good friends, if we are true to our better selves, standing at the star-gazer's side and listening while he describes to us some raging cyclone in the sun, or a new volcano reddening the planet Jupiter's sky, or some other heavenly wonder, if we are true to our natural instincts we also shall thank God that he has taught men to use their lenses and tubes with such skill that they can see what he is doing in the star-depths, and think his thoughts after him.

Suppose further, that it is only a tradition that Washington was heard praying by himself in the wintry forest at Valley Forge in a strait of generalship, and that Stonewall Jackson, leading a charge, himself in the saddle, flung up his arms in momentary prayer to God; even if these be myths they reflect the thought of many minds, and the common expectation that such an act is becoming to the time and place. It is the general acquiescence in the blind bard's dictum, "All men have need of prayer."

Again, it is generally supposed that the times of Franklin and Jefferson and Paine were conspicuous for their skeptical tendencies. What, then, shall we say of the fact that the first act of the Continental Congress which met at Philadelphia, Sept. 6, 1774, was the adoption of a resolution that the Rev. Mr. Duché be desired to open Congress with prayer at Carpenter's Hall at nine o'clock? In this stress of statesmanship, men had need of prayer. Men are driven to it as a last and only resort, as shipwrecked sailors are driven to take refuge in the rigging and topmasts of their sinking ship. I was reminded of this the other evening when I heard what I will call "The Surgeon's Story." He was in charge of an army hospital in the late war, and received one day a wounded soldier, a mere boy, shot nearly to death. Day after day the doctor sought to reveal his dangerous condition to the lad; but his light laughing spirits would not take the plain hints and intimations of his medical attendant; and yet he was slowly, surely dying. One morning the doctor said, "My boy, I've tried to tell you that you could not survive this wound; that you must certainly die; but you wouldn't believe me; now I tell you plainly, that before noon you will be dead."

Again that stolid stare, that imperturbable spirit, that unresponsive mind, and the surgeon went away. But in an hour he was hastily called, and the now conscious and aroused boy broke out, "O surgeon! I know what you mean now. I must die; but what shall I do? I'm not prepared to die. O doctor! I can't die. My father was a minister, and my mother taught me to pray; but I've been a wild, bad boy. O surgeon! what shall I do?" And the good surgeon felt himself but poorly qualified, in his little knowledge of Christ, to give this dying boy an adequate reply, and could only stammer, with tear-filled eyes, "Your mother's religion, my boy; your mother's religion." What else have you to offer, my agnostic friend? What else but this? It is the natural cry of the soul in mighty emergencies, face to face with awful duties, face to face with the impenetrable mystery of death and eternity. It is the cry of the soul lifted up in prayer—the prayer learned, it may be, at mother's knee—to the eternal Goodness.

The bee, by instinct, knows where to find its honey and how to build its cell. Shall not the imperial

soul know where to find its joy, and how to build for itself an eternal mansion, abiding instant in prayer, following the supremest instinct of the god-like soul?

You are right, brother Gammell; I am sure you are right. When God endowed the bee and the lower forms of animal life with unerring instinct, he surely did not forget man, who stands at the very head of the animated universe; and he surely does not leave him in darkness, and alone, when these momentous crises come, as they do most surely come to us all, sooner or later.

Yea, though I walk through the valley of the shadow of death, I will fear no evil; for thou art with me; thy rod and thy staff they comfort me. — PSALM 23:4.

Thousands of times have I been comforted, and made to feel safe and at ease—yes, thousands of times has he helped me to be cool and collected when important issues were at stake. Dear brother, since you gave us that sermon, and since the foregoing was penned, one of the greatest calamities has come to us as a people, that ever tried men's souls since the settlement of America. Over ten thousand people were hurried to sudden death within one short hour. No doubt at such a time there was much praying; in fact, we have many records of the prayers that were offered up. And some of the newspapers have been in such haste to tear down the Christian religion that they have boldly declared that God did not hear or answer in this time of trouble. One newspaper even seems to delight in telling of certain people who discarded their Bibles, and refused to hear a word from their pastors, because God permitted such a thing to happen. Perhaps I am touching upon a subject too deep for me. Very likely I can not tell how I should behave myself under a similar trial; but, dear friends, if there be any among you who have been troubled by these newspaper accounts, please remember that God has never promised to exempt even his devoted followers from sickness and suffering, from accident and death. He has, however, promised to give us grace to meet all these things with courage and calmness and trust. Jesus breathed, with his dying breath, "Father, into thy hands I commend my spirit." Before the ordeal came, he did once pray that the cup might pass from him; but after he had risen above this human weakness, he met suffering and death in such a way as may well be an example for all mankind. Should I be overtaken by any such calamity, I hope and pray that I may have grace to pray as did the Son of God. When the question first came to me, I at once decided that those who prayed simply for longer life (or even that a loved member of their household might be spared a fate that seemed to have come to all round about them), had a wrong conception of God's promises; and in thinking over the matter, and mentally going over the Scriptures, the answer seemed to come to me, that in no place in the Bible have we the assurance that our lives shall be prolonged, in answer to prayer. The sun shines on the just and on the unjust; and sickness and accident

and death also come to the just and to the unjust. It is our duty to save our lives, where we can consistently, for the good of others. It is our duty to be careful of human life; but all of our prayers should take in the thought, whether expressed in words or not, "Nevertheless, not my will, but thine, be done." He who starts out to be a follower of Christ Jesus must not expect that, because he does so, he is to be exempt from the ills of this life; in fact, it does sometimes seem as if Christians were called upon to suffer and bear even *more* than the people of the world. The Ashtabula disaster of years ago seemed to indicate very plainly that God does not propose to save even his *devoted* followers from the effects of a terrible accident. In the case before us it seems to have been rather the acts of man than the acts of God; but when we come to earthquakes, cyclones, cloud-bursts, and the like, we are forced to conclude that God has some very wise and good purpose in permitting these sad things. It may be that we need to be reminded very often of the uncertainty of life, and of the fact that it is futile for us to propose putting off the time of reform until death shall be near. I do believe that it is well for us to know that death may come at any hour, unheralded and without warning. Our whole nation once prayed that the life of a president might be spared. It seemed to us that it *must* be for the best that he should be spared. His life was not spared, however, and I feel certain that none but a poor *mistaken* Christian lost faith in God simply because our president died. Suppose, by way of illustration, we should quarrel with the great Creator because his plans were not in accordance with our poor weak human judgment. If we should decide that this world or this universe is a poor one, and badly managed, how much can we do toward finding a better one? Jesus once asked his poor humble followers if they too were going to be offended, and turn away from him. Peter, by a sort of instinct, such as our brother has mentioned, rushed to the truth of the matter at once when he said, "Lord, to whom shall we go? thou hast the words of eternal life." Now, then, if we shut up or throw away our Bibles, what then? Where shall we find comfort? Is there anything else that will sustain and cheer us in the dying hour? We are told that a mother, at the last crisis, put her children, one by one, on floating fragments—fragments that would buoy them up, probably, but would not sustain her own weight; then with a prayer to God, and with encouraging words to the children that God would take care of them in the flood and in the darkness, she set them adrift. They were never found alive. Did the poor, almost distracted mother make a mistake in commending them to Him who holdeth the winds and the waves in the hollow of his hand, and who heareth even the ravens when they cry? She might have made a mistake in assuring them that they would be spared from death, but surely not in trusting even her little four-year-old girl to the tender mercies of the Father above, when the little one

called back in the darkness. "Mamma, I am not afraid." The cold corpse of her darling was afterward found, and skeptics have tried to make it appear that the poor mother was wrong. But who shall say that God did not take that little one who, with childish lips, said she was not afraid, into his care and keeping, without a pang? We are not told in God's holy word that we shall be spared from death; but we *are* told that

Jesus can make a dying-bed
Feel soft as downy pillows are.

As we go to press, I feel to rejoice that our own State of Ohio has done nobly for the relief of the sufferers; and I am glad to say that a subscription was started in our own little town of Medina, even on the Sabbath day, and that the money subscribed went as speedily to the sick and suffering as our modern methods of swift travel could carry it. Jesus told us, that "in the world ye shall have tribulation;" but he also says, "I have overcome the world."

THE VAN DEUSEN METAL CORNER.

FRAMES AT FIXED DISTANCES; REVERSIBLE FRAMES, ETC.

EDITOR OF GLEANINGS:—It is with pleasure that I answer your inquiries regarding the VanDeusen metal-cornered frame. Eight or nine years ago I read Quinby's "New Bee-Keeping," and became enthusiastic over the merits of the closed-end frame. I gave it a trial, but I never could handle it without killing a good many bees. My bees at that time were blacks and low-grade hybrids, with the two worst traits of such bees fully developed—that of hanging in great bunches on the corners of the frames when lifted from the hive, and of being very free with their stings when pinched a little. With Italians I presume the crushing of bees with such frames is reduced to a minimum, for they do not get in the way as the blacks do. With hooks on all four corners, the Quinby closed-end is certainly an almost perfect reversible frame, if we lay aside the objections mentioned above. Not liking the loose case I reduced the depth of the frames to seven inches and dropped them into an ordinary hive, supporting them on hoop-iron strips nailed along the lower edge of the ends of the hive. Notwithstanding these frames were wedged from the side, the propolis soon made them difficult to handle, and they are certainly as perfect bee-killers as one could possibly invent; for when a frame is pushed down, as described by Mr. Heddon on page 390 of *GLEANINGS*, May 15, 1889, it is impossible to avoid crushing bees on the frame-support at the bottom. I write in present tense, for one of those hives is still in use in my yard; and several times every summer, after reading how easy it is to handle the closed-end frame if one only knows how, I go and try to learn. To be more sure of success, I have had a colony of splendid Italians in the hive for nearly two years; but they get under the end-bars by twos, threes, and half-dozens; and as the frames go into place, one never fails to hear the bones crack. If the Heddon hive is made with a metal rest for the frames, I consider it a waste of time to discuss the question of easy manipulation of frames; it must be a manipulation of hives.

In all my experiments with frames there were two points kept constantly in view. For many reasons I desired a reversible frame; and because my bees were to be moved frequently I had determined that the frame should be fixed firmly in its place in the hive. The closed end frame answered these conditions, but its objectionable features outweighed its good points. At this stage of my investigations you illustrated the VanDeusen metal corner in *GLEANINGS*, and described the hive used by Mr. O. J. Hetherington, of East Saginaw, Michigan. I was favorably impressed with the device; and after experimenting with it a little, I began putting all my new swarms into hives supplied with the Hetherington frame. I am more than pleased with its working. It is more easily handled than any other frame in existence, and it is impossible for the bees to fasten it with propolis because its bearings are all metal, and are mere points. From each corner of the frame, two metal points project $\frac{3}{8}$ of an inch, spreading slightly until they reach a width of an inch and a half, scant, at the widest part. The $\frac{3}{8}$ projection spaces the end of the frame away from the end of the hive, and supports the frame by resting upon a strip of metal nailed to the lower edge of the end of the hive. The spread of the projections (or, rather, shoulders on the projections) spaces the frames from each other and from the sides of the hive. In lifting out a frame or returning it, it is impossible to roll bees between the end-bars and the ends of the hives; and when moving frames closer together the four conical shoulders make it a difficult matter to crush a bee between the combs, as is so often done with suspended frames. I can handle these frames much faster than I can suspended frames; and after hiving a new swarm, the hive can be carried to any part of the apiary, and put down with the assurance that every frame is in its proper place. To move an apiary, it is only necessary to shut the bees in the hives, and they are ready to be loaded on the wagon. I do not see how a better reversible frame could be made; for, top and bottom being alike, it makes no difference which side is up; the hives may even be stood on end for examination; a point of considerable importance when one is in a hurry.

I am not sure but I have one objection to this metal corner; and that is, that it spaces the combs $1\frac{1}{2}$ inches from center to center. As yet it has given me no trouble on that score, but I believe I should like it better if the spacing were only $1\frac{1}{8}$ inches. The wide spacing is an invitation to the bees to store rather more honey in the brood-chamber than I want there; but by shaving off the elongated cells and reversing the frames I have managed the matter very satisfactorily. With a large number of colonies this would be too much labor, and I have about arrived at the conclusion that I want the spacing reduced to $1\frac{1}{8}$ inches.

Any one using a suspended frame can easily change to this without buying new frames, if the ones he has in use are one inch shorter than the inside of the hive. Saw off the projection of the top-bar, nail a metal corner on each corner of the old frame, and a folded piece of sheet iron on the bottom edge of the ends of the hive, and the work is done. The expense is but trifling, and it makes a hive that, in my estimation, is far in advance of any other now in use.

I may as well mention here, that I use a frame $16\frac{1}{2}$ inches long and 7 inches deep, outside measure;

and it might be that, in handling a deeper frame of this kind I should find objections to it that my shallow frame has not developed. Two of my neighbors who have heretofore used the same frame I am now using have this year added one inch to its depth, and I shall have the opportunity of observing its workings.

Z. T. HAWK.

Audubon, Iowa, May 27, 1889

I am very glad indeed to get the above report; in fact, I have long wondered that we didn't hear more from that frame. I think, however, you will not like frames spaced at 1½. I have tried it pretty thoroughly; and unless your combs are absolutely straight, like a board, even when filled with brood and capped over, you will have a great deal of trouble if you undertake to move frames from one hive to another, or even reverse or change ends with any frame. The combs will touch in places, or so nearly touch, that the bees can not get through; cells will be left vacant, brood will be destroyed, and constant labor will be involved in cutting down and building out—labor for the bees. The frame you have, I think will work better with the VanDeusen corners than a deeper or larger one.

RECENT DEVELOPMENTS

CONDUCTED BY ERNEST R. ROOT.

THE HETHERINGTON REVERSIBLE FRAME.

WHANCING to observe that our friend Z. T. Hawk was using the frame mentioned above, I wrote to him asking him to prepare an article for GLEANINGS, setting forth his views and experience with reference to closed-end frames, and the Hetherington reversible frame in particular. He has done so, and the article above covers my own feelings in the matter so perfectly that but little further comment is necessary. While I recognize some of the very decided advantages of the closed-end frame, I have been no less sensible of their defects, both from a theoretical and practical standpoint. The more I have been thinking of the matter, the more I feel just at present that the Hetherington reversible frame comes as near filling the bill as any thing that has ever been gotten out. It not only retains most if not all the advantages of the closed-end frames, but it obviates some of their most serious defects, so it seems to me; and friend Hawk, from a practical standpoint, you will notice, is of the same opinion. For the production of comb or extracted honey, in any case where the colonies are to be moved to any considerable extent, to and from out-apiaries, it seems to me (although I may change my mind very shortly) that something better than the ordinary suspended frame is needed. I have not forgotten the advantages of the hanging frame, such as the lateral movement, spreading of frames in winter, and contracting again in the spring. By turning to Question 117, April 1, page 270, where the problem of wood bearings versus metal rabbits is involved, with reference to the hanging frame, a great

majority of the respondents prefer the wood bearings. Why? For the very reason that the hives can be moved about without special means for holding the frames at fixed distances; but to get this feature it is necessary to incur considerable inconvenience. If the frames are fixed with propolis, they must be removed necessarily with difficulty, to say nothing of an occasional snap, and, of course, disturbance from the bees, and more or less stings. I do not believe that apiarists in general would tolerate the regular closed-end frames, although I do not deny the fact that some of our best and most extensive bee-keepers use and prefer them; but I do think that a frame at fixed distances is a thing we need, providing that we can at the same time secure perfect mobility. Perhaps the principal reason why we dropped the Hetherington reversible frame was because it could not be adapted to the Simplicity body, with its beveled edge. This frame, however, will fit the new Dovetailed hive with but very little alteration. A strip of strap iron or heavy tin, nailed to the bottom inside edge of each end of the hive will form the support for the Hetherington frame. This support will not interfere with hanging frames. To give you a better idea of the reversible frame, I reproduce here an engraving which appeared on page 332 of GLEANINGS for 1884.

THE METAL-CASTING REVERSIBLE FRAME.

1. Metal corners attached to a wide frame, showing how it can be used without any top-bar.
2. Brood frame, with metal corners attached to each corner.
3. Metal corner detached from the frame, showing nail holes.
4. End-bar of wide frame, showing cuts necessary to take in metal corner.
5. Metal corner in place, inserted in a saw cut in the end bar.
6. End-bar of wide frame, showing cuts necessary to take in metal corner.

The figures 2, 6, and 5, will make the idea plain. No. 5 we nail upon the frame, as shown in figure 6. The casting not only spaces the frames the proper distance apart, but keeps them at a proper distance from the ends of the hive. As the place of contact is a mere point, propolis can play no part. I have tried these frames considerably, and know of nothing that reverses any prettier or nicer than these; and when they drop down upon the strap-iron support, there is but very little chance of crushing bees. I do not believe it ordinarily pays to go to the expense of reversing; but if we can get reversing with *fixity* of distances at the same time, well and good. All of the combs in the Hetherington reversible frame are filled out nice and full, and will almost do to ship without wires. We shall not at present offer these frames for sale; but what I want to know is, have any others of our subscribers tested it? If so, let us hear from them. What I want to know particularly is whether I am on the right track for something better.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, JUNE 15, 1889.

He that planted the ear, shall he not hear? he that formed the eye, shall he not see?—PSALM 91: 9.

HONEY MARKET.

By glancing at the honey market, for a few numbers back, we observe that the old honey has been nearly cleaned out, and that there is a demand for new honey. After the old stuff has been all moved off, we shall hope for better prices, even with a good honey-flow.

DZIERZON.

The following item, from the *Revue Internationale*, of Nyon, Switzerland, will be of interest to our readers:

Dzierzon, born in 1811, is still living a retired life in Brieg, Silesia, where he has been for several years. The University of Munich has awarded him the diploma of Doctor of Philosophy, as a reward for his numerous scientific works, and for his theory in regard to parthenogenesis.

THE BUSH LIMA BEAN.

MAY be you think I have got over my enthusiasm; but I tell you, I have not. A good many thousands of the Henderson bush lima beans are now above ground; but, like the seed they sprang from, the plants are so diminutive they look like Lilliputian beans. Not so with the Kumerle. It looks exactly like a good, strong, healthy lima bean. It is true, it may climb poles, as friend Henderson has suggested; but if they do undertake to climb poles, our friend Thorburn had better climb a pole too, or else some bushy tree, where he can get himself out of sight.

EXTENSIVE BEE-KEEPERS.

As we have said many times before, our space is crowded; but we always have lots of room—in fact, we make it for bee-keepers of large experience, and those who own colonies by the several hundreds. We are constantly striving to make improvements in various ways in GLEANINGS; and our latest effort is to secure articles from the most extensive bee-keepers in the land, on live topics. We take pleasure in the fact that we have added to our columns such men as A. E. Manum, S. I. Freeborn, and others. Those who are large bee-keepers, and, as a matter of course, successful, can hardly fail to give us some practical hints.

ANSWERS TO QUESTIONS FROM THE A B C CLASS.

It will be noticed elsewhere, that we have started a department for the A B C class. Most of the questions are asked by beginners. Some questions, however, are asked by the veterans, and are answered in this department because they are not only of general interest, but they are of vital interest to beginners. Although our A B C book is very comprehensive, it can not, from the nature of the case,

cover all things under all circumstances. It will be observed, that the question itself is omitted, the query being implied in the answer. We do this, because it saves space, because almost all of the answers imply the question, and hence the specific wording of the question before would be not only useless but unnecessary.

THE ENCYCLOPEDIA BRITANNICA—A CORRECTION.

SINCE our article on page 443 of our last issue was printed, concerning manufactured comb honey, as published in the American Supplement of the *Encyclopedia Britannica*, we learn that the J. M. Stoddard Co., Limited, of Philadelphia, were not the publishers of the Supplement in question, containing the slander on the bee-keeping industry. As Dr. Nysewander, who furnished us the facts, did not give the name of the publishers, we consulted an American edition of the *Britannica*, and found that the publishers were the J. M. Stoddard Co., Limited, Philadelphia. Supposing them to be the only publishers of the American edition, we concluded a little too hastily that they were responsible for the false statement. We here desire to publicly exonerate them from all connection in the matter. We have since learned that the publishers of the Supplement are Messrs. Hubbard Bros., 723 Chestnut St., Philadelphia, Pa., and have written them.

OUT-APIARIES AND MIGRATORY BEE-KEEPING.

We are glad to note the disposition on the part of our correspondents to discuss the matter of out-apiaries in all its bearings. There is more to be developed in this line than we are perhaps aware. Migratory bee-keeping, a kindred department of the industry, will doubtless receive more attention in the future. This fact has been proven over and over again; namely, that often a difference of two or three miles makes a very decided difference in the supply of nectar. H. R. Boardman, of East Townsend, O., says in some of his out-apiaries last summer his bees were almost on the verge of starvation; while two or three miles away, in another apiary, bees were very busy storing surplus. Migratory bee-keeping means moving bees to and catching any flow of honey which may suddenly develop in any locality where there are but few bees. Scale hives, located in several localities, with some one to report immediately any favorable change of the pointer, would keep the apiarist posted. Who can give us some experience in this line? Perhaps H. R. Boardman will favor us with an article on this subject.

CHILLED AND FOUL BROOD; HOW TO DISTINGUISH ONE FROM THE OTHER.

WITHIN the last few days, during the damp cool weather, a great deal of chilled and foul brood has been reported, and we have had a good deal of the former. Quite a number who have written to us in regard to their discovery have come to the conclusion rather hastily that they had the real foul brood, when the reported symptoms showed that they had only chilled brood. While foul brood is getting to be more and more prevalent, we fear, in the country, most of the alleged foul brood is only chilled, and, of course, not infectious. Perhaps we should remark right here, that chilled brood, in a great many points, resembles the virulent form. The former may be recognized by the following: A cold spell of weather comes on; the bees contract the cluster, inside of the outside limits of the brood,

Sometimes one or two frames are left high and dry, so to speak. The heads of the unsealed larvae in these combs will first turn black. The grub itself gradually sinks down; and after a time, unless the bees carry it out, it will turn to a grayish pulpy mass. If still neglected by the bees, it will assume a yellowish color; but, unlike foul brood, there is no ropiness. The characteristic brown color, as well as the glue-pot odor, is also absent. The capings are sunken and are often perforated. We are afraid that there are some who have unwisely concluded that they had foul brood, and have gone to the expense of treating chilled brood, for the virulent type. Some of the alleged specifics, we fancy, such as coffee, sulphuric acid, etc., have had to do with only chilled brood. Of course, this will disappear of itself; but the coffee and sulphuric acid get the credit, and Brown is offended because we have no faith in his remedy.

MARKETING OUR STRAWBERRIES, ETC.

At this date, June 13, strawberries are ripening pretty fairly; but I am pleased to tell you that they go off just as quick as they are ripe, at 15 cents a quart. It is true, berries are sold around us for 10 cents a quart; but I will tell you some of the reasons why we get 15 cents. The picking is all done by the school children, before school in the morning and after school in the afternoon. They are picked, and carefully placed in new pint boxes, made by the Disbrow Manufacturing Co., Rochester, N. Y. We give good heaping measure, and most of the berries are great big ones. Those picked at night are placed on the market-wagon, the wagon being placed in the fruit-house. Well, instead of shutting the building up with doors, both the north and south ends are simply closed with wire netting, so the air has free access. The little boxes of berries are placed 16 in a box, made expressly for them (these baskets are figured in our book, *What to Do*). The wagon starts out before 6 o'clock in the morning. The boys also start out to pick berries about the same time; and by school time the wagon is generally sold out, and comes around and collects the berries just picked; so you see we can tell our customers, "These berries were picked this morning." We usually get the pint baskets back again; but if it is not convenient, we let them go with the berries. Another thing that makes them sell is the extra large size. Why, it is almost like eating peaches to take one in your hand. Some of the farmers in the vicinity of Medina are complaining that they can not make any money by raising grain crops, and so they have started in on tobacco. It takes just as much manure and cultivation to raise tobacco as it does to raise strawberries. One kills, and the other cures. Yes, even Christian people are engaged in the tobacco-traffic. I asked one of the pastors, when told that his people were engaged in raising tobacco, what professing Christians had to say for themselves. He replied, "Their only plea is, 'There is money in it.'" Woe betide the follower of Christ when he gets on such ground as that. "Seek ye first the kingdom of God, and his righteousness, and all these things shall be added unto you."

BAD WEATHER.

LETTERS from all parts of the country mention the effects of the bad stormy weather. Many say their bees are starving; others, that there is no honey coming in, and colonies are liable to starve.

Within the last few days, the weather (June 13th) has so materially changed for the better in our locality that we hope that this discouraging outlook may soon be reversed. In fact, we are already in receipt of reports saying that honey is beginning to come in at a good rate.

SPECIAL NOTICES.

COPPER TEA-KETTLES AND BOILERS.

Since the collapse of the French copper syndicate, and the consequent decline in the price of copper in all its forms, articles manufactured from copper can now be bought at lower prices than for some time. We have accordingly put in a stock of planished copper tea-kettles and wash-boilers, which we can furnish at the following prices:

No. 8, copper tea-kettles,	\$1.50 each;	\$12.50 for 10.
No. 9, " "	1.75 each;	13.50 " 10.
No. 8, " " boilers,	3.50 each;	30.00 " 10.
No. 9, " " "	4.00 each;	33.00 " 10.

These are all tinned inside, and planished bright outside. The boilers include a tin cover. You may have the tea-kettle nickel-plated outside for 30 cts. each more. If carefully handled, copper utensils should last a lifetime, as they will not rust out like tin, nor chip off like agate or granite ware. They are also chemically safe to use.

DECLINE IN PRICE OF WIRE NAILS.

The manufacturers of wire nails having adopted a new list of prices, making important changes, we also change our prices accordingly. You will notice, by comparing our new table below with the old one published in our catalogue, that, on all sizes there is a decline in prices, and this is especially noticeable in the very small sizes. You notice, also, we introduce a new column, giving price of 25-lb. boxes, as we now keep in stock both 25 and 50 lb. boxes, which go at the same rate. Taking the prices right through, there is a marked decline in price.

PRICE LIST OF FINE FLAT-HEAD WIRE NAILS.

The $\frac{1}{8}$, $\frac{3}{8}$, and $\frac{1}{2}$ inch are also put up in $\frac{1}{2}$ -lb. packages, at 15, 12, and 10c per package.

Length of Nails.	No. of Nails per lb.	Size of Wire.	Wgt of 5-cent Pkgs.	Price.				
				1 lb.	10 lbs.	25 lbs.	50 lbs.	100 lbs.
$\frac{1}{8}$ in.	17,777	No. 21	1 oz.	25 ct.	\$2.40	\$6.00	\$12.00	\$22.00
$\frac{3}{8}$ "	10,000	" 20	2 "	20	1.80	4.00	1.20	1.20
$\frac{1}{2}$ "	7,500	" 20	2 "	18	1.60	3.40	12.80	12.80
$\frac{3}{4}$ "	4,269	" 19	4 "	15	1.30	2.75	10.40	10.40
$\frac{7}{8}$ "	2,750	" 18	4 "	13	1.05	2.15	8.00	8.00
1 "	2,350	" 18	4 "	12	1.00	2.00	7.10	7.10
$1\frac{1}{8}$ "	2,000	" 18	4 "	11	.90	1.85	6.80	6.80
$1\frac{1}{4}$ "	1,200	" 17	8 "	10	.80	1.65	5.90	5.90
$1\frac{3}{8}$ "	760	" 16	8 "	9	.70	1.50	5.30	5.30
$1\frac{1}{2}$ "	500	" 15	8 "	9	.70	1.50	5.30	5.30
2 "	350	" 14	8 "	8	.70	1.40	5.00	5.00
$2\frac{1}{4}$ "	238	" 13	8 "	8	.60	1.30	4.70	4.70
$2\frac{3}{4}$ "	164	" 12	8 "	8	.60	1.25	4.40	4.40

Five lbs. will be charged at the 10-lb. rate; 50 lbs. at the 25-lb. rate. By mail, 18 cts. per lb. extra for postage and packing.

KIND WORDS FROM OUR CUSTOMERS.

Your Dovetailed hive can not be surpassed for workmanship. Freight charges were very moderate, being only \$1.22 for 295 pounds of stuff. Sassafras, Md., June 2, 1889. R. J. TOWNSEND.

THAT WHEELBARROW.

The goods you sent me came in due time, and I wish to say I am very much pleased with that wheelbarrow. It is so light and yet so strong, and runs so easy, it is ahead of anything in that line I ever saw. The other things are all right. Greene, Ia., June 2, 1889. GREEN R. SHRER.

Wants or Exchange Department.

Notices will be inserted under this head at one-half our usual rates. All ads intended for this department must not exceed 5 lines, and you must say you want your ad in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale can not be inserted under this head. For such our regular rates of 20 cts. a line will be charged, and they will be put with the regular advertisements.

WANTED.—Any one that has a book suitable for a mission Sunday-school, and would like to donate the same, to send it by mail to 13ftdb GEO. E. HILTON, Fremont, Newaygo Co., Mich.

WANTED.—To exchange a complete apiary of 25 colonies choice Italians and all needed fixtures for a 50-in. bicycle or offers, a rare bargain. 13d H. C. CRAGG, Groesbeck, Hamilton Co., Ohio.

WANTED.—To exchange 250 colonies of bees, for horses, mules, wagons, buggies, and 4 h. p. engine, or any thing useful on a plantation. 21ftdb ANTHONY OPP, Helena, Phillips Co., Ark.

WANTED.—To sell or exchange, Italian bees and queens, and supplies. Address OTTO KLEINOW, 4ftdb No. 150 Military Ave., Detroit, Mich.

WANTED.—To exchange old copies of GLEANINGS IN BEE CULTURE for bee-keepers' names and addresses, plainly written. I will send 3 copies (as long as they last) for each half-dozen names sent to me from anywhere in Nebraska or Dakota. I will not agree to send any certain number from 1879 to 1888. J. M. YOUNG, Box 874, Plattsmouth, Neb.

Black and Hybrid Queens For Sale.

Black and hybrid queens for sale, 30 and 50 cts. respectively. J. A. KIME, Fairfield, Pa.

FOR SALE.—Two black and 10 hybrid queens at 25 and 35 cts. A. W. SPRACKLEN, Cowden, Shelby Co., Ill.

I have a few hybrid queens which I will mail for 35 cents each. S. P. YODER, East Lewistown, O.

Now ready to mail, Italian-hybrid queens at 30c each. N. A. KNAPP, Rochester, Lorain Co., O. 13 14d

Black and hybrid queens for sale at 20 and 25 cts., respectively, by JAS. MCNEILL, Hudson, N. Y.

Hybrid queens for sale, of this season's raising, and prolific, 35c each, or 3 for \$1. Safe arrival guaranteed. J. P. POOLE, Russellville, Ark.

Having purchased a large apiary of choice black and hybrid bees, I will sell the queens at 20 cts. and 30 cts. respectively. OLIVER FOSTER, 13ftdb Mt. Vernon, Linn Co., Iowa.

FOR SALE.—Three mismatched Italian queens, 35c each. Lot for \$1.00, CHAS. MCCLAVE, New London, Ohio.

Vol. XVII.

JULY 1, 1889.

No. 13.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.99; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries NOT of the U. P. U., 42 cts. per year extra.

OUT-APIARIES, NO. X.

VENTILATION FOR BEES WHEN HAULING.

ONE day I was hauling, among others, a very strong colony of bees from home to the Wilson apiary. The day was very hot, and I did not get started till pretty late, and was delayed by some business in the village as I passed through. When the entrance to the hive was opened, after reaching the Wilson apiary, the bees of this strong colony rushed forth in a body, not taking wing—they couldn't take wing—but spreading out on the ground until they covered a distance of perhaps three feet from the hive. I should think about a fourth of the colony were on the ground—perhaps not so many. The rest of the bees didn't crawl out—dead bees don't. Those that did come out soon died. The whole colony was a steaming, wet mass, and the combs were soft and broken down. Fifty colonies lost in wintering were not mourned so much as that one colony. It seemed a case of deliberate murder.

Bees don't need such an immense amount of ventilation; but what they do need, be very sure you give them, or they will smother to death. I have, in a few cases, hauled bees in the middle of a hot day, in the middle of summer, in which case I gave them the usual ventilation at the entrance and a covering of wire cloth over the entire top, a space of three or four inches being between the tops of the frames and the wire cloth. That was probably more ventilation than they needed, but the excess of ventilation did no hurt. For the usual hauling, spring and fall, I give no other ventilation than the ordinary entrance covered with wire cloth. Until recently the entrances to my hives were $15\frac{1}{2}$ x $\frac{3}{4}$, making a space of nearly 6 square inches; but now they are $15\frac{1}{2}$ x $\frac{1}{2}$, making about 8 square inches,

The 6 square inches seemed to answer very well, but 8 are probably better. Perhaps smaller hives would need more ventilation. In any case, be sure that you give ventilation enough. Don't start out with a full load of bees, giving only 6 inches ventilation, till you have tried one or two, and know that 6 inches is enough for you. Possibly 12 square inches may be none too large space for ventilating your hives. At any rate, too much ventilation will do no harm, and the only reason I have so little is the simple matter of convenience. I formerly attached to the front of each entrance a wire-cloth portico, which answered the purpose excellently, but I now have a simpler and easier way. Take a stick about as long as the width of the hive, an inch wide, and $\frac{3}{4}$ thick. Take a piece of wire cloth about two inches wide, and as long as your stick, and double it lengthwise. Lay the wire cloth on the stick, and fasten it on with three or four double-pointed tacks, running them across the grain

WIRE-CLOTH STOPPER FOR ENTRANCE, SHOWING THE SIDE THAT GOES NEXT THE HIVE.

so as not to split the stick, letting the doubled edge project over the edge of the stick $\frac{3}{4}$ or $\frac{1}{2}$ inch, whatever the size of the entrance. A single thickness of wire cloth would answer as well or better than double, but for its raveling out at the edge. A $1\frac{1}{2}$ -inch wire nail driven into each end of the stick holds it fast on the hive. The nail is driven in only a little more than half its length, so it can be easily drawn out with a claw hammer. After the nail is drawn in a sufficient depth, it is bent over so there is no danger of the stick slipping back on the nail.

I need not say that such a stopper is not suitable for all hives. For hives with loose bottom-boards, there might be special bottom-boards made, to be used only in carrying, in which should be a liberal allowance of wire cloth.

C. C. MILLER.

Marango, Ill.

Friend M., a good many of us have had experience with bees so nearly smothered that they crawled out of the hive and off through the dirt, in every direction. Now, if they are allowed to go off through the dirt it is a dead loss, for they are dead bees. But there is a way of saving them. I have given it with full particulars in our little book, "Mr. Merrybanks and his Neighbor." I have saved bees so nearly suffocated they were wet and daubed with honey, a great many times, in the same way. Our boys once put up some nuclei during very hot weather. The combs were heavy with honey, and the bees were gorged. Bees from the apiary soon began hanging around the wire cloth, and making a bother; and to keep them away, somebody set them inside of a chaff hive and laid a cover on, thinking that the ventilating holes in the cover would give them air enough. Not so. When I found them they were almost too hot to touch, and dripping with honey, having that black sticky appearance. I took a nucleus under each arm and rushed to the apiary, and found two queenless colonies in chaff hives. I raised the cover and set a nucleus inside of each one. As soon as I pried off the wire cloth, the bees boiled out all over the sides of the hives, too wet to take wing; but before they could get outside of the chaff hive the cover was put on. Of course, the brood-combs to the chaff hives were uncovered. Now the sticky bees could not get to the open air without crawling through a good populous colony, and I expected that this good populous colony would lick them clean and reconcile them to staying indoors before they had a chance to find an entrance. It turned out exactly as I expected. Every bee, including the queen, had his face washed and hair combed, and looked quite respectable by next morning; but they had a black, shiny look that they never got entirely rid of. None crawled out of the entrance to go off and die, that I could discover, at all. After you have got a good quantity of bees, of course it will take a good strong healthy colony to slick them all up. During hot weather we place a sheet of wire cloth over both top and bottom, and have the bottom so arranged that it can not be set on the floor so as to cut off ventilation. With plenty of air, the hottest weather does no harm.

WHAT CAUSES SWARMING?

FRIEND DOOLITTLE TAKES SOME EXCEPTIONS TO DR. MILLER'S INTERPRETATION OF FRIEND HASTY.

IT was with no little interest that I read the article by Dr. Miller, found on pages 441 and 445 of GLEANINGS, in which he tries to interpret what friend Hasty says about what causes swarming, in a most singular way, which interpretation is fallen in with by the editor, to a certain extent at least. Apropos of this I find an article in

the June *Guide*, written by the editor, in which he says, "If from any cause the food secreted by the nurse-bees is more than is required to feed the larvæ and queen, it is stored in abundance in certain cells which become queen-cells, and hatch queens. The capping of the queen-cells, or closing the doors to these storehouses for the food secreted by the nurse-bees, causes a commotion in the hive which results in swarming." Dr. Miller confesses that he "had never thought of just that reason" before, and for this reason he is excusable for being "taken in" so easily. Let us see what there is against accepting such a theory as that interpretation of Bro. Hasty's words by the doctor, and that brought out by friend Hill, in the *Guide*. In the first place, "these storehouses" (queen-cups) are built weeks before any food is placed in them, and long before the hive is filled with brood, and also when the unsealed brood largely predominates over that which is sealed, this showing that preparation for swarming is commenced long before the nurse-bees think of having more chyme in their stomachs than they have use for; showing, also, that preparations are being made to "multiply and replenish the earth" nearly as soon as the assurance of something for the sustenance of a new colony is warranted by the blooming of the first flowers. Now let us watch these embryo queen-cells and see what becomes of them. When the colony gets a little stronger, and are yet spreading their brood far more rapidly than at any other time in the season, so there is no cramping of the unsealed brood as yet, for the same has not yet reached the outside of the brood-nest, we find the queen placing eggs in these "storehouses," yet so far there has not been a particle of food stored in them, nor will there be till these eggs are about to hatch into larvæ. At this time the bees begin to feed these larvæ, destined to become queens, the same as they do those in the worker-cells, gradually increasing this food, till at the end of 48 hours they do assume the appearance of being storehouses; yet in this, no one, it seems to me, can see any thing but a plan to perfect the queen larva according to the laws which govern the bees, if they will look at it in a reasonable light.

Again, according to the old adage that "corn will tassel out at about such an age, even if the stalks are not six inches high," we see weak colonies of bees making preparations, and swarming with these "storehouses" well filled with royal jelly, when the hive is scarcely three-fourths full of brood, half of which is in the unsealed state. I have so repeatedly had these weaker colonies of spring swarm, that I long ago gave up the idea which I used to entertain, that a part of my colonies were so weak that they would not swarm.

Once more: We have had a very peculiar season here in Central New York this year, in which something has happened which I never knew to happen before to so great an extent as it has done this year. Prior to May 20th we had the most splendid spring for bees which I ever saw, and brood-rearing went on at a lively pace, till, at the date above referred to, all of the stronger colonies had their hives from two-thirds to three-fourths full of brood. With the 20th of May came a rainstorm which kept the bees in their hives for nearly a week, at the end of which it became so cold that ice formed in places a quarter of an inch thick. The cold kept on to a greater or less extent, together with rain, rain,

nearly all of the while (only now and then a pleasant day appearing), till June 12. At this time there was little in the hives save eggs, some nearly mature brood, and a hive pretty well filled with young bees which had hatched from brood which was in the cells on May 25, for brood-rearing was partially kept up for about a week after it began to rain. With June 12th came warm weather with sunshine; and as the rainy weather had brought on the white clover to an unusual extent, all colonies were as "busy as bees" in gathering the nectar which now began to be secreted by the clover, while the brood in the egg and larval form exceeds at this writing (June 18) any thing I ever saw before. Now, if our friends Miller, Hill, and Root were correct, that the accumulation of larval food was what caused swarming, the bees should not think of swarming now (but should have done so about May 28, when there were few or no larvæ to feed); for now there are apparently two larvæ to "one food," yet some of the strongest colonies have eggs in the queen-cells, preparatory to the issuing of swarms in the near future.

While the outlook before us is not good for honey, inasmuch as the brood which should have been in the hive, but was not, between May 20th and June 10th would have been the bees to gather our honey from basswood, still this poor outlook for honey has given a chance to prove the fallacy of this theory, that a surplus of chyme is the prime cause of bees swarming. How much easier for Dr. Miller to accept friend Hasty's words on page 460 ("how can young people be prevented from trying to set up a new domicile?") as applicable to the cause of swarming, rather than try to make out that there is some other cause for it than that implanted in the bees by the Creator of all things! Only as man interferes with the normal condition of the colony to so great an extent that their plans are all frustrated, can swarming be kept under our control; and, as I said on page 460, I believe that such frustration is against the best interests of the apiarist who is working for comb honey. Friend Cook thinks that I am too positive (GLEANINGS for June 1st, page 446) in answering query 125. I would ask friend Cook if we who believe in the Master's teachings have not a right to trust him to a positive extent, when he has said, "Shall not the Judge of all the earth do right?" If I can not be positive here, I have no assurance that there is anything positive in this world.

G. M. DOOLITTLE.

Borodino, N. Y., June 18, 1889.

Now, old friend, my observations do not quite agree with yours, as given in the above. I have seen black bees a great many times start queen-cells about swarming time. After the queen-cell was well along, an egg would be found in it, and then the milky food. Perhaps I may say I have never seen very much natural swarming with the Italians; but I have a great many times found the first indication of a queen-cell (that is, the first that my eye caught hold of) was an accumulation of milky food around a small larva; and when Adair, years ago, suggested that the bees, at least sometimes, put this milky food around a certain small larva, just because they had no other place to store it, I began from that time forward watching for instances to corroborate his theory, and I have found a great many of them. I think I could take you out into our

apiary now, and find just such cells; and in 24 or 48 hours more a queen-cell would be built around it. Another thing, our weak colonies here in Medina do not swarm. Our corn does tassel out when it is about so old, as you say; but we have never had the swarming mania with us to such an extent that colonies that only half filled their hives sent out swarms. We have often read of it, I know, but it does not occur here in our locality. In regard to the peculiar state of affairs during the past few weeks, it is just as I should have expected. The bees could not get out of the hive and gather honey and pollen, therefore they did not have enough milky food to feed the larvæ, to say nothing of piling up some of it to start queen-cells. Most truly does the Judge of all the earth do right; but one of the most righteous acts of his, as it seems to me, was leaving this universe for man to improve, and supplement nature. Instead of letting the calves have all the milk, we by artificial means take the milk from the cows ourselves; and in a like manner we take the other good things he has placed within our reach. Besides, we improve the cows, and improve the strawberries, and make Nature do a thousand other wonderful things she would never have thought of doing without our help. The above are simply A. I. Root's views. He may be wrong and you may be right; but, more likely still, the truth may be somewhere between us.

MOVING BEES SHORT DISTANCES.

HOW A CALIFORNIA APIARIST MOVED 75 COLONIES $\frac{1}{4}$ OF A MILE SUCCESSFULLY.

LAST January I bought 75 stands of bees, and rented a location where they were for three years, with the privilege of moving my other apiary on the same ground; but I preferred to locate my bees further up the cañon, a quarter of a mile to the north. The first week in January I moved my apiary of 90 colonies to said cañon, a distance of 8 miles. Now, my 75 stands stood where they were when I bought them; and to move them two feet a day for a distance of a quarter of a mile, through a winding narrow road up the cañon was more than I cared to do; so I went to work and fixed every thing ready a day or so beforehand; then about sundown I shut them up in their hives and commenced to move my bees. I moved them all that night to where I wanted them. After I got through moving the bees I set to work to make the old location look as strange as possible by clearing every thing away that was movable. About 8 o'clock next morning bees were flying thick about the old location. I kept watching them, and soon found they were taking possession of an empty hive about 50 yards away. I secured the empty hive and carried it into the honey-house; but not before I had been severely stung by the bees; then they tried to get into the honey-house; but they had no show but to go back to their hives in the new location, which they did, but not before showing meanness, for they got on the war-path. They kept my wife in the house with doors closed, and I was kept in the honey-house watching them and the chickens, but it didn't last long, for the chickens gave them the right of way, and hid themselves

in the brush; then when the bees found that there was no place for them but to go back to their hives, and nobody or nothing to pick on, they went back; and before noon the moved bees were working, bringing in pollen and honey as well as they were the day before, and I haven't been able to see any difference in them since, and I don't think there was a pint of bees lost in all. Had I left a box, or something for them to cluster in, I know the result would have been different.

May 1, 1888, I moved 9 stands of bees about 20 rods. I moved them in the night time. The next morning a great many of them came back, loaded with honey and pollen. They began to get cross, and I gave them a large box to cluster in, and that made them peaceable; before night the box was well filled with bees. Fully half of the nine stands had returned. That night I carried them back, but they would not stay; and after carrying them home three or four times I got tired. The moved stands were so weakened by the loss of bees that they didn't recover to be of any use to gather honey for three weeks. Now, had I not given them that box, all would have been well in a few hours.

Bees always know the way back to the place they start out from in the morning, just as well as they know the way back to a certain tree or plants in bloom and yielding honey. But they are not going to leave their old location and stick to the new, if you give them any show, some colonies excepted.

San Bernardino, Cal., Feb. 2, 1889. R. POWELL.

I am greatly interested in the experiment you mention, for it certainly was an experiment, and one on quite a large scale. I was well aware that the bees could be made to find their hives where they had been moved for only a few rods; but I did not suppose it possible that the bees of a whole apiary could be made to go a quarter of a mile. The point you mention, where you state that they *know* where their home is, as well as they know where a tree is that yields honey, is very ingenious, and I am not sure but you are right about it. Suppose, however, your neighbor had hives of bees nearer to you than the new location a quarter of a mile distant. In such a case the bees would probably go into your neighbors' hives, or into any neighboring hives, may be into trees, or cavities in the rocks, if such happen to be near, so the plan is somewhat risky. In my experiments of years ago, in giving bees a flight in a greenhouse, I experimented quite a little in moving the hive to different parts of the room. The bees were working on a tray of meal. I moved the hive away and then watched to see their surprise when they did not find it. After flying about, wearied and perplexed, a while, they would go back again to the meal, and sometimes gather and pad a little more. Then they would start again, and go like a shot to where the hive had always stood; but when baffled and discouraged again, they would go to the meal. Finally one bee, in circling about, came near enough to the old familiar home to get sight of it. He instantly dropped at the entrance, and with his wings raised a loud call. In a little time his comrades joined him, and then what a rejoicing there was! After that, none of them had any trouble, or trouble of only short duration. The point you make

is, that, instead of giving them a box or some combs to cluster on, we should give them nothing of the kind at all. Well, in such cases I have known them to cluster on a bush, and hang until they died.

THE ORIGIN OF THE SWARMING IMPULSE.

FRIEND HASTY GIVES US SOME FURTHER SUGGESTIONS IN REGARD TO THE ABOVE.

AS to the matter on page 445, friend Root, I think you have chastised brother Miller enough for this time, and I won't get after him any more. In fact, it is hardly in order for the schoolmaster to whip the offender awhile himself, and then say to the other boy, "Billy, now you come and pound him for a spell."

Friend Miller has the idea correctly, except that he has limited it a little. I wish it to include the queen as well as the workers. Wait a moment before crying "Nonsense!" at that. The queen is indeed lighter, smaller, and laying less rapidly at the time of swarming than before. She does not like to extrude eggs and throw them away; and the check of egg-production, although it causes the ovaries to decrease in size, causes at the same time the blood to assume a peculiarly enriched character. She, as well as the workers, is "loaded up," as you express it, but, carrying the load in a different place from usual, she feels engorged and restless. Also, I wish it to include not merely the larval food in process of secretion by the workers, but also the elements in the fluids of the bee that supply material for larval food.

The experiment of returning a swarm after taking out the sealed brood, and returning unsealed in the place of it, is interesting, but conclusive in one direction only. If the swarm comes out again it can still be said, "This expedient would have prevented the swarming impulse from getting started, but is not sufficient to eradicate it after it is fully inflamed. You are able to prevent your daughter from wishing to run away with a young scamp, if you attend to the matter in time; but after she has fully resolved to do so, you may be unable." Let us keep a general lookout in all directions, to see if we can ever detect the swarming impulse getting started among bees who are fully employed, or a little overworked, at brood-rearing. Experiments in the other direction may be worth trying. Many report apiaries that give only three or five or ten per cent of swarms. Let two or three of the steadiest colonies in such be selected, and take away the frames of eggs before larval food is put in them to any extent. Give them sealed brood, or newly emerged bees enough to fully compensate the loss they sustain, and see what the result will be. If other things are favorable to swarming, I feel pretty sure they will swarm very soon. Unfortunately, it is here possible to claim that dissatisfaction and annoyance caused the swarming, and not the "loaded-up" condition of the bees.

Perhaps the theory also explains why bees so generally swarm when the first batch of queen-cells is capped. Royal jelly is supposed to be nearly identical with the white food put in the worker cells just about the time the eggs hatch. When there are few eggs hatching, the workers avoid engorgement by crowding great masses of this food

into the queen-cells. When this resource is cut off by the sealing of the cells, the crisis occurs, and out comes the swarm. There is usually a younger batch of cells in the hive; but I think that, in the building of queen cells, bees divide up into *clans*, each cell or group of cells being in charge of a separate clan, which "holds the fort" steadily, and does not let others enter.

E. E. HASTY.

Richards, Lucas Co., O., June 7, 1889.

Friend H., your concluding words just now remind me of a theory put forth by our old friend D. L. Adair, perhaps 20 or 25 years ago, in the *A. B. J.* It was this: That when the interior of the hive got into the condition you have described, so that the nurse-bees were full of milky food for young larvae, without any place to put it, then, as they could not do any better, they agree to stow it away somewhere until needed. One starts it by placing his around a worker larva, giving this worker a great deal more than he needs; then some other bee takes the hint and deposits his superfluous larval food in the same place. To make it stay in the cell, an enlargement is made, and this forms a rudimentary queen-cell, and the superabundance of food causes this worker larva to become a queen. Adair suggested that the fruit-buds on trees were formed in a similar way; and it is well known that any thing that checks the growth of the tree tends to the development of fruit-bearing buds. I do not know but Dr. Miller will call both of us "visionary fanatics" when he comes to read the above. A good many of us laughed at friend Adair, years ago, when he started the idea; but I confess that it looks much more reasonable now, after having *lived* and *learned* all these years, than it did then.

RAMBLE NO. 18.

HE DISCOURSES ON THE POSSIBILITIES OF MAKING A FIVE-CENT PACKAGE FOR HONEY.

THE Rambler is always delighted to visit an ingenious bee-keeper. There are so many new things, or new ways of performing old things, that all the faculties are kept on the alert to learn the new things. Oh, no! there is nothing dull about a *live* Yankee.

In our Ramble to the apiary of Mr. John Henderson we found a Yankee and many new ideas. This ramble would be of undue length, to mention all to be seen; but at this time, when our friends are thinking of marketing their honey, it will be well, perhaps, to confine ourselves to what Mr. H. has done in the line of five-cent honey-packages.

Long before there was any thing written about penny packages for honey, Mr. H. was experimenting. His idea was to get a package for candied honey that could be eaten from the hand cleanly like an apple, and to be sold for five cents. Honey on a stick might do for Canadians; but according to Mr. H., no true Yankee would ever be seen going around with such a daubing arrangement so long as wood and metal could be tortured into a mechanical shape to prevent it. So our friend set himself to work to make the package that would sell in every candy-store, and surfeit every boy and girl in the land with honey.

His thoughts first turned to a wooden box as the

cheapest material. The delivery of honey from the box was to be automatic. To accomplish this, instead of turning out the whole interior of the box,

FIG. 1. HENDERSON'S HONEY-TIN.

a center was left, to which the cover was secured by a screw. The cover was also provided with an orifice near the edge, and a scraper, which projected to the bottom of the box. Now fill the box up with candied honey. Screw on the cover; give it a turn in the right direction, and the honey comes boiling up through the orifice, to be eaten off by the purchaser—see Fig. 1.

Our friend was not able to make costly machinery for the manufacture of these boxes on a large scale, and he next turned his attention to a unique device which he called his "canteen honey-package." This package was suggested by the soldiers' song, "And we drank from the same canteen." Our friend's honey-canteen was about the size of an ordinary blacking-box, having a bright ribbon attached by which to carry it, and with an orifice in one edge for the exit of honey. In Fig. 2 the dotted line shows a strip of thin flexible tin, fitted inside the canteen, and attached at one end to the canteen, and at the other end to a wire which projected in the form of a crank. Turn the crank, the strip of tin is wound up, and the honey is forced out of the orifice, to be eaten.

FIG. 2. HENDERSON'S HONEY-CANTEEN.

The next package, shown in Fig. 3, Mr. H. spent much time upon, and thought he had found just the thing; and the Rambler thinks this package, in mechanical operation, can not be much improved for this special purpose.

FIG. 3. HENDERSON'S HONEY-TUBE.

Mr. H. observed some artistic members of his family at work upon an oil painting. The bright colors were placed upon the palette by being squeezed from what appears to be a tin tube. Mr. H. scratched his head and scratched out this idea: If he could get those tubes of the right size they would fill the bill for his five-cent package. After much correspondence he found that a greater proportion of these tubes were made in France, from drawn tin. The tin, by proper machinery, was drawn down very thin. A firm in New York was found that could make these tubes and a few were ordered; but instead of having the little lead screw cap, seen on the paint-tubes, the honey-tubes were left open full size, about an inch in diameter, with a heavy supporting rim around the edge. The lower end was folded like the ordinary tube. It was

then filled with candied honey, a bright label put on, and a piece of tinfoil put over the top, and it was ready for market. To partake of the sweetness within, take off the cap, squeeze the bottom slightly, and the honey is forced out in small or large mouthfuls, according as you squeeze. The Rambler was so pleased with them that he has one now for a keepsake, and as a curiosity to look at, for that is all we can do with it at present; for, being made of seemingly pure tin, the tubes alone would cost nearly five cents each in large quantities. Mr. H. being disappointed in the cost of the tin tube, then experimented with a paper tube; but it looked so poor by the side of tin that our friend gave up until he can find some better substitute, or manufacturers who can give better terms on manufacture. Mr. H. reckons that a two-ounce package should not cost over 1½ cents, or, better, one cent.

FIG. 4. THE HARMER AND RAMBLER FIVE-CENT PACKAGE, PILED UP.

For the present it seems there is nothing left in the five-cent line but the neat comb honey package of Bro. Harmer, and the Rambler's round section. The round section is easily made, but the Harmer is easier to pack and handle. We hope success for it the coming season; but the Rambler has not the patience to make them.

We have thus presented to your readers our discoveries and the obstacles in the way of the five-cent package. That some one may further develop the idea is the wish of Mr. H. and the RAMBLER.

I am very glad to see you studying on this matter of a cheap package for honey in small quantities. It seems to me, however, that none of the things you mention can possibly be afforded for a 5-cent package. The two first might possibly be made large enough to be worth 10 cts., or perhaps even 25. No. 3, it seems to me, might do very well for a dime. There has been on our table for perhaps two years a little tin box with a wooden cover. It is called "Howe's sample mailing-case," patented Sept. 9, 1879, and is intended for sending sugar and other similar articles by mail. It is simply a shallow tin box, not unlike a blacking-box, but much smaller, and deeper. At the center of the bottom of the box a hole is made. Through this is soldered a common screw, of such a length as to reach exactly as high as the sides of the box. Now, a wooden cover is held in its place by being turned on to this central screw. It may be screwed up so tight that the edges of the tin cut into the wood as it goes around, so as to make it tight enough not only for candied honey, but I should think it would be perfectly safe for liquid honey. The box is manufactured by Dailey Brothers, Detroit, Mich. I do not know the price, but they could, without doubt, be furnished for a cent apiece, in quantities, and large enough to hold not on-

ly 2 ounces, but perhaps even 4, of honey. The box is remarkably strong. The wooden cover projects a little so as to protect the edges of the tin, in such a way that even the worst treatment it may receive in the mailbags could scarcely do it any injury. I have long thought that it was perhaps the cheapest and most substantial package that we could get hold of. We will at once make investigations, and see how low they can be furnished.

QUEEN-CELLS ABOVE PERFORATED HONEY-BOARDS.

ALSO SOMETHING IN REGARD TO FRIEND DOOLITTLE'S NEW BOOK.

ANY one would suppose, Mr. Editor, by your foot-notes at the end of J. D. Fooshe's article, page 490, that you must have read my new book on queen-rearing rather carelessly, for in it I tell that queen cells will be completed when placed over a populous colony at any time of year when the bees of any colony are sufficient to enter such upper story, as to their numbers, where there is a queen-excluder between the upper and lower stories. You seem to think that the swarming fever has something to do with the matter; but such is not the case, as I have proven for years, and especially so during the past three or four weeks of scarcity of honey, during which bees have been on the verge of starvation, yet in no case where I have put prepared cells above a queen-excluding honey-board have the bees failed to carry out and complete the cells, perfecting them to the fullest extent, so that queens reared in such cells have come up to the highest type of perfection, even though the colony below were living only from "hand to mouth." The bees in the upper stories seem to be placed in the same condition, or at least feel that they are, as when they are about to supersede their queen on account of old age, in which case all are aware that bees will rear good queens, no matter what time of year it is, or whether honey is coming in or not. In all of my six years' experience with the plan given in my book I have never failed to have queen-cells completed when placed in an upper story over a queen-excluding honey-board (which plan is similar to that given by Mr. Fooshe), except late in the fall, when bees had gone into that quietude which they go into after the honey season is past. If we wish cells then, we must feed the bees so as to arouse them to activity, when they will complete queen-cells, so that as good queens will hatch from them as any which can be produced during the summer months, or in the height of the swarming season. I am not guessing at any of this, but speak it after a practical experience along this line for the past six years.

The plan as used by Mr. Fooshe, of getting the queen-cells under way before putting them in the upper story, is practically the Alley plan, as given in his book, which you in your head-lines call "an improvement on Doolittle's plan." That just as good queens can be reared in this way as by the plan of making cells of wax, which I outlined, I have no doubt; but the objections to it are, 1. That one or more colonies must be kept queenless to start these cells, which the colony having an upper story on are to bring to completion. A queenless

colony, without brood, as he describes, is of no value in the apiary, as a honey-producer; while in the way I work, no colony is kept queenless a moment on account of queen-rearing, but all are at work in sections or for extracted honey, just the same as if I were not rearing any queens at all. 2. Mr. Fooshe has to cut his nice worker combs up into strips, on which the bees build the cells. Where one makes a business of rearing queens this is quite an item; for after we have our combs all perfect in our hives it is a pity to spoil them by cutting out long strips for queen-rearing. By making the wax cups, no combs need ever be cut, where the vision of the operator is good enough to see to the bottom of the cells to take the larva out in transferring. The third objection is the most serious to me of the whole; and that is, that by his plan the cells must be handled very carefully or else they are easily mashed; and in any event a piece of the strip of comb must accompany each cell when it is detached or separated from the bar of wood to which it was fastened, which hinders it (the cell) from being used successfully in the queen-cell protectors.

Again, unless he kills a part of the eggs or larvæ with a match, as does Alley, he will have many cells built together, so that a part must be destroyed in separating them. By using the wax cups, the cells, when completed, can be picked off the stick where they were built, about as you would pick peas from a pod, while the base of them is sufficiently stout so that the queen-cells can be pressed into the combs of queenless colonies so they will be a fixture wherever you wish them, thus saving the cutting of combs in placing the cells in the hives as we used to do, and as is pictured out in many of our books.

In nearly all of the comments on my book, I see many suppose that the book was written for queen-breeders, who follow the rearing of queens as a business; but this is a mistake. The book was written for the sole purpose of benefiting *all* in the bee-business, from the man who counts his colonies by the thousand down to the amateur who has but two or three. All parties want queens for any case of emergency which may come up, or for the purpose of superseding those which are past their usefulness, or are not of the "blood" which they wish, or to give to the parent colony after the old queen has gone out with the swarm, so that second swarming may be prevented. How handy it is, then, to rear such queens in an upper story, get them fertilized in the same by slipping in a perforated zinc partition so as to inclose a comb or two on each end of the hive, from which the queen may issue to meet the drones, and, after returning, be kept laying here till she is wanted for use, thereby aiding the queen below with brood all the time she is being held before she is wanted for use! The possibilities which are before us along the line which this perforated metal may bring us, have only begun to dawn upon us. Queens can be reared and fertilized by the thousands in any apiary, and yet no colony be kept queenless for a single moment, nor any nuclei made, but all work in the apiary be going on just the same as if no queens were being reared. The advent of the perforated metal is likely to mark an epoch in our history, fully equal to that of the honey-extractor, movable-comb hive, or any thing of the kind.

Borodino, N. Y.

G. M. DOOLITTLE.

Friend D., I shall have to own up, and

beg pardon. It is true, I have not, or had not until this morning, June 26, looked at your book more than to turn over the pages a little and look at the pictures. The reason is, that I am already overworked on reading things that I *must* read; but I now find that it would have been far better had I neglected some other things, and given your book the careful attention it deserves.

When Ernest made his review notice, he read the first six chapters; but I now see that he did not get to the most important matter in the book at all. I want to say to our readers, that friend Doolittle's book is as interesting, at least to me, as any thing I have ever read in regard to bees, hardly excepting father Langstroth's book when I first got hold of it. One reason is, that it is right along on a line where I worked for months, several years ago. I experimented by placing wire cloth between the upper and lower stories. Perforated zinc was not then known—at least I had not at my command any thing to permit the worker-bees to go above and hold back the drones and queen; therefore my experiments amounted to but little more than having queens raised in nuclei above, in strong colonies. These nuclei were either shut off entirely by wire cloth, or else these drones and queen had free access to the upper story. By having upper entrances, I succeeded in getting queen-cells built and queens fertilized to some extent; but it did not pay, and I was continually annoyed by being obliged to disturb the nucleus every time I wished to get into the lower story of the parent colony. This latter point, if I understand, is still an objection to Doolittle's method. I do not know whether friend Fooshe had read friend Doolittle's book when he wrote or not; but it is true, that the whole plan is given in very full details in chapter 7 of Doolittle's book. In chapter 13 we are told how to get queens fertilized in the same hive where there is a laying queen. These two chapters are certainly worth the price of the book to any bee-keeper. In fact, it seems to me that every man, woman, or child at all interested in bees, ought to read friend Doolittle's book. The accounts of his discoveries read like a book of fiction. In fact, it sounds to me in some parts like the Arabian Nights; and yet it is absolutely true, every word of it. You can verify it yourself with your own bees. I know it, because I have experimented all along in the same line. Those who are unfamiliar with this intricate, complicated, and wonderful matter of securing queens from an egg that would, in the usual course of events, have produced a worker-bee, will become familiar with the matter by reading friend Doolittle's story. The whole of it seems to have been written in friend Doolittle's happiest vein. I should judge that he had given the book great care and pains; and I believe that is the way he usually does every thing. One reason why I did not give the book more attention, I supposed it was a good deal a summing-up of what had been already given in the journals. But a great part of the book contains information that has never been in print before, that I know

of. Of course, it will be more interesting to those who raise queens largely than to those whose business is mostly honey-raising, and who, for the most part, let the queens raise themselves. It seems to me, however, that we can all of us smile a little when we read the book, to think how often its author talks about "nature" and nature's methods. Why, the plan he gives is the most unnatural, and there is more tinkering with nature, than in any thing that has ever before been written, and yet his methods are in perfect harmony with the natural instincts of the bees.

UNFINISHED SECTIONS.

SOME GOOD SUGGESTIONS FROM JOSHUA BULL.

IN response to your repeated invitation for reports concerning the use of unfinished sections, I wish to say that, for several years past, I have used all I could get of them. Not two or three only, just to entice the bees into the supers, but when I have plenty of them I fill some supers full of them; and the bees will fill with honey and cap them several days sooner than where full sheets of foundation are used in the sections, other things being equal, even though they may commence just as readily upon the foundation as in the other. Where foundation is used it requires a large cluster of bees in the super all the time, to carry on comb-building successfully and rapidly, when, if the combs are already built, the most of those bees can go to the field to gather nectar during the day, and evaporate it at night, as friend Doolittle has so clearly shown, and so far as quality or appearances are concerned, I should feel quite safe in offering to give to any man, be he novice or expert, all of such sections that he could detect, judging the honey alone, when they were mixed up with others which had only foundation in them when put into supers. Some of the wood might be a little more soiled, or stained with propolis, or something of that sort, by which an expert might possibly detect them; but not from the appearance of the honey or comb. I never put a section containing old honey, partially capped, into a super to be finished up, without first removing all cappings; and I never put in one containing any dark honey in time of white-honey harvest. And even empty combs that were built in the fall, when the weather was cool, are often thicker and heavier, and sometimes much darker-colored than combs built in June or July. Any such dark or heavy combs should not be used for the storage of white honey, for reasons which are too obvious to need explanation.

FLAT-BOTTOMED FOUNDATION.

Experiments last summer with different kinds of foundation, considered in connection with my experience in eating comb honey during the past year, has inclined me more than ever in favor of the use of flat-bottomed foundation in sections, because, in the first place, it is made thinner than other kinds; and then the bees, in shaping the septum, work it down yet more until the septum is not much thicker than the side walls of the cells; and when eating honey stored upon such foundation there is not such an accumulation of wax in the mouth as is usually the case when natural-base foundation is used. And in spite of all that can be

said to dispel the objections to this accumulation of wax in the mouth when eating comb honey, the fact still remains that most people like honey best when the wax is least conspicuous—at least I do.

OPEN-SIDED SECTIONS.

Before closing I want to say a few words in favor of open-sided sections. I tried a few hundred of them last year, and was so well pleased with the result that I have bought 2000 of them for this year's use; and if my present impressions prove to be well grounded, I think that I shall eventually use them exclusively. I find that, if the openings in the side of the sections are made $\frac{3}{8}$ of an inch deep, these open-sided sections can then be used in the common wide frames with ordinary separators without perforations. There must be a bee-space of about $\frac{1}{8}$ inch between the comb in the section and the separator; and if there are no perforations in the separator where the sections meet, it just gives an even passageway from one end of the frame to the other, and the bees will have no inclination to build comb over the edge of the sections to unite it with the comb in adjoining sections. I prefer tin separators, because wooden ones are liable to warp or bulge, and close some of the openings and deform the comb in some of the sections. To prevent the propolizing of the section to the end-pieces of the wide frames, I make the latter with a little block tacked into each corner of the frame, in such a manner as to hold the section $\frac{1}{4}$ inch from the end-piece, thus forming a bee-passage between the section and end of wide frame. This obviates all difficulty in that direction. I aim to have the sections fit so closely that the bees can not get any propolis between them, nor between the sections and the top or bottom bars of frames; and, furthermore, when sections are tightly pressed together it keeps them all true and square; and when they are filled with honey they brace one another up, bridge like, which helps to keep them from sagging away from the top-bar.

I have also devised a sort of clamp super, in which to use open-sided sections without wide frames; and from the little experience I had with it last year, I feel quite sanguine that it is going to prove to be a very satisfactory arrangement.

Seymour, Wis., Mar. 28, 1889. JOSHUA BULL.

We are exceedingly obliged to you for your very valuable reports on all three of the above items. Even though our experience may not be like yours, we are glad to have such facts furnished us from actual experience. In regard to flat-bottom foundation, although we advertise and sell both kinds, we sell ten pounds of the regular-base foundation to one of the flat bottom. There is this to be noticed, however, that there seems to be a slight increase in the amount sold, of the flat bottom. Whether this is due to the excellent season, or whether the flat-bottom foundation is growing somewhat in favor, we can not say. In regard to the open-side section, it seems to be going somewhat out of public favor. We constructed special machinery for making, and we expected a heavy run, but were very much surprised to find that there is very little demand for them. This may be due to general conservatism, or to the fact that a few have been tried, and were found wanting. The few sold have been for the most part to foreign countries.

MANUM IN THE APIARY WITH HIS MEN.

PRACTICAL SUGGESTIONS IN REGARD TO WORKING FOR COMB HONEY.

JULY 10. "Good-morning, Scott. Here I am again."

"Yes, sir, I see; and I am very glad to see you. I have been looking for you these two or three days."

SMOKING BEES WHEN THEY DON'T NEED IT.

"Well, I have been very busy of late in my home apiary of 60 colonies. I also have now over 100 nuclei to look after, and it is no small job to look after them and keep them busy—or, in other words, keep them supplied with queens or queen-cells, as the case may be. I have to be very careful, and not allow a young queen to get to laying too much before shipping her, or she is not safe to ship in that condition. I am having so many orders for queens just now that it takes some time to cage and mail them; and, besides, I have to look after those two new hands pretty close. I sometimes think I will never hire a boy who has never handled bees before. It makes it too hard for me during the honey season; but I shall try to worry through it this year. We will now go over the yard, to see how well the sections are being filled. Here is a clamp with every section capped over. You must watch the sections now. Although you have tiered up all around, they will finish up the top ones very quick when there are only two tiers. Where you have three or four tiers they are liable to finish two or three tiers at the same time, hence they will be longer about it. We will remove this upper tier and raise the lower one, and place empty ones under it.

GETTING THE BEES OUT OF BOXES, ETC.

Now set the two finished clamps down on the ground in front of the hive, resting one end on the alighting-board; set them up edgewise—there—so. That is another advantage these small clamps have over large ones, as there is no danger of their tipping over. No, no! don't smoke them, as that will cause the bees to bite holes in the cappings, and spoil the looks of the honey. Just let them sit there until the bees work out of them of their own accord. There is no danger of robbing while the bees are getting honey as fast as they are now. I left out nearly a ton in this way once over night; having taken it off after supper, the bees did not all get out before dark, so I left it to carry in, in the morning."

"I should hardly have thought you would dare to leave it out over night, for fear of robbers," says Scott.

"Oh! bees don't rob during a flow of honey, especially at night; and as for the boys—to whom I suppose you refer as the 'robbers'—I have no fears. I have kept bees for 19 years in our village, and I have never, to my knowledge, lost a single pound of honey by night robbers. The boys understand that it is not necessary to steal honey in this section of Vermont. I have instructed all of my men, as I did you early in the season, to offer every person who visits the yards all the honey he wants to eat; and if he objects to eating honey clear, offer him a section to take home. In this way people will not only refrain from disturbing the bees, but they will usually speak well of the honey-bee, whether they do of the bee-keeper or not."

"How is your scale hive doing?"

"Well, 18 lbs. is the best day yet—that was yesterday. I hardly think I shall get 33½ lbs. this year, in one day."

"I don't know about that. You have a good working colony in that hive; and if we get just the right kind of weather when basswood gets at its height they will come pretty near it. It wants a hot sultry day, when the atmosphere is full of moisture. Should we get such a day just at the right time, I think you will beat the old record. It is not every year that we have just the right kind of weather at just the proper time to secure such a record. But I am in hopes one of these days—or years—to be able to report 50 lbs. from one colony in one day."

ONE REASON WHY SOME COLONIES DO NOT WORK IN BOXES.

"Scott, what is the matter with 26? I have just been through that row, and I notice they are not doing much in the boxes."

"Well, sir, I don't know what the matter is. I had noticed they were not doing well, yet they seem to be working lively."

"Have you looked them over lately, to discover the trouble?"

"No, sir; but I intended to to-day."

"Well, I will look in and see if I can tell the cause. Ah! I see; they are storing their honey in the brood-combs. They have but little brood, and that is not very compact in the comb. I think we have an old queen here. There! you see, in this comb there are but few eggs, and they are scattered here and there all over the comb. That indicates a played-out queen, and here are queen-cells. Where is the record?"

"I don't know. I must have lost it. Here is last year's record."

"All right; that reads, 'Swarmed, and queen returned.' She was then two years old, hence she must be three years old now, and therefore she is exhausted. There is no use trying to winter a two-year-old queen. They are too liable to fail either in early spring or during the honey-flow. With the amount of work I require of them, two seasons' work is all I can expect of any queen, to make it profitable. We will hunt her up. There she is! catch her and pinch off her head. You see she is very clumsy and small, compared with a good young queen. You may now uncap all the honey they have in these brood-combs, and just at night introduce a young laying queen; and my opinion is, that you will soon see this honey change places, and in its place you will in due time find brood. Now, as you take off honey you may carry it into the first room of the honey-house; and, at your leisure, scrape off any brace-combs or propolis there may be on the bottom or tops of the clamps, and then store it in the plastered room to ripen. I think the next time I come you will have a load for me, so I shall probably come with two horses and take home a ton or more. You will then see how I manage to haul my honey without getting my horses stung."

July 15.—"Hello, Edward! Your bees, I see, are busy this morning. I came by the Hardscrabble road this time; and as I got directly between the apiary and the Hardscrabble ridge, where there are so many basswoods, I surely thought at first there was a swarm passing overhead, as they made such a roaring. I stopped my horse and listened; and I assure you it was sweet music to me. I could also

see them plainly as they made a curve to get around the Barnum knoll and a clump of trees; it seemed as though they were running races, and each bee was trying to get there first. I noticed that the homeward-bound bees flew much lower than outward-bound ones, owing, I suppose, to their being heavily loaded. We talk about a 'bee-line,' but these did not go straight, as they made quite a curve around the knoll instead of going over it. I have come to assist you to take off what finished clamps there may be in this yard. Yesterday I was with Henry, and I found he had a good many all finished and ready to come off. He had been so busy that the boxes had been neglected; however, the honey was not soiled a particle. Here are four clamps, well capped, on this hive, and the other two are well advanced; and if the weather holds warm a few days longer they will finish them up. I think we will not put any more on this hive, unless you have a clamp of nearly finished sections."

"Yes, sir; I have two or three such clamps."

"Very well; then in two or three days, if it holds warm, you may put on one of them. As we can not expect basswood to hold out more than five or six days longer at best, we must reduce the storage room in order not to be left with a lot of unfinished sections. Of course, we shall have some; but let us try to have as few as possible. You may also now fill up the brood-chambers with comb or foundation; that is, wherever you find a colony that has only ten or eleven combs, give the bees the full complement of twelve combs. You know that all the new swarms that came out before June 20 were hived singly and on only ten combs, with a division-board on each side to take the place of the missing combs. Now, then, just draw out these division-boards, and let a comb slide down in their place. This can be done without disturbing the other combs or the bees. These two combs being the two outside ones, I am in hopes the bees will fill them with honey before the queen finds them. A few years ago I did not do this, as then sugar was cheaper to winter on than honey; but now—oh, dear! how things have changed! and it is cheaper to winter on honey than on sugar. I want these combs put in now, because we do not have a late flow of honey here as they do in many places, especially west; and sometimes I think it is all the better for me that I do not; because if I did I should expect my bees to have the dreaded bee-diarrhea, which I think is caused by a poor quality of honey gathered late in the season, as well as an excess of pollen. Now, another thing: I want you to hunt up all the two and three year old queens in the yard. You will readily find where they are, by the records. Kill them, as I do not intend to winter a queen that is over one year old. Now is the time to do this work, while the bees are getting honey. They are not so cross now as they will be at the close of the honey-flow, nor will they rob as they would then. You may then introduce young queens from your nuclei; and if you should be short of queens I will bring you some from home. This is the time to commence preparing the bees for winter, and requeening is the first work in preparing for winter—with me. You are not obliged to do this all to-day or to-morrow, but do it as you have time, without interfering with your other work.

A. E. MANUM.

Bristol, Vt.

I am very glad indeed to see you caution the boys about smoking the bees when there is no need of smoking them. A great many beginners get into such a stereotyped way of puffing smoke into the colonies that they do it even when the bees are on their very best behavior. It reminds me of some mothers who seem to take it for granted that babies must be spanked about so often on general principles. Now, when I see a baby spanked, that is doing its very best to be good, it always puts me in a fighting mood, and I feel the same way when bees are smoked that are just as peaceable and well behaved as any thing can possibly be. I have seen bees go for the cappings right off as soon as they were smoked, when they would not meddle with them at all if the smoke were kept away.—Your hint in regard to keeping an eye on the age of the queen illustrates how exceedingly important it is that the bee-keeper be constantly on the watch, and that he know what is going on, even inside of every hive, all through the honey-flow.—I am glad the boys in your neighborhood do not steal. Friend M., is it not because you are a Christian, and are following the precepts of the Master?—I have often stopped and listened to the "sweet music" you tell us about. You say, in conclusion, that you do not intend to winter any queen that is over one year old. Now, if I understand you correctly, I do not believe we should quite agree on that. A queen that had given us a tremendous crop of honey during one season should certainly have a chance to do the same thing the next season—that is, if she seemed all right, and nearly or quite up to her former vigor. Perhaps, however, you mean that you would let them go through the second season.

HIVES.

FRIEND HEDDON OFFERS SOME SUGGESTIONS.

FRRIEND ROOT:—I desire to level my gun and fire away directly at you; and if there is any thing of sufficient value in this article to publish, do so; if not, read it over and we will have it between us. I have been much interested in your Dovetailed hive with my break-joint bee-space honey-board, etc. I eagerly open each number of GLEANINGS to see what you say about it. I have smiled, and I know many others have smiled, when reading your editorials on how popular the hive is. Now, let me go back a little. All these years, when you have been selling the Simplicity hive, and selling, perhaps, more than ten to every one I have sold of the Heddon-Langstroth hive (as I have named my modification of father Langstroth's great invention), I knew very well that the L. hive, as I used it, was very much better than your Simplicity, and that some time the truth would be known, and it would become very popular; but, of course, I can not reap the reward of my early discovery. You have a monopoly on advertising. Now, I am finding no fault. You have just what you have earned, the same as others do, and the same as the rest of us would have, had we worked it up; I am just trying to tell you how it is.

Now, your Dovetailed hive is to me simply my Heddon-Langstroth of the loose-bottom variety as I have been making and selling; but with the dovetailed corners added—not a new invention, but a new application, transferred from a soap or candle box, to a bee-hive. It is a *good* thing. Perhaps you are asking how I knew and now know that my modification of the L. hive was so much better than yours, the Simplicity. I will tell you. So very many bee-keepers like Professor Cook, Hutchinson, R. L. Taylor, F. P. Styles, and so on up to forty of them, who are bright, clear men, and practical and successful honey-producers, dropped the Simplicity and adopted my modification, that my experience and opinions were verified by these friends. But, now, friend Root, is not there something else better still? I do not expect you to see all at once the many advantages possessed by my new patented hive; but I do believe the time will come when you will fully realize and appreciate them all. In this article, let us leave out of the question the best feature of all—the divisible, alternating brood-chamber, and give our attention to the style of frame in combination with its adjustment to the brood-case. The standard eight-frame L. hive is ten inches deep. Now, if you make the same brood-case eight inches deep, and put in my close-fitting reversible frame, with end-bars loosely fitting the case, nine inches deep, it would give you the same capacity. Here is certainly an advantage; for shallowness in the brood-chamber is an immense advantage in every respect. It is easier to handle; it is better adapted to surplus storage; bees will breed up better and faster, not only in the spring, but at all other times of the year; and, lastly, they will winter better than in any deep hive. If I could get the capacity desired, as cheaply, and still keep the standard length and width, I would not have my combs over four inches deep. The fact is, the shallower the better. But, to return:

Suppose you make your dovetailed brood-case nine inches deep; nail a tin strip on the bottom of each end-piece, projecting inward an eighth of an inch; make the frames close-fitting, just the same as I make them in the new hive; and these shallow half-brood-chamber cases, put the screws through the sides, and clamp them up together snugly, so that the whole thing can be instantly inverted, as well as each frame being invertible at will, and now don't you see that you have a very much better brood-chamber than you possibly could have with the swinging loose-fitting frames? But these latter frames had some advantages; advantages which, in the minds of many bee-keepers, overcame the superiority of the close-fitting frames, but now with the new arrangement of adjusting the frames to the case, by which the glue is avoided and the frames can be handled much safer and quicker, and since wire and comb foundation have given us such straight combs, to me there is no comparison between the many advantages peculiar to this style of frame. The close-fitting frame, adjusted as in my patented hive, is, I am confident, going to win the preference with all practical honey-producers. Think of it; and after you have done so, and experimented, feeling sure as I do that you will find it as I have said above, then make the case shallow, using two of them for the complete brood-chamber of full size, and one of them when that valuable system of contraction is practiced, and you will ap-

preciate my new hive then as you now appreciate my break-joint bee-space honey-board.

Dowagiac, Mich., June 10, 1889. JAMES HEDDON.

You say, friend Heddon, that "I desire to level my gun and fire away directly at you." As there are two Roots here at the Home of the Honey-Bees, it is a little difficult to tell at which your gun is leveled. As, however, you place emphasis upon the personal pronoun *you*, the inference is that your weapon is directed at A. I. Root; but it so happens that A. I. R. is not the "game." He has neither said any thing in favor of nor against the Dovetailed hive. Neither has he "gone back on" the Simplicity. Perhaps I should say in this connection, the *I* means Ernest R., as your humble servant has written the editorials and other matter referring to the Dovetailed in particular. A. I. Root rather inclines toward the Simplicity, although he is not opposed to the Dovetailed. I make this statement so that the lack of consistency may not be ascribed to him. While in pattern the Dovetailed hive is similar, as you say, to the Heddon-Langstroth, yet in quite a number of respects it is different. The bottom-board is movable and has a raised rim, as you have already intimated. The body is dovetailed, and dispenses with the cleats at the top, and uses, instead, hand-holes. If you will turn to page 172 of that excellent work, Dabant's Revised Langstroth, you will see that our Dovetailed hive is more of a copy of the Blanton hive than of the old-style Heddon. After we had settled upon the construction of the Dovetailed hive, I accidentally ran across the engraving of the Blanton hive in the Langstroth Revised, and was surprised to note that we had both hit upon the same thing essentially. I do not quite see why you should want to call the new Dovetailed hive a Heddon-Langstroth. It is more a Blanton-Langstroth. Blanton's hive has essentially the same bottom-board and cover. The two bodies are exactly the same, without the dovetails and hand-holes.

In regard to closed-end frames, you will see by my article in last issue, under the head of Recent Developments, that I admire some of their features. It is possible that I may one day become a convert to them; but from what I now know of them, I think I should prefer the Hetherington reversible metal-casting frame; or if this should not prove to be a success, the ordinary hanging frame. I have tried your close-fitting upright repeatedly. While your thumb-screw makes its manipulation more simple, yet you do not obviate the killing of bees between the bottom of the upright and the tin support below. Of course, you can avoid it to some extent by letting it down gently, and, by a slight pressure, causing the bees to slowly work their way out; but to handle every frame thus, I tell you, takes time; and after you have gone through the sixteen, you have examined only one brood-nest. You will say, handle *hives*, examine the brood-section at once *in toto*. I can't do it as yet satisfactorily. From my present experience I should much prefer full-depth closed-end frames (if I were to choose close uprights at all), with thumb-screw arrange-

ment, to the same half-depth, with the thumb-screw.

In addition to what Ernest has said, I may remark that I have rather objected to giving the Dovetailed hive so much prominence; and I think yet that a good many will go back to the Simplicity who are trying the Dovetailed, although I concede the advantages of the latter. I hope, however, that it will always be used as an eight-frame hive, and the Simplicity always as a ten-frame. In regard to copying, in one sense the Dovetailed hive infringes on a dozen other hives. In another sense, it does not infringe on any, for the features of these dozen other hives are pretty nearly if not quite all old ideas. With the experimenters we have among the bee-fraternity, it has got to be a very hard matter, in fact, for any one to say truthfully exactly what is his invention and what is not. Scarcely a thing comes up but what has been experimented on before; most of the time the same thing has been spoken of and illustrated in some way by the various bee-journals. The Dovetailed hive can scarcely be called an *invention* in any sense, for it is only a combination of features already well known, and that have been a long time in practical use. Perhaps its greatest merit is that it is cheap, strong, and compact. It is easy to crate for shipment, and easy to put together when at its destination.

BITTER HONEY.

IS THE BITTER-WEED A BENEFIT TO BEE-KEEPERS
IN THE REGIONS WHERE IT GROWS?

WE are interested in this section about bitter honey. Pretty much all over this belt of the South, I think, we have a weed that has taken possession of all uncultivated and uncultivated land, growing as thick as oats or wheat, and lasting from May till frost. This weed, when eaten by cows, gives milk so bitter a taste that it can not be used. Some years honey is made from this weed, which, though of good consistency, and of light color, is as bitter as a syrup tinctured with quinine. There is no question as to bees working on it. They often get a large winter supply from it, and "swarm" from this fall prosperity. Two years ago I had general swarming in the fall, and the whole apiary went into winter quarters solid, late swarms and all, with fully 50 lbs. to the hive, the most of it from this weed. It appears above ground about May 1st to 15th, and blooms about August 1st. It thrives during droughts, and blooms continuously till frost. Some years the bees do not work on it much, and I have thought they used it only when nothing better was at hand. Friend Jenkins, of Wetumpka, thinks it a blessing, as it furnishes winter stores, and, coming late, does not interfere with other honey. I differ with him in this, as we sometimes have good yields from goldenrod. Prof. Cook thinks no bitter honey comes from flowers but that from bark lice. We, hereabouts, feel sure that this weed produces bitter honey; but as it was comb honey I handled two years ago, having then no extractor, I think it may be possible the pollen on the bees' feet, tramping over the comb, embittered it, and possibly the hon-

ey itself was sweet. Not being familiar with botany, I can give no description. I can send a specimen, however, when it blooms. The flower is yellow.

Bees are killing drones. Our season has been short, on account of drought. No rain in May.

Pontotoc, Miss., May 28, 1889.

C. P. COFFIN.

Quite a number of samples of bitter honey have been sent us—mostly extracted, but we have never had any opportunity of determining with very much certainty just where it came from. I have never before thought that the *pollen* might give the surplus that is *capped* a bitter taste. If such is the case, however, I think that even extracted honey might have a trace of it. I should hardly consider the bitter-weed a benefit, especially as it is always liable to injure the price of the honey.

JAMAICA LETTER.

THE GLOW-WORMS AND FIRE-FLIES OF THE TROPICS.

FRIEND ROOT:—Your letter, saying your books showed \$8.25 to my credit, was received, and is in striking contrast with the methods of some men with whom I have had to do recently. I should think some persons who are accustomed to decry Christianity could see its genuineness from a financial standpoint, if from no other. Many thanks for GLEANINGS. It has been a real source of pleasure to us as well as a storehouse of useful knowledge. Some departments are more interesting than others, yet we read all, even the advertisements. Professor Cook's department is especially interesting to us; and if he were here he would find much to interest him. While I am writing this a green lizard, *Ameiva dorsalis*, about four and a half inches long, is playing about. They are numerous in all parts of the island, and can be seen darting from your path, running on the fence, basking in the sunshine on the trunks of trees, peering from beneath leaves and out of crevices. Indoors they are seen running on the walls, darting across the floor, catching flies on your chair or desk, and playing their antics in the jalousies. When playing they crouch like a tiger, creep on their belly, and raise and lower themselves gradually three or four times, and protrude from the under side of the throat a fan-shaped disk of a crimson or orange color. When frightened or angered they turn a dark buff color. I have noticed the same lizard shed his skin about seven days later—an effect of the anger or nervous shock, I presume. Like the serpent, they suffer from their reputation. This is especially true from ladies who visit the island; and the unreasonableness of prejudice was forcibly illustrated by our neighbor, an English lady, recently. On the approach of one of these harmless, graceful little creatures, she would exclaim, "Oh, the nasty little thing! it has such a long tail!" By and by, one which had the misfortune to lose its caudal appendage came up as if to claim her approbation, when she shrieked, "Oh, the nasty little thing! it has such a short tail!" Another one, whose tail had been cut off, but had grown to half its original length, was frightened until it turned brown by the exclamation, "Oh, the nasty little thing! it has such a queer tail!"

Little Arthur is playing at my side with a glow-fly, which he calls Blinkey. I suppose it is so named because its light is intermittent. He says it has two lanterns on its back—two oval luminous spots on the dorsal surface of the thorax. These spots, or tubercles, are visible in daylight. When the insect is quiet, the spots are opaque; but when disturbed they ignite and increase in intensity until the light becomes dazzling. The color of the light is yellow-green. When its body is distended in flight it emits a light of a ruddy color from a membrane on the ventral side of the abdomen, which is thrown like the light from a bullseye lantern, and covers a space three or four feet in diameter. On a dark night the light from one of these flies makes every object in the room visible, and I have frequently determined the time of night, and got a drink for the children by it. The natives who can not afford the luxury of a lamp or candle, frequently light their houses by means of three or four of these glow-flies in a bottle. A few nights ago I met several children in the road, and all had a glow-fly, which they were using as a lantern. There are various species of fire-flies; but most conspicuous among them is *Photuris versicolor*, or "Winkey-walie," as the natives call it. It is frequently seen resting on the wall, when it will gradually increase the intensity of its light until it glows like a torch; then it gradually dies away until it becomes extinct. It will remain for a time, then gradually increase to its former brightness, and die away again. There is a clump of bamboo before the mission house at Providence that nods in the breeze like great ostrich plumes; and during the dark nights in May, myriads of these fireflies take up their abode in it; and the light from their bodies, reflected and refracted from the drop of dew on each leaf makes it a veritable burning bush. J. W. JENKINS.

Providence, Jamaica, April 17, 1889.

We are very much obliged indeed for the wonderful accounts of these insect-friends. No doubt Prof. Cook would be greatly delighted to see these things you mention; and I confess that I never before had the remotest idea that there was an insect anywhere in the world that would throw a circle of light ahead like a dark-lantern. It really seems as if they might be utilized, and bred for the special purpose of imparting light. Are they not cheaper than lights and lanterns? Who knows to what extent this wonderful peculiarity might not be increased by a little encouragement in the way of breeding and selection?

BEE-KEEPING IN CUBA.

FRIEND POPPLETON GIVES US SOME VALUABLE AND INTERESTING FIGURES.

ACCORDING to the promise I made to you nearly a year ago, I will now try to tell the readers of GLEANINGS something about bee-keeping in Cuba; but keep in mind the fact that we have been here a little over one year only, and no single season's experience can be full and complete enough to enable one to judge accurately as to resources, methods, etc.

So far as I can learn, the first movable-comb apiary in Cuba was established five years ago last October on the estate of the brothers Casanova, about 18 miles east of Havana, by A. J. King and A. W.

Osborn, the latter remaining in charge for two years, when he came here, ten miles southwest of Havana, and established this one. Mr. King also established another one a little over a year ago, some 200 miles east of here; but this was not run for honey last winter. So far as I know, these are the only movable-comb apiaries in Cuba; but others are contemplated. The Casanova apiary is fitted with hives and appliances for some 600 colonies, and this one for 500. Mr. P. Casanova has kindly furnished me with such records of his apiary as he has; but I find it impossible to obtain complete information of the workings of that apiary. Nov. 11, 1883, Mr. Osborn reports 92 colonies alive of the 100 shipped from New York. Feb. 19, 1885, he reports 113 colonies on Dec. 1, previously, and a yield of 40,125 lbs. of honey. May 7, he reports having increased during the previous year from 34 to 555 colonies, the 113 of those having survived the summer. I can get no report of the following year, but the report for the honey season of 1886-'87 is, number of one-story colonies, 41; of two-story colonies, 126; of three stories, 113. Total, 280. Honey obtained, 50,000 lbs. Season of 1887-'88, no record of colonies, but obtained 32,500 lbs. of honey. Last fall they had 62 colonies in single stories, and 322 in two and three story hives. Total, 384. Honey obtained, 20,000 lbs.

The following report of the results obtained at this apiary is as nearly correct as I can get them. Apiary started early in 1886, by the purchase of some 40 colonies in Cuban box hives, which were transferred and increased during the year to about 130 colonies, 80 of which were in condition to store honey during the extracting season, which that year closed Feb. 1, not because honey had entirely ceased flowing, but because a large increase of colonies was desired. Crop secured, 30,000 lbs. During the spring and summer of 1887 the apiary was increased to 500 colonies; but many of these died before and during the honey season, so that when I took charge of the apiary, Feb. 15, 1888, I found 411 colonies. The total yield that season was a little over 45,000 lbs.; but some more than 3000 lbs. was fed back during the following summer, leaving the net yield 42,000 lbs. We increased the apiary during last summer to only 436 colonies; but the hurricane which made so disastrous a visitation to Cuba last September blew down nearly half of our beehives, killing in their fall some 30 colonies, so we commenced the season with 400 colonies, about 325 of them strong enough to store honey in upper stories. We have taken out 50,000 lbs. of honey; but out of that will have to come the amount required for feeding back during the coming summer—an unknown quantity. Since March 1, I have increased the apiary to its full capacity of 498 colonies. So much for the actual statistics of what has been done.

Bee-keeping in Cuba is very different from bee-keeping in the States, on account of the honey-flow coming in winter instead of in the summer. I will try to give some idea of the honey-flow during each month of the year, commencing with June. These figures, or estimates, relate to a 400-colony apiary, which would, of course, be changed for a larger or smaller one. June showed an average loss of about 2 lbs. of honey per colony, this being the first month of the year when the bees gathered less than they used. The loss in July, also in August, was about the same as for June, with a still greater average loss during the first half of September. We

were obliged to feed two-thirds of the colonies during all this time, the other third gathering enough for their own use, and some 20 of the best ones giving not to exceed 5 lbs. each of surplus honey to other weak ones. About the middle of September, honey commenced to come in slowly, increasing in quantity during all of October, and until the middle of November, when it slackened off some until the 1st of December. I estimated the average increase of stores during October at 5 lbs. per colony, and during November at 15 lbs. We started the extractor Nov. 1, taking out nearly 6000 lbs. during that month. The first appreciable amount of bellflower honey came in Nov. 28, the main flow from which lasted through December and January. We had an average hive on scales, and the following table gives the daily yields during the principal honey months.

In this table the daily gain is given in ordinary figures; the daily loss, in black; when there was no gain, nor loss, in ciphers; and days when we extracted from that colony are marked with an X. At the commencement of the honey harvest I selected three of the strongest and best-working colonies in the apiary, and carefully weighed all the honey taken from them. The total yields were respectively 31 $\frac{1}{2}$ lbs., 3.9%, and 280 lbs. each, during the four months from Nov. 1 to March 1. These were very strong colonies, occupied fully three stories, and, in fact, I do not think there were any other three colonies in the apiary that stored an equal amount of honey. From the 1st of February the yield of honey gradually slackened until the 1st of June, my estimate of the average gain of stores per colony being 8 lbs. during March; 3 in April, and 1 in May.

O. O. POPPLETON.

Havana, Cuba, June 1, 1889.

(Concluded in next issue.)

SHIPPING-PACKAGES FOR COMB HONEY.

A PROMINENT COMMISSION FIRM FURNISH SOME SUGGESTIONS.

REPORTS of the U. S. Honey Producers' Exchange as to condition of bees, and prospects of this year's honey crop, are very favorable and promising. The number of apiarists is continually increasing. It is expected that many carloads of fancy white-sage comb honey, put up in modern eastern style, will be shipped from California to our markets. In view of this increasing supplies, the important question becomes more pertinent: How shall we create more demand for honey? Our reply is:

1. Increase its intrinsic value for the consumer.
2. Reduce the risk of loss by breakage.
3. Make packages as attractive and handy as possible, of light-weighting material, at the least possible cost to the consumer.

When the consumer buys a pound of butter at 20 cts. he receives 16 ounces net. When he means to buy a pound of honey at 20 cts. he receives, in many cases, only about 10 ounces of honey, the in-

trinsic value of which, at the above rate, is only 12 $\frac{1}{2}$ cts., and 6 ounces of wood and glass or pasteboard, which is worth nothing to him. Nevertheless he has to pay 7 $\frac{1}{2}$ cts. for this nothing, and yet we expect more demand of that consumer. The lady who does not realize this fact may, unless she is one of the upper ten, at least get the impression that honey is quite an expensive luxury. Of course, the apiarist has paid for glass and wood and paper box, and spent so much labor and time to put up his honey nicely, and for this he expects to be remunerated, and possibly to make a little extra by the weight of the packing material. But what does the consumer care for all that, who simply wants his money's worth of honey? As all producers depend on the consumer at the end, our aim must be to satisfy the wants of the consumer. We propose, therefore, to use a light-weighting, attractive, and handy paper carton at the smallest possible cost.

As we have had the best opportunity to see and compare hundreds of different styles of honey-packages, we have selected the very best, and made some improvements, so that we may safely say that honey put up in this style will sell, first of all, at best prices, and give satisfaction. It is true, that glassed honey looks quite tempting, and that goods must be shown; but what we have said above is not only true, but it is also a statement of the true value. In order to show the honey, put one glassed comb in on each side of the crate, and the other combs in paper cartons. This refers to 1-lb. sections of fancy (No. 1), and fair (No. 2) white, and 1-lb. No. 1 buckwheat comb honey only; of 2-lb. sections and No. 1 buckwheat fancy white, two-thirds should be glassed (the glass weighing less in proportion), and one-third not glassed; 2-lb. sections of fair white, of mixed, and of No. 2 buckwheat and of 1 lb. sections of mixed and unfilled, should be without glass and paper, in order to reduce the cost, and know what the goods really are.

WHAT SHALL WE DO TO PROTECT OUR HONEY AGAINST BREAKAGE?

If eggs were not packed so nicely in patent paper boxes, or in chopped straw, most of the dealers would decline to handle those delicate structures. Is comb honey less delicately constructed? No, it is not; and for this reason some additional arrangements ought to be made in packing to prevent loss, and to avoid trouble, and to make the handling less sticky. Before comb honey reaches the consumer it passes through the hands of many persons who do not understand at all how to handle so fragile an article, and knock crates about, as if they were bricks. Besides, comb honey is generally shaken up so badly, when carted on the pavements of the streets in cities, that some of it is bound to break and to leak out.

One of our best customers, for whom a nice lot of honey had been smashed up entirely, said he would never touch comb honey again if he could help it, because of the annoyance and loss connected with that sticky article. We know of many similar cases where dealers became disgusted, and would not handle comb honey at all, because of the risk connected with the business. Remedy this by using Strohmeyer's comb-protector, which will prevent breakage; and if there should be one leaking comb in a crate, our comb-protector will prevent the soiling of the other combs. Our comb-protector requires $\frac{3}{8}$ inch more in height of crates. By using our attractive new style of paper carton

and comb-protector you will save labor, time, and expenses, and thereby be enabled to market your honey early in the season, when the best prices can be obtained. You will reduce the cost, decrease loss by breakage, but increase the demand, and consequently obtain larger profits.

F. G. STROHMEYER & CO.

New York, May 22, 1889.

All right, friends Strohmeyer & Co. Send us samples of your new improvement, just as soon as you can, and give us some pictures to give to our readers. You are exactly on the very track where we wanted to see you; and we can stand considerable free advertising, if you will just give us something practical, to prevent daubing and breakage.

MOVING BEES.

CAPITAL SUGGESTION FROM S. I. FREEBORN, OF
BASSWOOD FAME.

I READ with interest every thing touching on this point. I have often wondered if other folks had the trouble that I did, and were alive to the risks incurred in moving bees. It seems,

Mr. Editor, that others besides myself have found that bees and horses do not always harmonize. I can join with C. C. Miller in the sigh of relief in the fall when through moving bees; but for myself, I don't dread spring and fall moving as much as summer moving, when stocks are more populous, and weather warmer.

THE KIND OF VEHICLE BEST ADAPTED FOR MOVING BEES.

I have had occasion at times to move bees during every month in the year. I have moved by almost every kind of vehicle—wagons, sleds, buggies, spring wagons, and those without springs. I thought at one time that we should use springs, or put something soft under them, as straw or hay; but of late years I have put nothing softer than the wagon-box under them. I have tried several kinds of racks, but have voted them unhandy and cumbersome. I have simmered down to two wagon-boxes 1½ feet long, made double—boxes like those on farmers' wagons for hauling corn and other produce. We find these handy for hauling bees, apple-trees, and many other kinds of luggage. They will hold 12 double Langstroth or Gallup hives, or 24 single ones. We have 100 screens of the size of the top of the hives that we nail on after fastening frames and bottom-boards. We pack well with hay or straw around the hives, to keep them from rocking. In this way we have moved hundreds of colonies, and many times over as rough roads as there are in this county, and that is rough enough.

DISASTERS IN MOVING BEES; HOW TO AVOID.

Previous to last season, we had killed but very few colonies—probably four or five in 30 years. Last season we met our Waterloo, killing 16 colonies in one trip. Several causes served as helps to this disaster: The distance was considerable (24 miles), there was too much honey; the weather was very hot, and the colonies were extra strong. In our first trip of this move, we left in the full number of frames; in the next loads we took out five or six frames from each upper story, making them cooler, and furnishing an empty space to cluster in. The last moved had the advantage of being 6 miles nearer destination than those moved first, with the

additional precaution of less frames. We moved the last lot with success.

As an offset to the loss of last season, I will give a short account of moving 72 colonies in the summer of 1879, which was my first experience in moving to the mint (last of July, 10 miles distance). I wished to move the strongest colonies, many bees lying out. The question was, how to move such populous stocks and make it safe for them and the horses. We solved the problem by nailing some wire screens over empty hives, and fastening one on top of each colony moved, making them three stories high, with nothing but bees and air in upper stories. The experiment was a success, as we broke only one comb out of the 72 colonies in moving down, and did not get a horse stung at all; but we used every precaution to guard against the bees getting out.

SHIPPING BEES BY RAIL.

In regard to this matter I will say I am not authority, having done but little of it, and that only a short distance. I have lately been in correspondence with a gentleman who has been in the habit of shipping his bees from Missouri to Mississippi, to winter, taking in the early honey season there, and then returning in time for white clover in Missouri. He reported the venture as a success, but informed me that he had great difficulty in keeping his bees cool in returning. As they were then numerous, and the weather warm, he was obliged to use ice to keep them quiet enough to stand the trip. I have also been in correspondence with a man from Michigan in regard to

MOVING BEES FROM THE SOUTH TO THE NORTH, to take in the different honey seasons. His plan, as he wrote me in early spring, was to buy bees in Arkansas, take in the poplar and basswood harvest, then move north till he struck white clover in its prime; after clover, pack for Wisconsin and gather in clover, basswood, mint, and whatever else he could. I referred him to C. O. Perrine's venture on the Mississippi, and others, cautioning him of the loss of brood in long transits, and the difficulties of having bees in condition to gather an immediate harvest after a long trip. He has, I believe, modified his plans so as to take the early harvest in Arkansas, and be satisfied with what he can get in Wisconsin without stopping midway.

GETTING HORSES STUNG; AN INGENUOUS PLAN TO LOOSEN THEM FROM THE WAGON INSTANTLY, IN CASE OF EMERGENCY.

In regard to the danger of getting horses stung while moving bees, and the dire consequences that might follow, I can heartily join with Bro. Root in saying that C. C. Miller's caution is timely. Yes, I should say be careful. If a man needs to be cautioned when about to catch a mule by the hind leg, or a rattlesnake by the tail, then it will be in order to caution him about mixing bees and horses. There is one part of Miller's tactics that I think I will leave for you and him to practice—that is rubbing the horses' heads and noses when the bees are after them. I prefer to be at the other end, with a good hold of the lines. In the first place, I would emphasize the caution—when moving bees, don't leave the hives so they will leak bees; but if, by some mishap, they do get out, get bees and horses apart as soon as possible. To do this with all dispatch, we have our whiffletree-pins greased so they will pull out easily. We also have a piece of rope tied around the upper end, extending up to within easy reach of the driver; so in case of any stinging, the

horses can be detached in double-quick time from the load till things are righted. S. I. FREEBORN.

Ithaca, Wis., June, 1889.

You have hit it exactly. Have the pin that holds the doubletrees, made with a loop or eye in the top, and then hitch a stout rope to it that will not break, or, better still, a chain, and let the driver sit on the front end of the wagon, with the bolt between his feet. If the bolt is greased, as you suggest, and does not stick, he can jerk it out, even if the team were drawing on the doubletrees. With one horse, the whiffletree to the wagon would have to be arranged the same way; then fix the hold-backs so they will easily slip off from the thills, and the driver can skip, leaving the wagon behind at any moment, on short notice.

HONEY STATISTICS, ETC.

FROM ONE OF THE FRIENDS IN THE SOUTH.

FRIEND ROOT:—GLEANINGS, June 1st, is at hand, and you are to be congratulated on its beauty, valuable contents, and general completeness. The new feature, "Honey Statistics," is a most important one. I was surprised, however, to note the large percentage of "bees wintered," in the Southern reports, as experience in this section coincides with that reported from Louisiana, where a large per cent starved. Box hives, of course, and those governed by "kings," are the chief sufferers. The winter was so mild that bees were flying a large part of the time, and stores were consumed to an extent unusual. Leaving my apiary well supplied, and the hives equalized as to sealed stores, I was absent all winter. Returning I found one colony out of 26 starved—a very strong but *energetic* colony. Its energy was doubtless its ruin. Though this colony need not have been lost, and my "showing," as it was, a very fair one, still, a cold winter would have started things off in spring in far better trim for the honey season, while many box-hive men lost all, and many more from 50 to 95 per cent.

I use Simplicity single-story hives on summer stands for wintering, with some natural shelter (cedars) on the north. In this connection I will add, I use old pieces of ingrain carpet on top of the enamel cloth, on some hives, and on crates, when first placed; and I am satisfied in both cases it is beneficial, and I *know* a large piece of the same material thrown over the outside will cause bees to go into sections in cool weather when they will not otherwise.

I have obtained real clover honey this spring, to a very considerable extent—something unusual here. It was from white, alsike, and red, the Italians going $3\frac{1}{2}$ miles for the latter. Sweet clover is just coming in and promises great things, being 7 feet high, and the few blooms open are covered with bees.

MORE ABOUT THE BUTCHER BIRD.

The butcher bird Prof. Cook tells of is a familiar acquaintance of mine, and I have often seen him doing what the genial professor describes. A favorite tree is the honey-locust, on whose thorns this little butcher impales his prey. In my daily walk to the village I always see one near a thorn-bush that had been cut down and thrown into a gully. Only a few days ago I stopped a little friend

to show her a large grasshopper that I had just seen this bird transfix on one of the sharp thorns. When in Florida some years ago, one of these species used one of my young orange-trees to such an extent that it seemed to bear, as fruit, scorpions, lizards, small birds, grasshoppers, and the like, all at "one crop," so to speak. Wilson, Nuttall, Audubon—all, I think, speak of this trait in the great shrike.

LOSING CARP EGGS.

I can sympathize with you in the matter of losing carp eggs by the thieves, such as minnows, frogs, snakes, and turtles, and, I almost forgot, crawfish; and I am satisfied that, for those of us who are not expert pisciculturists, and who can not afford to drain often and have special breeding-ponds, carp culture will prove a failure unless some cheap, easy plan is adopted, by means of which the eggs and very young fry can be artificially protected till the young fish are large enough to care for themselves. Here is a plan I think cheap and practicable: Make a wire-cloth cage, as large as you wish (tacking the cloth on a wooden frame), having a door that will shut tight, on top. When the fish spawn, collect all the grass or other debris on which the eggs have caught, and place it in this minnow and frog proof cage, which should be put in shallow water. I take it for granted you know how to tell when carp spawn. It can be told by the commotion they make in the water the first warm weather. I always know, and see them. The above will succeed, for I have used a barrel this year, and hatched them successfully. Plenty of drift grass or straw should always be supplied for this purpose beforehand. My ponds are also flower-gardens, and it might interest you and some of your readers to know how easily such a spot may be beautified. I will only say, that if you should come this way some time I could place you on a diminutive island surrounded by flowers, let you thrust your fishing-rod through a "virgin's bower," drop your hook among the lily-pads, and land your tenth carp in a bed of pansies, if, in your excitement, your fish did not catch in a Marechal Niel rose, fifteen feet overhead.

C. P. COFFIN.

Pontotoc, Miss., June 7, 1889.

I am very much obliged indeed, for the additional facts you give us in regard to the butcher-bird; also your suggestions on raising young carp. I do know that all you say might be done; but just now I am watching and waiting for some boy who loves fish, just as you and I used to love to study about bees. When this boy makes his appearance, I am going to give him charge of my carp-pond, and he and I together, I am pretty sure, can raise carp as easily as our boys in the garden raise celery-plants. May be we could sell little ones at the same price, if we could only send them by mail. Your flower-garden in the middle of your carp-pond almost induces me to promise to pay you a visit. I have had dreams of such an island, but I didn't know that anybody had worked it out. My strawberry-bed alongside of Champion Brook terminates on the bank of the carp-pond, and I have long thought of having some flowers on the banks of the pond where the weeds grow so rampant; but I tell you, friend C., it not only takes money but brains to keep any thing of this kind nice. Perhaps your

island, covered with flowers, is just now a "thing of beauty;" but are you sure it will continue to be a "joy for ever"? If you keep it up, see if I don't come and see you one of these days; and, by the way, when you had those wee little carp in your barrel, didn't some sort of enemies, by some hook or crook, sooner or later get into the barrel also?

FALSE STATEMENTS IN REGARD TO THE HONEY BUSINESS OF OUR COUNTRY.

As a protection to our bee-keeping population, we propose in this department to publish the names of newspapers that persist in publishing false statements in regard to the purity of honey which we as bee-keepers put on the market.

A REPLY FROM THE PUBLISHERS OF THE BRITANNICA.

MR. A. I. ROOT:—Your favor of the 7th inst., in relation to the article on "Glucose," in the American Supplement to the *Encyclopaedia Britannica*, is received. We started an investigation immediately, and find that our author, Mr. Morris, has not, in our opinion, as good grounds for his assertions as he should have had. It is a matter of regret to us that Mr. Morris did not probe the matter deeper, and follow the rumors until he found either the truth or an error. It is also a matter of regret that you allowed this article to stand so long as it has, without calling attention to it sooner. This article was published some three years ago, and our attention was first called to it by Dr. Nysewander, of Des Moines, Iowa, under date of May 13th, closely followed by yours of the 7th of June. To us it is inexplicable how an article of this sort, which you seemed to be hunting in such sincerity, has been allowed to run so long without your discovering it.

We thank you for calling our attention to the matter now, and we shall have further investigation made, and correct the plates of our book, to correspond with the truth of the matter.

HUBBARD BROS.

Philadelphia, Pa., June 14, 1889.

Very good, friends. I do not know that we have ever before had so frank and fair an acknowledgment from the publishers of any book or newspaper in regard to this whole matter; and even though you have turned around on us a little, we do not feel hurt. In fact, we own up. Brother bee-keepers, it is a burning shame that not one among us had enterprise enough to notice such a statement until it had been three years in print. We shall have to give Dr. Nysewander the credit for having been the first one to see the false statement. Yes, we have been hunting with great "sincerity," but it seems that we did not alight on your publication before. There is one thing, however, that we should like to urge, if you will excuse us. You say you will correct the plates. Now, just have a printed slip of errata, or something of that kind, put into each book already published, and, as far as possible, sent to all who have purchased the work, and we shall be quite satisfied, and grateful to you besides. You speak about further investigation. We should be very glad indeed to furnish you the results of the investigations we have

made for the past four or five years. And now, brother bee-keepers, let us each and every one make it a point to consult the cyclopedias and all other works of that character, to see that the statements made are truthful, and that they do justice, both to the honey-bees and to the bee-keepers of the world.

"THOU SHALT NOT BEAR FALSE WITNESS AGAINST THY NEIGHBOR."

But, oh dear me! we have not got through the business yet, by any means. See the following:

Mr. Root:—Give the enterprising editor a "boost." Santa Monica, Cal., June 10, 1889. C. S. LEWIS.

Below is the newspaper clipping that came with the above.

THERE appears to be no limit to the adulteration and fraudulent substitution practiced with articles of food and drink. One might suppose that honey in the comb, at least, would be safe from humbug; but even this has been successfully imitated of late. Artificial comb is made of paraffine wax, and filled with glucose; and after the cell have been sealed with paraffine, the resemblance to the genuine article is perfect. This is an "advance" upon the older fraud of feeding bees with glucose, which the industrious insects proceeded to laboriously transfer to the comb.—*Marysville Appeal*.

Thank you, friend L., for sending us the clipping. Now, dear brothers of the *Marysville Appeal*, it is not the adulteration business that is so unlimited, bad as it is; but it is this matter of bearing false witness against your neighbor which is unlimited. We have mailed you one of our reward cards, and we hope you will be kind enough and fair enough to publish to your readers a retraction. We ask friend Lewis, and every other good bee-man, to see that it is done.

And now we find in the *Philadelphia Record* the following heading to a sensational article:

BEES CAN TAKE A REST.

THEY ARE NO LONGER NEEDED AS HONEY-MAKERS.

COMMERCIAL CUNNING MAKES THE COMB OF PARAFFINE AND THE HONEY OF GLUCOSE, AND THE PUBLIC CAN'T DETECT IT.

Below the above is one of the usual sensational strings of truth and untruth. Now, dear friends of the *Record*, we want to tell you that you are bearing false witness against your neighbor—an honest, industrious, and hard-working neighbor—a neighbor who has never harmed nor wronged you, but who has, in fact, been too busy earning his bread by the sweat of his face to think of damaging or injuring his fellow-man in the way in which you have injured and damaged him by your thoughtless editorial. The *Philadelphia Record* has for years been on our exchange list, and is almost daily on our table, and this makes us feel a little sadder than to see such statements in other papers which have not had the plain facts set before them every two weeks, year after year, as we have done for the *Record* folks. Now, dear friends will you not just take a little space to correct this wrong (although you never can do so fully), and do justice to an honest and industrious class of people?

And here is another piece of news (?) clipped from the *Sun*, of New York, printed

Sunday, June 9. Our stenographer suggests that, if they *must* tell lies, they do it on some other day than Sunday. Read:

The worst enemy of the honey-raiser is the producer of artificial and adulterated honey. It is easy to adulterate honey, but only recently have men become ingenious and skillful enough to make honey in the comb, both the honey and the comb being artificially produced. The spurious product looks almost exactly like that created by bees, and it is put up in the little square boxes, with windowed sides, like those used in hives. It is possible to detect the imitation, only by tasting it, by which test anybody who has a tooth for genuine honey can easily detect the fraud. The counterfeit is so skillfully executed, however, that it frequently deceives a novice. A New York man in a restaurant in this city the other night called for honey in the comb, and five boxes were purchased for him at as many different groceries before one of genuine honey was obtained. He then described the method of artificial honey-making, and in conclusion said that he was a drummer for a New York honey house.

Will the *Sun* people be kind enough to contradict the false statement they have probably unconsciously made in regard to their neighbors? We also send them one of our reward cards.

THE SAME OLD FALSEHOOD IN OTHER SHEEP'S CLOTHING.

The inclosed clipping was taken from the *Evening News*, Chicago, of May 29, 1889. ED HILE.
Muskegon, Mich., June 3, 1889.

MANUFACTURED HONEY; HOW ONE OF NATURE'S PRODUCTS IS SUCCESSFULLY COUNTERFEITED.

It is very likely the desire to be too quickly rich that makes the grocer sand his sugar, and the apothecary trifle with his life-saving drugs, and the weaver put cotton with his wool and starch with his cotton; but it hardly makes much difference to the consumer, those that suffer in consequence, what is the occasion of the act; it is enough for him, and considerably more than enough, that it is done. Yet when he finds the sediment of sand at the bottom of his coffee-cup he is glad it is there rather than down his throat; and he knows that if the apothecary has made the curative medicine too weak he has also diminished the power of the poisonous; and in general, fancying himself beyond the possibility of reaching or remedying the evil, he goes on submitting to it, thanks goodness it is no worse, that the air of heaven is licensed to no shop-keeper, and one has not yet succeeded in patenting the essential element of fire, so that he may breathe and keep warm without fear of adulteration. Two or three things besides, he has flattered himself, were beyond the coveting hand of greed; among them the egg, for instance, and the bee with that geometrical work of his which has for ages been doing all sorts of things with the brains of philosophers. Lately he has heard some dreadful suspicions as to the possibility of counterfeiting of the egg, but he dismissed them as absurdities. But when he heard that the honey-men bought glucose and set down a mass of it before their bee-hives, the bees at once accepted the benefaction, glad at heart to find their food close at hand, without the trouble of blundering about gardens and into blossoms, and no long flights to take on weary wings; he felt that at any rate it passed through the mechanism of the bee and got the tang and taste of honey, if it were not the expressed flower essence at first hand. But recently, says Harper's *Bazar*, he has received a shock in which the walls of his last stronghold have crumbled. There are new adulterators, if you will call them so, counterfeiters, what you will, who prepare artificial combs from paraffine as geometrical in shape, as waxy in appearance, and who fill these combs with clear syrup and seal them, so that apparently not even the bee could tell the difference between the false and the true. He sees with horror that the article sacred to sunshine and summer and poetry, to the Bible land flowing with milk and honey, to Sordello's song of Elys, is vanishing from the market and the table; and unless a man keeps his

own bees he may doubt if he is eating any thing but strained-glucose syrup at the time when he would like to be indulging in all sorts of fine and flowery fancies concerning his honey in the honey-comb.

And so it seems that even Harper's *Bazar* has gone into the enemy's ranks, and taking to bearing false witness against their neighbor. If any of our readers can tell us what issue of the *Bazar* contained the matter referred to in the above, we shall esteem it a favor.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

ORANGE-BLOSSOM HONEY NOT A MYTH; O. O. POPPLETON'S STATEMENT CHALLENGED.

I DID not know until recently, that there was any question as to orange-blossoms yielding honey. I have been in Florida five years, and have taken more or less surplus honey from that source every year; and if my bees had not been so weakened by moving from Wisconsin I could have taken it by the ton the first year; for a blossom, when shaken over the hand, would deposit a good-sized drop; and my bees, although mere nuclei, and too few in numbers to work in upper stories, filled their brood-combs to the exclusion of brood. I have this season taken 1000 pounds in one-pound sections, and 200 in broken honey. Most of the former I sent to Hildreth Bros., of New York, who sold it at 14½ and 15 cents per pound—not a fancy price, to be sure, but as high as white clover in the same market, to which it is in no way inferior; for its flavor (although different, of course) is as good and wears as well, while it is fully as white in color. I had 35 stocks in the apiary, and have 63 now. A friend of mine in a town near by reports having taken 100 pounds in sections from a swarm that issued in March.

After five and a half years continuous residence in Florida my family and self will this summer revisit the scenes of our childhood in Southern Wisconsin, where we hope to spend two months with old friends and neighbors. J. L. WOLFENDEN.

Evanston, Fla., June 10, 1889.

THE VALUE OF SALT, SOOT, LIME, ETC., ON LAND.

We had a pasture once, and nothing would eat the grass. We sowed about 600 lbs. of salt per acre on it. In a short time, both sheep and cows took it and ate it bare, after which a good grass came up. Salt is a good fertilizer on light land that is apt to burn up; so is lime or both mixed. Lime is a good fertilizer on land that grows much wheat or white straw of any kind, especially if it is deficient in the soil; 25 to 30 tons per acre has a marked and permanent effect. Soot is a valuable manure. There is a great deal used in England. The chimney-sweeps save all they get, and sell it to the farmers. Once I was going to put soot on a field that I thought needed lime, and I had both mixed in a room in the barn. The ammonia set free was too strong to make it pleasant staying in the room. After that I never mixed them, for ammonia is very volatile, and I concluded all that was set free was lost. When I first noticed the effect of soot as a manure, I asked the knowing ones where its manurial value lay, and I was told that it had no

actual value as a manure, but acted somehow in a "mechanical way." My experiment with the lime satisfied me. Lime should never be mixed with manure. It may cause a quick start, but the ammonia is wasted.

GEO. E. HALL.

Lyle, Tex.

Friend H., I have often seen soot recommended, and even liquid manure, made by stirring a small quantity of soot in a barrel of water; but I have always been much inclined to think that it was only a notion. In fact, I do not know that I ever tried soot at all. Now, when you tell me that soot mixed with lime gives off ammonia in the same way as does guano when mixed with lime, then I can understand it readily. But where does the ammonia come from? I supposed that soot is principally carbon, and that it is just about as good as so much charcoal dust and no more. Charcoal dust is valuable only as an absorbent; at the same time it makes the soil black so as to attract the rays of the sun. As soon as I can get hold of some soot I will test it in the way you mention.

MOISTURE IN HIVES; WHENCE DOES IT COME?

I received the oil-cloth covers per express to-day. Will you kindly explain to me why so much moisture is in my hives? I have 60 colonies of bees in various styles of hives, the majority being Simplicity, Langstroth, and American, and all of them have oil-cloth covers over the section boxes. We have had a very wet season for the past five or six weeks, and the section boxes in some of the hives have been perfectly soaked with moisture, while in others they are dry. Why the difference? Upon raising the oil-cloth at almost any time, it is found covered with great drops of water, apparently perspiration. This can not be from the evaporation of the nectar, for none or little has been brought in. The section boxes are so swollen in some of the Simplicity and Langstroth hives that they burst (partly) apart the T super, and I am obliged to open the hive after every shower to let out moisture. Have you had other complaints like this, regarding the use of the oil-cloth?

D. F. OGDEN.

Boulder, Col., June 11, 1899.

If it were in our locality I should say it was all owing to the exceedingly damp weather; but, if I am correct, you never have damp weather in June in Colorado. The oil-cloth, without question, has something to do with it. We have never noticed any such trouble as you mention, in the summer time, in our locality.

A NUT FOR PROFESSOR COOK TO CRACK; AN ACTUAL EYE-WITNESS TO A BEE BITING THROUGH THE TUBE OF THE WILD TOUCH-ME-NOT.

In GLEANINGS for June 1st, 1899, page 440, Prof. Cook says, "I do not say that honey-bees never cut into flower-tubes, but I feel very positive that this is the case." If my memory serves me right, it was J. L. Davis, of Holt, Ingham Co., Mich., who told me that bees would bite into the flower of what is here called the wild touch-me-not. Wishing to see it done, I went to a patch of said flowers, which was only about six rods from my house and a few feet from my bee-yard. Bees were quite plentiful on the flowers. My eye caught an Italian bee; he put his head into the open flower for an instant,

then he went to the bow end of the flower, which I saw had been bitten into by something. He took only a snuff at the hole, and darted to another flower, which was just right for me to see the whole operation in the flower. He went into the open end, backed out, and went to the bow end, and plied his jaws with a vim. With three or four bites he made a hole, and thrust his bill into it for about three seconds, and I followed him to two other flowers which were worked upon about the same by the bees. He visited several other flowers before he reached the last two flowers that he bit into; then I lost sight of him. This was some years ago. I have watched many times since to see them bite the same kind of flowers, but failed every time. There is no mistake in the above. J. L. LEWIS.

West Windsor, Eaton Co., Mich.

Well, I declare, friend L., I am now more than ever convinced that I was right, for I thought I saw the same thing you mention. I guess we won't change the A B C book yet, after all—certainly not until we hear from Prof. Cook in regard to the matter.

ALSIKE CLOVER, AND ONE OF ITS PECULIARITIES. THE VALUE OF THE STATISTICAL REPORT.

I notice in GLEANINGS that friend Gough thinks alsike is a cross between white and red clover. My experience with it has been, that, if it is pastured, or the soil becomes hard or dry from any other cause, it is very liable to look like white clover. I have a piece that has been sown for several years; although it has not been pastured, the ground is hard; and when it bloomed out first this season I think any one would have called it white clover; but since the excessive rains it has grown rank, and has a pink blossom.

I think the statistical report in GLEANINGS is worth the price charged. I have enjoyed reading your travels; and, in fact, GLEANINGS is good from beginning to end, and no bee-keeper should be without it. Bees are doing well here now, and the prospect is good for a good crop of honey, although there were some new swarms that starved the latter part of May.

J. T. VANPETTEN.

Linn, Kan., June 12, 1899.

SUNDAY SWARMING.

I had a rather singular experience with a swarm last Sunday (favorite day with my bees). They settled on a large limb in the top of a locust-tree, about 30 feet from the ground. It was too large to saw off. I succeeded in hiving them by using frames filled with comb. Pressing a comb against the swarm, I would wait until it was covered with bees, and then bring it down. Seven or eight trips sufficed to bring down all but a few. I brushed them off with a feather duster, and they followed down the ladder like a drove of pigs.

Crescent Hill, Ky., May 30, 1899. I. T. GAINES.

STRAWBOARD FOR T-SUPER COVERS, ETC.

In your foot-note to L. A. Duggan's letter, May 15, you say, "Very likely thick paper or strawboard would answer nicely for the inside of chaff hives." I have been trying strawboard T super covers this spring, $\frac{1}{4}$ inch thick, painted two coats. A few hours of rain will water-soak them so they will come to pieces; and I think even for the inside of a hive the moisture from the bees would soon ren-

der it worthless. Would not some kind of cement, molded in the form of a board, make good T-super covers, or plaster of Paris, if covered in cold weather? My board covers, with a shade-board over them, have to be loaded with stone to prevent twisting and curling up endwise.

Vienna, N. Y., May 25, 1889. V. W. TREMAIN.

The account of your experiment is valuable, inasmuch as it may save others, who had strawboard in mind, both time and money.

SUGAR SYRUP NEVER HONEY.

I will ask a question, and should like to see it answered in GLEANINGS by the veterans. One year ago last fall a friend fed two swarms with white sugar, after bee-pasture was killed, and the bees filled a great many sections of the whitest and most beautiful honey to look at I ever saw. He asked me to taste it. I did so, and I certainly would have taken it for honey; at least, there was quite a flavor of honey mixed with it. From what source came that flavor of honey? Can the most skillful chemist take the clover blossom and extract from it honey that will have the flavor bees give it? Bees will take the most bitter and ugly flowers, and extract from them a fair article of honey. You probably will say you can detect a flavor of the blossom; but how do the bees give it the flavor of honey?

La Otto, Ind., May 30, 1889. E. S. HANSON.

Friend H., you are making a mistake. Bees might sometimes make a fair article of honey from bitter flowers; but, as a rule, the honey is but slightly changed by being carried into the hive, except in the ripening process; and sugar syrup does not make honey. You made some mistake, or your people were careless in tasting. It has been tried by bee-keepers hundreds of times; and any one accustomed to the taste of sugar and honey will detect the sugar syrup at once. Even if it could not be noticed, it would not be profitable to feed the bees with it to get them to store it for honey.

PAPIER-MACHE FOR COMBS; LEMONADE SWEETENED WITH HONEY, GOOD.

Why couldn't the combs be made of papier-mache instead of wood? They could not absorb any more wax, and it certainly would not take any more wax per hive than foundation does. Did you ever sweeten lemonade with honey? We think it is nicer than sugar. Several who can not eat honey have drank the lemonade at our house, and felt no trouble from the honey sweetening.

Los Alamos, Cal. MRS. J. HILTON.

The objections to papier-mache instead of wood for honey-combs, is that the bees will every now and then, especially during a dearth of honey, go to work and tear the paper all to pieces; in fact, I have never seen any paper they would not tear up sooner or later in this way. They seem to imagine that any thing like paper has something to do with the bee-moth, and so they clean it out.

DISINFECTING CHAFF HIVES OF FOUL-BROOD GERMS.

I made my first chaff hive when 12 years old; but that horrible scourge, foul brood, got into our apiary. I say *ours*, for my brothers had bees as well as myself; and before we knew what was wrong, they

were in the last stages of foul brood, and nearly all died. We melted the combs, but the hives are all chaff hives, and it seems too bad to burn them. Now, will the hives need to be pulled to pieces and scalded inside and out, or will it do to scald the inside? Would not boiling water do as well as steam? Is there any danger in leaving the empty hives standing close to the apiary before they are scalded?

OSCAR TRUSSLER.

Strasburg, Ont., April 30, 1889.

It will not do to leave those infected chaff hives near the apiary for any great length of time. We suppose, of course, the entrances have been closed in the mean time. It is a very difficult matter to disinfect chaff hives. If you can get a kettle large enough, and can make sure that the water is brought to the boiling-point, you can disinfect the hive by removing the bottom and taking out the chaff, after which immerse them for about a full minute in the boiling water. I would keep them in the water as long as this, or longer, if you can conveniently, because the water is liable not to reach all the inside portions of the hive. We send you the latest edition of the A B C book. We advise you to read carefully the instructions on this point. We would say, in regard to chaff hives, that we have had very poor success in disinfecting them. We disinfected our last lot of hives by knocking them to pieces and burning them up, for we can make new ones about as cheaply as we can fuss with old ones, and then not have something as good, in the bargain.

CHILLED AND FOUL BROOD.

1. Is it a common occurrence in spring for a few scattered dead larvæ to be found here and there through a number of hives in the apiary, death being caused presumably either by neglect of the nurses or some disease, the larvæ flattening out and seeming watery and grayish? 2. If so, is it usual that, on arrival of the honey season, this condition ceases to exist, or will it, in a poor season, or with a weak colony, still continue, and probably develop into disease involving the ultimate destruction of the colony, with danger of infection to others?

R. W. McDONNELL.

Galt, Ont., Can., June 4, 1889.

1. The dead larvæ you describe are evidently chilled brood. The heads of the grubs first turn black, the larva shrinks, and finally settles into a pulpy gray or a grayish-yellow mass. If it turned to a coffee brown, and the matured matter were ropy—that is, tenacious, like spittle, it would have all the appearance of foul brood. While chilled brood resembles foul brood, it lacks the important symptoms; viz., ropiness and color. 2. Chilled brood can never develop into foul brood, which is always propagated by germs. Corn never grows where corn was never planted. Foul brood can never start without the existence of microscopic germs, called, technically, *bacillus alvei*. Chilled brood might be a better medium for the reception of these germs than ordinary living brood, providing that the spores were in the air. A weak constitution in the human family is more susceptible to the germs of smallpox or yellow fever than a healthy vigorous person.

ANSWERS TO QUESTIONS

FROM OUR A B C CLASS.

This department is designed primarily to cover questions either not already answered in the A B C of Bee Culture (price in cloth \$1.25), or, if incorporated in this work, are here dwelt upon more in detail on account of the importance of the question. While these answers are of vital interest to the A B C scholars, they will doubtless be found, in many instances, to be of considerable value to the more advanced student. For lack of space, the question itself, instead of being directly stated, is omitted, the same being implied in the answer. It is hoped that the class will first consult their text book before sending in their questions.

QUEENS FERTILIZED BUT ONCE.

J. D., Mississippi.—So far as our present knowledge extends, queens meet the drones but once in their lives. If a queen once produces Italian workers, she will always produce the same kind of bees.

TEXAS WHITE-CLOVER HONEY.

C. A. W., Texas.—Your sample of Texas white clover came duly to hand, and was tested. In color and body it is good. While better than the average grade of Southern honey as to flavor, it is not quite equal to the Northern clover, we think.

RUSHING OUT AT THE ENTRANCE.

H. L., Texas.—When there is a dearth of honey, feeding will always cause the bees to rush out to the entrance in excitement. The reason they fly out is because they are anxious to know whence comes this wealth of sweet, as it is evident to them that stores are coming in from some source.

WHY ARE THE BEES DYING AT THE ENTRANCE?

S. W. B., Ohio.—If your bees are dying at the entrance, and young bees are being carried out, it is pretty evident that they have been starving. Bees behave very much in this way when their stores are used up. The remedy, of course, is to feed at once, preferably granulated-sugar syrup.

A FRAME OF HATCHING BROOD, AND A FEW BEES, NOT A CURE FOR THE NAMELESS BEE-DISEASE.

H. M. H., New York.—Giving a frame of hatching brood and a few bees to a colony will not cure it of the nameless bee disease, provided the source of the trouble is with the queen. Her removal always effects a cure, and this proves pretty conclusively that the disease originates with her.

VIRGIN QUEENS SOMETIMES THE CAUSE OF AFTER-SWARMING.

H. F. G., New York.—A surplus of young queens immediately after the first swarm is pretty apt to give rise to a second swarm; and as long as there remains two or more virgin queens in the hive, there is apt to be swarming. Second swarms sometimes come out when the young queen comes out for her wedding-trip.

UPWARD VENTILATION; WHEN TO REMOVE PACKING FROM CHAFF HIVES.

C. B. W., Ohio.—Our chaff hives—at least the two-story—are so made as to provide for some upward ventilation through the chaff cushion. In cellar wintering, upward ventilation is not only unnecessary, but it is even detrimental. We remove our packing from the chaff hives soon after frosty weather and cool nights, which with us is about the middle of May.

WHY BEES SOMETIMES TEAR DOWN FOUNDATION.

E. E. S., Illinois.—The reason why your bees tore down the foundation is possibly due to the fact that

very little if any honey was coming in, when bees have nothing to do but to gnaw around the wires and get into mischief generally. If you want them to patch up the combs again, feed them, or remove the combs and put them in the hive again, when honey is coming in at a fair rate. Bees never gnaw holes in foundation when honey is coming in.

TO PREVENT SWARMING.

T. G. D., Ohio.—It is very difficult to prevent swarming when bees get the swarming mania, as yours seem to have. The only advice we can give you is to give the bees plenty of room, plenty of shade, and ample entrance; and we would advise you to cut out all the queen-cells but one. In eight days, again cut out the remaining cells that may be found. Perhaps you had better hive the old swarm on top of the old hive. As soon as the swarming fever is over, unite the two again.

CAN OLD HIVES, AND COMBS IN WHICH BEES HAVE DIED, BE USED FOR NEW SWARMS?

M. U., Ohio.—Those hives which you have, which are spotted with dysentery, and in which the bees have died, during the past winter, can be given to new swarms, or, in fact, to other colonies. The bees will very soon set things to rights. They will clean the dead bees out of the combs, and make the hives just as habitable as they were before. For further particulars, see "Wintering," in the A B C book; also "Dysentery."

HOW TO GROW BASSWOOD.

M. N. E., Michigan.—On p. 292, 1882, we published an exhaustive article on basswoods—when to gather seeds, how to grow the young trees, etc. It was written by Fr. Holtke, Carlstadt, Bergen Co., N. J. If you will consult some nurseryman, we have no doubt he will give you the information you require. Usually, young basswoods can be obtained in the woods. If they do not abound in your locality, you can purchase them of A. I. Root, Medina, O., who will send you small trees.

FULL-WIDTH ENTRANCE; THE HONEY-BEARD AND BRACE-COMBS.

H. S. B., Maryland.—It will be best to allow the full width of entrance, if you have a strong colony, or if the bees cover, say, 6 or 7 frames tolerably well. It is only weak colonies, and during a honey-dearth, that the entrance of a hive should be contracted. So far we have no practical method for preventing bees from building brace-combs between the brood-frames and honey-boards. All that a honey-board can be made to do is to prevent brace-combs from itself to the sections or surplus arrangement above.

SEPARATING ADVERTISEMENTS FROM THE READING-MATTER, FOR BINDING PURPOSES.

A. C. M., Rhode Island. We have thought of that same matter you speak of in reference to the make-up of GLEANINGS before; but on account of the rush of advertisements at the very last minute, and the necessity of getting in an important editorial or special notice, our reading-matter crowds in sometimes on to the advertising space; and the advertising space, on account of the large number of advertisements, sometimes upon the reading-matter. This condition of affairs is well nigh unavoidable; at least, we can not obviate the trouble without great expense, and we are not sure that the inconvenience it affords a very few would warrant

it. A great majority do not bind their periodicals at all. Only a very few even file their journals, and there is perhaps not one in 200 who goes to the trouble to tear out the advertising leaves, and have the journals properly bound in cloth covers. We can tell pretty nearly what this number is, because it is much cheaper for those who want their journals bound properly to send them to us, which they do. In referring, as we are often obliged to do, to old journals, we frequently find the advertising pages of as much importance as the reading pages. In one case, quite an important fraud was exposed and brought to a stop by consulting the advertising pages of old bee-journals. The first bound volume we found had had its advertising pages stripped off before binding. We finally succeeded, however, in finding this same journal, bound, advertisements and all. For files of old magazines or journals, saved for reference, I should by all means prefer to have the advertisements left in.

probably more a matter of mercy to the little cattle on sweltering summer days than an actual winner of dollars and cents. I am not quite sure of this, however; but it certainly pays to shade newly hived swarms.

E. E. HASTY.

With double-walled hives we prefer to set the hives in the sun. I think shade-trees are an injury. Our hive side walls are three inches thick; honey-board on top, $\frac{3}{4}$ inch thick. I put a cap over the hives, about 7 inches deep; roof boards $\frac{7}{8}$ inch thick. With that much protection from the sun there is no need of shade.

E. FRANCE.

No, nor anywhere else, providing the hives are painted white. Mine are all white that are painted at all, and I have never had any combs melt down, nor have the bees appeared inconvenienced by the heat. In one or two instances I have had the combs melt down in the unpainted hives, but not often enough to pay for shading them, in this locality.

G. M. DOOLITTLE.

Yes, by all means use a shade-board about two by three feet. I prefer this kind of shade for either an out-apiary or home apiary. I value it more highly than any other kind of shade. My reasons are given in my contribution to the *Review* for June, wherein will be found many articles from able writers upon the question of shade for bee-hives.

JAMES HEDDON.

I think it does pay to shade hives. It lessens the liability of melting the combs in very hot weather, and diminishes swarming. I use for shade on hives that stand exposed to the sun, about one yard of cheap calico, costing about 3 cents, tacked to two sides of a cover, and place the cover on top of the hive in such a manner as to leave an open space behind the cloth that hangs down on two sides of the hive. It is cheap and convenient.

H. R. BOARDMAN.

Owing to the construction of my old hives I never used shade-boards until the last two years on a different hive, and I have come to the conclusion that it does not pay to fuss with them. If there is honey in the flowers, the bees will be after it in full force, if the weather is as hot as blazes. If there is no honey, the bees might as well loaf on the shady side of the hive as to loaf inside. If you fear melting combs, don't use that kind of hive. A shade-board, to be of real use, should be made like a large umbrella; and even then every wind would disarrange them. In an out-apiary they would be a positive nuisance from the above cause. Let us let the shade-board go.

RAMBLER.

Bees, by fanning and partly vacating their hive, have, like the healthy human system by perspiration, the power of regulating the internal temperature. I find most danger of melting down combs while extracting or otherwise disturbing the normal condition of the hive. It seems to me the disadvantages of the shade being in the way, and its shading the bees when they would be better without it, overbalance all the good results where the thermometer does not go above 100° in the shade more than five or six days in the season. When the thermometer rises above 95° I should prefer to have some one present to elevate one end of the cover, or in some way assist the bees temporarily to ventilate the hive and save the bother and expense of a cover.

R. WILKIN.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 133.—*Does it pay to make any special provision for shade in an out-apiary, by means of shade-boards or otherwise, providing that the location does not afford trees or other natural shrubbery?*

No, it does not. GEO. GRIMM.

Yes. I prefer a shade-board. A. J. COOK.

This depends upon the construction of the hive. With our hive it pays. P. H. ELWOOD.

Yes. If there is not already satisfactory shade, I would use shade-boards. JAMES A. GREEN.

Yes, by all means. We make movable roofs, which improve the looks of the hives.

DADANT & SON.

I think it pays to shade hives from the full glare of the sun, both home and out apiaries.

O. O. POPPLETON.

Yes, where single-walled hives are used. With double-walled hives, or chaff, it is not necessary.

A. E. MANUM.

Yes, but much depends on location, the way the hives face, and how ventilated. S. I. FREEBORN.

Yes. I have tried the shade of trees, and also the shade-board, and much prefer the latter.

A. B. MASON.

It does. No combs will melt if the roof of the hive is raised only one inch to admit of an air passage over the inside body of the hive.

C. F. MUTH.

I have no doubt that it pays, as I have always noticed that those that were partially shaded did better than those fully exposed to the sun.

P. L. VIALON.

If the hives are painted white, probably not. If the hives are a dark color, yes. Place the hives in long rows, and have the shade in the shape of a roof high enough for a person to stand erect under it.

MRS. L. HARRISON.

I think this depends somewhat upon latitude and location. For the northern half of Ohio, shade is

During the hottest weather I think it may pay to use cheap shade-boards, or long grass, held on with a stick of firewood; and yet those hives which don't happen to have trees to shade them are generally left without shade, in my apiaries. I value shade comparatively little for the bees; but I want shade for the comfort of the operator, and could not think of locating an out-apiary where no shade could be had. My son, after reading the above, says Mr. Oatman would have given him a serious talking-to if he had omitted shade-boards, as combs would melt down if the hives were left unshaded. It occurs to me that an important difference in the two cases is that his hives are closed tight, except at the entrance, while mine have an opening at the upper back end of the brood-chamber, so that a current of air can pass directly through.

C. C. MILLER.

When doctors disagree, who shall decide? In reading the above, I have been quite a little amused, because I have at different times, in years past, decided in favor of shade, and then, again, I have decided that I would not have the shade if I could have it for nothing. My final decision has been, however, that the grapevines, arranged as we advise, are all the shade we need. During the spring months, when we want all the sunshine there is, there is no foliage on the vines; while during the great heat of summer, the foliage is most needed, and can be easily regulated then by clipping the shoots with a common sickle. I do not believe that we could ever be persuaded to bother with shade-boards, one for each hive.

QUESTION 134.—a. How much per colony do you estimate it costs to move bees to and from an out-apiary? b. Does the cartage of bees figure as any considerable item in the cost of honey production?

I have had no experience.

A. J. COOK.

I have had no experience.

PAUL L. VIALLO.

I have had but little experience in moving bees.

O. O. POPPLETON.

a. For taking and return, about 15 cents per colony. Better management might greatly reduce that.

b. Yes.

C. C. MILLER.

a. I have not had very much experience in this line, but I think 20 cents would be a liberal estimate. b. I think not.

JAMES A. GREEN.

The cost is a trifle, and the trouble involved lies more in the danger of damage to the combs and bees than in any thing else.

DADANT & SON.

a. I don't know. b. An inconvenience, as time is money, and expenses should be considered when making up the cost of production.

C. F. MUTH.

That depends upon the number of hives to be moved, distance, accessibility of location, etc. I should think that 50 cents per hive would probably be a fair average of cost of moving and returning.

MRS. L. HARRISON.

A man and team will move on the average about twenty-five swarms per day. Make your own estimate. b. The cartage is not so large an item as the extra trouble and expense after. Not many bee-keepers will stand it to ride ten or twelve miles per day and do a large hurrying day's work besides.

P. H. ELWOOD.

I have had no experience in moving bees to out-apiaries; but from what I have handled bees, I should place the cost at not far from 50 cents per colony for moving them five miles in the spring, and then back again in the fall.

G. M. DOOLITTLE.

a. In moving 105 colonies last year, 18 miles, both ways, it cost about 90 cents per colony, not counting the loss of those killed. Should we count the damage to the 15 swarms that were killed, it would make the expense of each about \$1.75. b. Yes, if moved far or often.

S. I. FREEBORN.

a. That depends upon the distance and condition of the roads, and conveniences for hauling. It costs me about 25 cents per colony to move bees to and from an apiary six miles away. b. Yes, the actual expense and loss of colonies (if any are lost) should be figured as expense to that particular apiary.

A. E. MANUM.

It depends very much on the size of the hives. Our hives, we can take only 12 colonies at a load. Then again the distance to move would make some difference. We don't move our bees home to winter. Our bees are all wintered on their summer stands. All the moving we do is to equalize out-apiaries, and to gather from the different yards bees to form a new apiary.

E. FRANCE.

a. It doesn't generally cost me any thing, for I have my own horse and wagon; but once it cost me a new dash to my spring wagon, and part of a tug to the harness, and over a mile walk, saying nothing about the trouble of combing the stings off my head. I had more hair then than now. b. As the cartage doesn't cost me any thing, it doesn't figure in the cost of honey.

A. B. MASON.

It depends very much on the skill or tact of the apiarist, the convenience for handling, etc. If I had to move all of my bees back and forth to out-apiaries twice each year I should consider it a big job. I have wintering-repositories at all my out-apiaries. I think it is impossible to answer the question definitely in the short space allowed. Bees may be moved quite cheaply, or it may be a very expensive work.

H. R. BOARDMAN.

a. It would not do for me to give you an estimate in figures, because so very much depends upon your location, the distance you propose to move, the roads, and the methods employed, and the price of such in your locality. b. Yes, the cartage of bees from one place to another in moving them after honey secretion, considered in all its lights, not only money outlay but attending dangers, labor, care, attention and all these things, is, in my judgment, always of more cost than it comes to.

JAMES HEDDON.

As I never had an out-apiary, my estimate can have no special value in comparison with the actual figures which experience can give—but, here goes:

Moving apiary of 20 hives—

Team 1 day at \$2.00 - - - \$2.00

Man 3 days at \$1.25 - - - 3.75

5.75

Same in returning - - - 5.75

Total - - - \$11.50

This would be one cent a pound on 1150 pounds of honey, and oftentimes the surplus they would gather would be less than that.

E. E. HASTY.

a, b. This depends upon distance and other things. It will cost from 10 to 15 cents per colony to move them a distance of 10 or 15 miles, fluring hauling, etc. It depends, of course, a great deal upon the condition of the hive and season of the year. In the spring and fall, when there are no supers to trouble with, I can prepare 20 colonies (one load) for hauling in about an hour. I always use a notched cross-bar in the bottom of the hive to hold the frames apart, and also have the ends of the frame rest in notches, so that all I need to do is to screw down the cover and tack a screen across the portico.

GEO. GRIMM.

a. With me a teamster has made ordinary wages in hauling my bees 20 miles for 12½ cents per hive. He would take on 80 hives with four horses and a trail (a wagon hitched on behind), at a load; but with me I would add another 12½ cents for preparing the hives to ship (I do not use close-fitting frames), and the disadvantages from bees, mixing up by change of locality. Besides this, and what would deter me from moving much more than the cost, is the dread of mishaps from teams, although I have been hauling them a great deal for the last thirty years, with no greater loss than the breaking of a wagon-tongue; but I know there is constant danger; but with two men (one of them a bee-man), with two horses easily detached from the wagon, they can be moved with almost positive safety. b. Ordinarily I would say, certainly not. R. WILKIN.

a. I winter my bees in a cellar at the out-apiary. There is no cartage expense. If they were brought home, the cost would depend on many things—time in preparing bees for cartage, number of colonies to be carted, distance, and whether one or two horses, etc., were employed. As I fix my hives for carting, I would estimate the cost of moving 100 colonies to and from the home yard at 15 cents per colony, for a distance of not over five miles. b. I do not consider the curting much of an item. I would itemize the foregoing as follows, from the home apiary:

33 hives at a load, distance 5 miles, cost of team per trip, \$2.00.	Three loads,	\$6.00
To home apiary,		6.00
Two hours' work preparing 33 swarms for cartage, about 4 minutes to a swarm, 25 cents per hour, or for the 100 colonies for two movings,		3.00

Total - - - - - \$15.00

The above team's work, I think, could be done even cheaper for the distance, in my locality.

RAMBLER.

The above seems to cover the whole ground so thoroughly that I do not know that I have any thing to add. I was quite interested in what R. Wilkin has to say; for in California they do a great deal more moving of bees than we do; and it will for ever remain a mystery to me how they carry bees up in the canyons, especially such a one as I first passed up in company with friend Wilkin, and Mr. and Mrs. Mercer. It seemed to me that the only way to get up there was to carry one hive at a time, by hand, through the worst places. Our folks here in Ohio would have said, without hesitation, that it would be madness to think of driving a horse and buggy through such passages, leaving bees entirely out of the question.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

Please do not forget those apple-barrels that were the shape of a stovepipe. Please tell Ernest to give us Our Own Apiary at least four times a year.

Dorr, Mich.

JOHN SHORT.

COCKROACHES.

Mr. W. L. Coggs, West Groton, N. Y., sends me some cockroaches, with two of the egg capsules. He asks me to give habits, etc., through GLEANINGS. As I have already done so on p. 882, 1888, it is not necessary to repeat it. They are doubtless about his hives for warmth and shelter, and possibly for honey.

A. J. COOK.

Agricultural College, Mich., June 5, 1889.

O. O. POPPLETON AND THE ORANGE-BLOSSOM HONEY.

I protest against the statement made by Mr. O. O. Poppleton, regarding orange-blossom honey, page 444. It is the *surest* crop of honey of any during the year; but bees are not always in condition to store it in great quantities; but it always starts a boom in brood-rearing, and with me it is the best season for queen-rearing. They worked 6 weeks on it this spring. The conditions were good. I have had 5 years' experience.

NELLIE ADAMS.

Sorrento, Fla., June 5, 1889.

ARE BEES TAXABLE PROPERTY?

Are bees taxable? I am the assessor of this township. I was also assessor last year. I have not listed bees for taxation, neither have my predecessors. I told the preceding assessors they were not. I gained that impression from GLEANINGS.

D. P. LISTER.

Lac-qui-parle, Minn., June 10, 1889.

[We have for a good many years paid taxes on our bees. The matter was discussed at some length in GLEANINGS several years ago. Doolittle and some others thought bees should not be taxed, while I took the ground that they were just as much property as horses, sheep, or cattle. In some places they tax them and in others they do not. I prefer to have our bees taxed, because it gives me a clearer conscience.]

FROM BOOMING TO DOING NOTHING.

I wrote you last week that "bees were booming here." They were at that time; but the very next day the weather changed from warm and pleasant to cold and wet, and the bees have done nothing for nearly a week. Hence some of my neighbor bee-keepers are getting a little "blue;" but, not I—oh, no! I have lots of courage yet in reserve, hence I am hoping, and shall continue to hope to the last.

Bristol, Vt., June 10, 1889.

A. E. MANUM.

ON THE VERGE OF STARVATION.

Bees have been on the verge of starvation for several weeks during the continued cold stormy weather that has prevailed. Many have actually perished, and those not actually dead are badly demoralized. I have visited a number of apiaries, and find this condition prevailing everywhere. White clover is coming forward now, so that they are getting enough from day to day to just barely keep the wolf from the door. Careful watching and feeding has saved mine, but not without considerable damage.

H. R. BOARDMAN.

East Townsend, O., June 11, 1889.

RECENT DEVELOPMENTS

CONDUCTED BY ERNEST R. ROOT.

THE DOVETAILED HIVE FOR SHIPPING.

ON pages 468 and '91 incidentally referred to the special fitness of the new Dovetailed hive for moving and shipping bees. When we changed from the beveled to the square edge, we had no idea (*we* means Mr. Warner, Mr. Calvert, and your humble servant) that the square edge made the hive better adapted to moving bees. Why so? In the first place, the bottom of the Dovetailed hive can be made permanent or movable. For the purpose of moving to the basswood orchard, we have been having all the bottoms secured to the hive by means of two screws, one on each side and centrally located. Two wood screws were found to hold the bottom very securely. With the beveled-edge Simplicity, it is practically impossible to fix the bottom on account of the beveled edges. After the bees have been moved in the Dovetailed hive and it becomes desirable to raise the brood-chamber up, or in any case where the removal of the brood-chamber becomes necessary, all we have to do is to tip up the hive, and with a screwdriver remove the two wood screws. Propolis will hold the bottom-board and hive together during the operation. The hive is then set back in position, when a screwdriver will readily loosen the bottom-board. Having obtained some photographic views I will now proceed to give you a more detailed description.

THE DOVETAILED HIVE PREPARED FOR SHIPPING BEES.

In the cut, the bottom-board has been secured by the screws referred to. The entrance is closed by a piece of wire cloth of suitable length, and folded longitudinally through the middle. For moving short distances, two or three tacks will secure it. When shipping by express it is better to use a number of tacks, as shown in the engraving.

The wire screen is simply a section of the Dovetailed hive cut off so as to make a rim $1\frac{1}{2}$ inches deep. These rims are made from dovetailed sides and ends which are defective, either because of knots or checks. A piece of wire cloth 26 inches wide is cut in two in the middle, longitudinally, making a strip of just the right width to tack upon the rim. In the center of each side to the rim, a screw-hole is made, and the screen is

secured to the hive by two screws, B, B, as shown in the engraving. There is no tacking, pounding, nor driving of nails when putting on the screen, nor, in fact, when removing the same.

To secure the frames from shucking about, we use a notched stick, shown at A. One of these strips is tacked to the bottom-board, notches upward, to space the bottom-bars; and two of these strips are used at each end above the frames. The strips are of the right width to fill up the space taken out by the rabbet; and when the wire screen is screwed down, these strips are held by the end pieces of the rim. In the engraving, the notched sticks are represented as being nailed to hold them securely. In shipping by express this will be a necessary precaution; but in ordinary moving, the screen itself, with the usual amount of wax and propolis, prevents the strips from coming out of place. To give you a better idea of fastening the frames, the enlarged drawing below has been made.

The notches, A, A, slip down between the spaces in the frames X, etc. It may be asked in this connection, why we do not use the spacing-boards which we have advertised for some years back. Principally because they were too much trouble. In each hive six boards were required, and these are to be nailed on the ends on the inside, three at each end. On account of the usual amount of propolis and wax that is deposited upon the sides of the frames, we find it a very difficult matter to shove the end-bars down into these longitudinal grooves in the spacing-boards. The operation becomes still more difficult after the bees have fixed them with propolis. Some of the worst cases of robbing and stinging we ever had were brought about in the effort to remove the frames from the spacing-boards. When I come to compare the ease of manipulation of the notched sticks I almost wonder that we did not discard the boards sooner. The time occupied in preparing some 20 or 30 hives for shipment, or for moving, is now reduced to a minimum, and we are sure that our customers will welcome the change.

I am aware that, for all wood frames, and for ordinary moving to out-apiaries, the spacing-strips will not be absolutely necessary; but as the frames we moved were metal-cornered, and as it was early in the season, before brace-combs were built out, we found that the spacing-sticks were necessary. They are certainly necessary in any case for shipment by express. If the Hetherington-Vandeusen frames are a success we shall not need the spacers at all.

P. S.—Of course, it will be understood that the notched sticks—in fact, the whole arrangement above, is old; but it is good just the same. Such bee-keepers as A. E. Manum use the notched stick.

MYSELF AND MY NEIGHBORS.

Thou shalt love thy neighbor.—Lev. 19: 18.

YOU may wonder why I did not add the customary "as thyself." But I prefer to leave it off—at least just now—because it seems to me that this old command has been repeated so often that it falls on the ear almost without effect. Another thing, quite a large class of humanity smile, or sometimes laugh outright; and others go even so far as to jeer and throw ridicule whenever the subject is mentioned of loving *anybody* as a man loves himself. People say, "There can't anybody do it;" and, again, "Nobody ever did do it;" and, "It is all humbug," etc. Perhaps some of these friends forget that Christ Jesus did actually, through every moment of his life, love his neighbors *more* than he loved himself. Well, mankind will have to have their own way, I suppose. Those who ridicule this little text, however, are, I believe, without exception, bad, selfish men. They oftentimes say it would be a good thing if people *would* actually love others more and self less, and then they go on and tell about pretense and hypocrisy, and they say we Christians do not have any more love for our fellow-men, when we come right down to it, than other folks; and I think very likely we need a great deal of exhortation in this very line. All I am going to ask you to-day is that you shall love your neighbor. If he is not lovable, love him as much as you can. If he hates you, even then the best thing you can do is to love him. If he is hateful and abusive, do not get weary in trying to soften him by kind acts. Do not pay any attention to his unkind words or spiteful actions. Try to love your neighbor, whoever he may be. Yes, try to love *all* your neighbors, and to do them good. If something happens that is going to take money out of your pocket, try to see if it does not put money into the pocket of somebody else, and be happy because of the good it does *such* a one. I know what it is to get into a strife to see who shall get the most trade and make the most money; but I know, too, that we can fight down this natural desire to accumulate ourselves, and find a far greater happiness in seeing our *neighbors* accumulate and prosper and do well.

I have said considerable of late about low prices. I have suggested to you, that, if you received only from 10 to 15 cents a bushel for your potatoes, some neighbor of yours got his potatoes exceedingly low. You may urge that there is reason in all things, and that a man can not be very happy and feel very pleasant when he does not get enough for his produce to pay the cost of production. Yes, there is truth in this; but for all that, when circumstances make it necessary for you to sell to your neighbor something for less than it actually cost you, you can still congratulate him on his good fortune. Your loss is his gain. Another thing, we Christians have the promise that, if we seek first the kingdom of God, and his

righteousness, all things else shall be added unto us.

I told you, June 13, that we were getting 15 cts. a quart for our strawberries. Just after our journal went out, however, the boys on the wagon reported that we could not sell them as fast as they were picked, unless the price came down. So they came down to 14 cents; then to 12; then to 10. Each decline started a fresh run on them for perhaps a day; but when people began to find that the berries were dropping regularly each morning, they very soon began to take it for granted that it was to be the regular programme, and so they would not buy to can until they got lower. When they got down to 8 cents I thought that was low enough—we certainly ought to have 8 cents for such nice berries. But as people would not buy the 10 or 12 bushels we were picking, at 8 cts., what was to be done? We had had some experience in letting a lot lie over, and that certainly did not pay. Our customers were beginning to say, "If you will give me some that were picked this morning, I will take some; but I don't want any that were picked yesterday." Some went even so far as to decline having any in the evening that were picked the same morning. We remonstrated; but they knew we were picking all the while, and they preferred those which had been only an hour from the berry-patch, and that had not been jolted around on the wagon. There was no help for it. We were obliged to carry a few at a time, sell them off, and then go back for more, thus making quick work from pickers to consumers. This state of affairs rendered it still *more* necessary that the berries be made to go off at *some* price. Well, they went down to 7 cts.; then to 6; then to 5 cts.; and one day I felt a little blue when the boys declared that the whole town of Medina (2000 inhabitants) would not take all the berries we were picking, even for 5 cents. They suggested shipping them off somewhere. Now, my experience in shipping off garden stuff has not been very favorable. Sometimes it sells for enough to pay the express charges, and sometimes it doesn't. The berries *must* be sold in Medina. Mr. Weed suggested that, if we could get rid of what we had on hand, maybe we could keep our heads above water. I accordingly went round to the hands in the factory and asked how many wanted some nice strawberries, just picked, for only 5 cts. I looked pleasant and good natured about it, but there did not seem to be any demand, even at this very low price. I have been told that some said they guessed the berries would be lower still than 5 cts., next day. I confess I was inclined to feel a little bit discouraged, and I don't know but I did suggest to my wife that I would plow up part of my vines and not raise so many berries, especially as it seemed evident that we were raising too many for our small town. I had not yet read friend Terry's article, which you will find on another page, in regard to this matter; but when I did read it, it caused me to smile. My wife suggested that our beautiful berries, instead of affording me recreation and enjoyment, were adding to my

cares, and making me look worried. It would be a little sad if *strawberries* should be the means of *adding* wrinkles to my face that is already pretty well furrowed. Some of you may say, "Surely A. I. Root would, at such a crisis, have taken his cares and perplexities to the kind Father; for, in fact, he taught just that in his book, 'What to Do,'" and with all the advice that this world can furnish in regard to what to do in perplexities, is there any thing to be compared with that beautiful injunction, "Cast thy burden on the Lord"? As soon as I thought it, however, I began to be a little ashamed of myself. If I were a poor man, on a little homestead, with a mortgage hanging over me, and I were depending on my berries to help to lift the mortgage, then I might complain about getting only 5 cts. a quart. If sickness and death were near, and money were needed to pay the doctor's bill, then might I pray God to help me to get better prices. As it was, I actually felt ashamed to ask the kind Father for any help at all in that direction. I did ask him, however, to help me to feel happy and glad because I was able to give nice fresh berries to my friends and neighbors for only 5 cts. a quart. Well, the prayer was answered very speedily. I became glad and happy "straightway," as Mark says. My daughter Constance (Blue Eyes, you know) has been taking me to task for using the word *got*. It came in once or twice in my last Home talk, and she says it is not "good grammar." Well, whether it is good or bad, I "got" happy. I really enjoyed selling berries for 5 cts. Then what do you think happened? Somebody, I really don't know why, suddenly concluded that the berries might not get any lower, and ordered half a bushel at 5 cents a quart. Then another neighbor thought they would take the chances, and take theirs for canning at 5 cts. And pretty soon somebody suggested that the berries would come *up* very soon. Now, you may think it strange; but within an hour we engaged more at 5 cts. a quart than we had to spare; and pretty soon the young man who superintends the children who are doing the picking, told me they were not going to have as many as they *had been* getting. By the way, this young man is one of the printers. It is a rather dull season just now in the composing-room; and as he had often begged to get outdoors we gave him this post. You ought to see how we have tanned him up during the last ten days. He seems to prefer to be outdoors, however, for all that. Well, after we had taken as many orders as we dared to at 5 cents, we took some more at 6. Meanwhile the people had "got" an idea that the price of the berries was running up again, and everybody was in a hurry to buy. Up they went to 7 and then to 8; and then came the state of affairs where we charged one man 8 cts. for his berries, and the other 6 or even 5, because they were to fill an old contract, made when the berries were low.* This taught us not to make any

more contracts. So the men on our wagon told the customers, "We will pick and deliver them any time you wish, but we can not agree on any particular price. You can have them *now* for 7 cents; to-morrow they may be 5, but they may also be 8 or even 9." This little transaction has tended to give me more charity for people who change prices often. In fact, it gave me my first insight into this matter of fluctuations of the market, and it led me to see that it is proper to change the price not only daily, but, under some conditions, and under some circumstances, hourly. When the prices were low, it was really pleasant to see people coming with all sorts of utensils for strawberries; and I believe now that I enjoyed selling them as much (or even more) at 5 cents as I did selling them at 15. All that prevented me from being pleased and happy on the "down grade" was because I hadn't got enough of the text, at the head of this little sermon, in my heart—"Thou shalt love thy neighbor." And I confess that, when prices began to go up, and the children and some poor people who could afford them at 5 cents, but could not at 10 or 15, I began to feel sad for *their* sakes. My friend, when your neighbor's interest is so much in your heart that you *forget self*, and rejoice or feel sad at *his* loss or gain, you are getting pretty near to the kingdom.

Well, we got on swimmingly, and I enjoyed harvesting the berries very much. I enjoyed this matter of demand and supply, and fluctuations in the prices, and especially the positive proof that Medina could not only take care of 15 bushels of strawberries a day, but perhaps twice or three times that amount, until Saturday night came. We had had some little experience with Saturday night, but not very much. The weather was favorable, and, oh how the berries did ripen! Before we got through the patch once they were riper where we commenced than they had been when we started. Some of the boys talked toward night of picking no more if I could not sell them; but I told them that the berries must be picked, and that they must be sold or given away. The wagon went all over town, and visited every customer of ours; but after the men returned late in the evening, there were four or five bushels of berries yet to be disposed of. As our baskets all became full, the pint boxes full of berries were scattered everywhere along the rows, and little patches here and there were seen in groups up by the fence. In fact, bright, beautiful luscious strawberries stared at us everywhere. There had been such a hurry to get them picked before night, that they were set around everywhere, and nobody knew what was to be done with them. There was some talk of carrying the pint boxes by hand, because the *baskets* were all full; but I suggested setting them on one of the shutters of the hot-beds. Finally Mr. Wright, the printer, got hold of some of the shallow trays we use for celery-plants. To refresh your memory I will give you a picture of one.

Each tray holds 24 pints. They were wheeled up to the factory on our Daisy wheelbarrows, and then they were set along the front of the door, on a stand that was

*At one time, to fill our contracts we tried to buy some berries of a neighbor; but the best price he could make to us was 6 cts., therefore we should be obliged to pay 6 and sell for 5, because we were so thoughtless as to make a contract beforehand, for the delivery of berries the next day.

THE TRAYS WE USED TO HOLD OUR PINT BOXES OF STRAWBERRIES.

made to exhibit new goods. They made an impressive show, I tell you. I proposed to sell what I could, to the people who passed by. Ours is a public highway, and on Saturday night there were more or less vehicles passing almost constantly. My wife suggested that we should mark in plain letters, on a nice clean smooth board,

FRESH STRAWBERRIES, ONLY 5 CENTS A QUART.

Ernest got a board and did the marking, and I commenced calling the attention of the passers-by, when they did not seem to notice the berries, myself. Somewhat to my surprise a sale was made to the occupants of almost every vehicle. Pretty soon it became too dark to see, but there were bushels of berries remaining. At this juncture Mr. Weed brought a large lamp from the factory, and set it near by the bulletin-board. Well, before ten o'clock every berry was sold. The people went away happy, and I felt happy, even if the coppers and nickels in my pocket did pull down rather uncomfortably. The coppers and nickels would keep over Sunday, without spoiling, even though the weather were hot and damp, while the strawberries—well, I felt sure they would do good, and make people happy, at only 5 cts. a quart.

Now, then, friends, I have told you this little story because I think likely it will be helpful to some of you in selling your products. A plain bulletin-board, a good display of what you have for sale, assisted by a lamp, if it is a still evening, after dark, makes a very pretty advertisement. Back of it all, the owner must stand, with *love to his neighbor*, in his heart. All the rest will take care of itself. Now, whenever you are inclined to murmur or complain—when you say farming does not pay, or the special occupation whereunto God seems to have called you does not pay, please have confidence enough in your old friend A. I. Root to believe he is right when he says the trouble is not in *farming*; it is not in your *chosen occupation*, and it is not with your *neighbors*—the neighbors God has given you, but it is because in your own heart you do not “*love your neighbor*.”

P. S.—Constance suggests that it is not dignified, and she does not think it is the thing to do, to speak to people who are riding by, no matter whether you know them or not, and ask them if they don't want to buy some strawberries. She thinks it is too much like peddling. I told her that I should never object to seeing peddlers, provided they carried some product of the soil that they had raised themselves. Some of the friends laughed at my zeal in disposing of the berries, but none of them seemed to be displeased. Toward the last, a buggy went by in the dark. I could not see very distinctly, but after he had replied very sober-

ly and sedately that he did not think they could very *well* use any more strawberries just then, we found out that it was my son-in-law, *Mr. Calvert*. This raised a pretty big laugh from the bystanders; but I was so very enthusiastic in disposing of the great lot of berries, that I proposed to treat friends and foes (that is, if *I have any* foes in Medina County) all alike.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

TOO MANY STRAWBERRIES, SMALL FRUITS, ETC.; FRIEND TERRY GIVES US A LITTLE FRIENDLY TALK IN THE MATTER.

MR. ROOT:—In GLEANINGS for June I spoke of the overproduction of potatoes, and the prospect of an overcrop of strawberries. Now, do you know I was almost provoked with you for not making use of such a good opportunity to preach a little sermon on my special hobby? For forty years to come there will be no danger of overproduction among the farmers (and many bee-keepers that I have met can be added in), in the line of growing abundance of strawberries and other fine small fruits for their own home use, and I know of no work in the world that they ought to be more happy while doing. I am getting more and more in love with my fruit-garden, as well as with the delicious fruit we are getting. Would that I could take every reader of GLEANINGS, who is behind at all in this respect, by the hand and have a full hour's talk with him while walking among the loaded bushes and vines in my garden or yours! Wouldn't I talk my best at him? Wouldn't I keep his mouth full of great Jessie, Bubach, and Cumberland berries? Then I would try to interest him in the growing of vines. I would show him single leaves 5 inches long, one of which would cover a pint bowl, on plants set this spring; then take him among the raspberries, and show him bushes, set only a little over a year, loaded with berries.

Some farmers have a little bed of strawberries, perhaps two or three square rods, from which they get just a taste of this great luxury. That wouldn't suit me at all. I would set out ten times as many, with an ordinary-sized family, and tend them in long rows, with a horse, and have berries by the bushel, as free to children and all as water, for a month if possible. We have now a bushel a day of splendid fruit, and we eat and can every one of them. (No, I took much delight in carrying a peck to a neighbor, yesterday, who doesn't have any.) Extravagant? What! when I and the family did all the work on them, and if they were together in solid compass (they are between raspberry rows you know) they would hardly occupy more than 15 rods of earth? I don't think so.

I saw Mr. Fenn at the Horticultural Society in Tallmadge, the other day, and he told me about your rows of strawberries. I do wish I could see them. Won't you tell us how far apart in the row you set the plants, and when you get through, about the average yield per hill?

The Bubach is our grandest berry. The Haverland is not so large, but extra good size, and the berries just lie in piles. The flavor is not quite perfect, to my taste; but with 13 kinds, I may be get-

ting rather particular. There is no berry on our grounds with any nicer flavor than the old Charles Downing; but they are light yielders, and easily hurt by the frost, like the Sharpless. The Jessie is good, and a fair yielder, but not up to the Bubach.

Do you know I had to laugh when I read in GLEANINGS that you were not quite certain that farmers could not afford to grow potatoes in a small way where they hadn't the machinery and aids of the large grower? What do you suppose I had been doing that morning? Why, following Breed's weeder, as a new tool is called, over seven acres of potatoes. It was drawn by one horse, and could hardly be called work for him or myself. Now, what did it do? Why, in going once through the field I stirred all the soil that I could with a one-horse cultivator in going twice, and at the same time moved every bit of soil in and around the hills—hoed them. In the afternoon, wife and I took a ride. We saw a man with perhaps two acres of potatoes, hoeing them slowly by hand, after having cultivated them. We calculated that, at the rate he was working, it would take him one day to hoe half an acre (in drills), or over 15 days to do the work I had done in the forenoon. Which can ride out the most? which can get time to "fuss" with berries best? Which can get the most time to do his work promptly and as well as he knows how, and can live and respect his calling instead of being a drudge?

But, enough. You know I love to accomplish something when I work. Don't fear the overproduction of potatoes. There are two sides to this. When farmers get large prices, how many thousands of poor people have to pay altogether too much? Welcome cheaper production and only fair living prices for farmers, for the sake of the great number of poor people who will be helped. With our machinery we made money last year on potatoes—did well enough. It hurt me to sell potatoes to men who had hard work to make a very bare living, for 75 cts. to \$1.00 a bushel in 1881 and 1887. To be sure, it was market price, but—well, I found a way to ease my conscience, sometimes, when selling directly to individuals.

Dr. Talmage says the Almighty will smite this people if they do not stop inventing machinery to take work from poor people. For himself, he says, if I remember correctly, that he hopes there will not be another tool invented in 500 years. But he is all wrong for once. His head is out of level. Flour and potatoes are cheaper to-day for the poor man to eat than they would be without the binder and the potato-planter; and there is work enough for all, and better wages, than in anti-machinery days. Then see the great saving to the farmers' wives in the line of less help to board, less drudgery and tavern life, and the nearer approach to a perfect home. See how the farmer can now accomplish much without slavish toil. Welcome to labor-saving machinery, I say. T. B. TERRY.

Hudson, Ohio.

Well, I am very glad indeed, old friend, to know that our ideas have been so much in the same line. You will, of course, see what I have said under the head of Our Neighbors, in this issue. I do not know that I quite get your thought in regard to farmers raising small fruits. Where they raise strawberries for sale, I think they might devote more ground to this one crop

than is profitable for *that locality*. Last season we had so many Alaska peas (and we got them on the market before anybody else had any also) that they could not be sold without running the price down to a point that did not pay expenses; and even when we loaded the wagon and sent them off eight or ten miles to adjoining towns, the whole crop could not be sold at a profit. I made a blunder by planting *largely all at one time*. This year I blundered the other way, because I did not plant enough. For three weeks we have been getting 50 cents a peck for every pea as it ripened, and customers quarrel as to who shall have them, even then. We had only about half enough. The remedy is to make successive plantings every week or ten days, and be sure to have enough, and not very many more than enough. We can not do this, however, with strawberries. If you mean, however, that no farmer or anybody else who has a little patch of ground can make a mistake by planting enough to give his own family a great abundance of strawberries, then I *heartily* agree with you. Almost every spring my health begins to fail by care and overwork, just a little before strawberry time, and for several years I have been looking forward to fresh strawberries as a sure means of "fetching" me up. This year I was in such haste to receive the benefit of the "strawberry tonic" that I ate a little too freely of them when they *first* ripened. I began to feel troubled for fear strawberries would not work *this* season. I soon found, however, that it was because dame Nature did not want the new medicine too abruptly. By increasing the dose daily for a few days, I *soon* found that I could eat two large saucerfuls at a meal, and ever so many more between meals, and grow fat and happy on them. Of all the different "cures" that have been invented in times past, give me the strawberry cure. Well, now, there is but little question but that other people will be benefited just as I am benefited. But they can not very well afford the expense unless the berries are afforded cheaply; therefore I am glad, as you are, when strawberries (and potatoes) are offered at very low prices. But I still think that, where one wishes to get the very most benefit from strawberries, he should raise them himself, not only that he may enjoy seeing them grow, but that he may feel that the supply is unlimited—that he may eat just as many as he has any inclination to, without having his conscience trouble him because he is extravagant.

You speak about canning them. My wife has often urged me to eat largely of *canned* strawberries, to see if they would not bring me up as well as the fresh ones do. They have never yet filled the bill very well, therefore we have not been in the habit of canning very many. Our patch of Jessie strawberries, mentioned by my cousin, D. E. Fenn, are planted just 3 feet apart, after digging our early potatoes, as I have described. They are 10 inches apart in the row. We have not kept account of the product, but I should say that they average perhaps half a pint to each plant. Next sea-

son the same plantation will doubtless give a much larger crop; but I seriously doubt whether the Jessie or the Sharpless either will give as much fruit per plant as the Crescent and Wilson, and perhaps some others. Our objection to the Crescent is the small size; but still a great many of our customers this summer decidedly prefer the small berries to the great large ones. Some of them will not have the large ones, as they say they are tasteless, etc. The Bubach is certainly a massive berry. We, like yourself, have single leaves that would cover a pint bowl, and the berries are monsters. But they are all gone after one or two pickings, while the Crescent, with its great clusters of small berries, still keeps the pickers busy. Sometimes I think there is no better berry, all things considered, than the old Wilson. Then, again, I am inclined to favor the Crescent. Finally I decide that no berry-patch is complete without half a dozen, or, better still, a dozen, of the popular kinds. The Jessie is valuable because it is so early; and the Jersey Queen, because it is so late; besides, the Jersey Queen is one of the handsomest and best berries that we have on our grounds. It is not as strong a grower as the Sharpless and Jessie, however, and it doesn't bear any thing near as many berries as the Crescent. I am astonished to hear that Talmage ever said or wrote any such folly. Our proof-reader says he thinks there must be some mistake about it. To intimate that man's inventive faculties are not a wonderful gift directly from the Almighty, seems to me, savors of infidelity. Farmers complain that wages are so high, and produce so low, that they can not keep on farming. Now, if this be true, the laboring classes have been benefited in both directions. Amen to your concluding sentence!

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

MANUM'S MODIFIED SWARMING-DEVICE.

IT will be remembered that our friend A. E. Manum clips all his queens' wings. As some of our customers want their queens clipped and others do not, we practice no clipping, leaving the purchaser to follow his own option. Our queens, unless prevented by perforated zinc, always accompany the swarm. On page 542, July 1, 1888, I mentioned a swarming-device modified from A. E. Manum's implement, which has given us most excellent satisfaction. Our device differs from friend Manum's in that we use a larger wire-cloth cage. His will hold perhaps a quart of bees, while ours will hold several. As it was late in the season we made no engraving of it then.

While Manum's arrangement is better adapted for those who clip their queens, ours is more suited for those who practice no clipping. Fig. 2 represents the wire-cloth cage or basket; Fig. 3, the device in position, receiving the bees as they cluster on the outside of the cage. Fig. 1 shows the

bees after they have clustered, and the apiarist in the act of walking off to the hive.

METHOD OF CAPTURING SWARMS.

Instead of looking for the clipped queen as soon as the swarm issues, we wait until it begins to cluster. As soon as a cluster is about half completed, we run the basket up to and around the cone of bees. An assistant, if present, gives the limb a jar, so as to disengage the bees into the basket. In case no one is ready to assist, a sliding movement will precipitate the cluster into the wire-cloth cage, when it is quickly lowered.

MANUM'S SWARMING ARRANGEMENT AS MODIFIED BY THE FOLKS AT THE HOME OF THE HONEY-BEES.

This operation, in passing down through the limbs, usually will catch the wire-cloth lid, and close it with a slam. In case it is not closed, the apiarist steps forward and does it himself. Half or two-thirds of the bees are generally confined. In all probability the queen is there also. As the bees can not get out, those still flying in the air will very readily cluster on the wire cloth, surrounding the majority of their companions inside. To make this more expeditious, the tripod is adjusted, and the cage is suspended in the air, as shown in Fig. 3, right where the bees are flying thickest. In two or three minutes the remainder of the bees will be clustered on the outside. At this stage of the proceeding the apiarist comes forward, folds the two short legs against the pole, grasps it at its center of gravity (see Fig. 1), and walks off to the hive, which he has previously prepared. The wire fork is made of steel, and is light and springy. The walking of the apiarist has no tendency then to jar the bees off from the basket.

One of the special features of the Manum arrangement is, that the basket can be adjusted to almost any position, all the way from 2 to 10 feet from the ground. All that is necessary is to spread the tripod legs, catch them into the ground, and leave them standing. In the mean time, if the hive is

not prepared, the apiarist has ample time to get it ready. After this he can return to the swarm just now clustered. Most of the devices require to be held until the cluster has settled. It is a tedious job to hold a pole at arms' length, with face upturned. If the swarm clusters very high, some other arrangement, perhaps, would be better than the Manum; but for low shrubbery it is just the thing. The other special feature of the device is, that after you have gotten about half or two-thirds of the bees into the basket, they can not escape and seek their original point of attachment.

HAULING BEES WITH COLTS—A WARNING.

During the past week I have had some experience, of a kind of which Josh Billings said, "The tushum is ruther hi." We have been moving bees with a colt, and very likely you will forecast the result before I get through. Old horsemen tell us that colts should be hitched in the stable, or to the side of a barn or high board fence, or at least something they can not get their feet through or climb over, or tangle themselves up in. My colt Billy, referred to before in this department, had been making trips to the basswood orchard nearly every day. A large portion of this apiary has been devoted to filling orders for bees and queens by the pound, nucleus, and colony. At the orchard there was neither a shed, side of a barn, nor high board fence. The only available thing was a small elm-tree, about four inches in diameter. The ground was pretty level at this spot; and although it was not the best place in the world to hitch a colt, we thought we would "risk it" until we could fit up a hitching-post, or, better, a shed after the rush of the season. Billy stamped the ground considerably around that tree, and, colt-like, champed his bits.

One day we went down after about \$75.00 worth of bees, which were to go by express in the morning. As the aforesaid elm-tree was inconveniently situated for the market-wagon, we hitched to a fence—one that was strong. We had got our bees into the shipping-cages, and were loading them on the wagon. Billy became impatient, and wanted to go home before we got fairly loaded; and before we knew it he had somehow got his foot through the fence and into a gate. With \$75.00 worth of bees in the wagon, at May prices, and the horse tangled as he was, we rather expected a fracas. A few soothing words quieted the horse so that we could untangle him, and we were soon on our way, rejoicing that we had got out of our trouble so luckily.

About a month elapsed, and Billy in the mean time was learning to stand like an old horse. One afternoon, as usual, Mr. Spafford took Billy and the light wagon, your humble servant remaining at his desk. This time Mr. S. hitched to the elm-tree, and then went about his work. He had nearly finished his last hive when he heard a little noise in the direction of the horse. Rushing out, he noticed that the animal was behaving in a very unusual manner. Well, to make a long story short, Billy had caught the right thill in the tree. He then stepped to one side, and broke one end of the shaft

diagonally off, perhaps a foot from the end. The splintered part evidently struck just back of his fore-leg, and gouted him a little. As you know, a horse, when he is pricked by any thing, never moves away from the irritating object, but, on the contrary, will push the sharp point into himself. Billy pushed the thill into himself back of his fore-leg, reeled sidewise a little, and, with the point sticking in his vitals, again broke the thill off lower down. He then fell over one end of the thill, striking the ground, and the other end plunging deeply into his heart. Before Mr. Spafford could reach him and be of very much assistance, a valuable horse was killed—one that could travel fourteen miles an hour, and one for which I had, just prior to its death, had frequent offers. Whether an unlucky bee had stung the horse, and so been the direct cause of the disaster, we shall never know. I do know that I have lost a valuable horse, and a great pet, of which my wife was exceedingly fond.

Perhaps some of the experienced horse-breeders who read this will say, "Why did you not unhitch?" For the simple reason that we had tried it once or twice, and Billy had wound himself around the tree until he did not have any strap at all. Well, this is mishap No. 2.

As our three heavy draft horses were busy, we next took Meg. As she had run away several times, Mr. Spafford, after an experience with her once, feared to take her again. No other horse being available, Neighbor H. kindly offered to loan us his Bobby pony. This likewise was a colt. The hitching-place was made more substantial, and the horse was unhitched from the thills. Every thing went well until they were well started toward home with the bees. Like a good many other colts, he did some unexpected things. Why, what do you suppose it was? He simply fell down and broke both thills. There were \$25.00 worth of bees in the buggy. Very fortunately a farmer near at hand came to the rescue immediately. Mr. Spafford held the colt down while his companion unhitched. In the mean time an angry bee had the meanness to come and sting this poor colt on the end of its nose. He lunged a little, but by good management the colt was safely disengaged from the thills, without any sliver sticking him in his side, and another serious mishap. It was then raining, and the roads were getting slippery. The thills were wrapped around with straps, the horse re hitched, and Mr. Spafford started on his venturesome journey again. When he arrived at the factory I saw that something had gone wrong again; and although Mr. S. is an experienced horseman, and a man who has broken colts, and who has handled some very vicious animals, there was a care-worn expression on his face. As I stepped up to the horse, he begged to be excused from going after bees any more, with colts. I assured him that he shouldn't.

It is said, that it never rains but it pours—misfortunes never come singly. I do know that they sometimes come singly, but I am sure, also, that they often come in

pairs. I mention this misfortune that it may be a warning to others who are under the necessity of moving bees. It was all on account of our busy season, the rush of orders, and scarcity of help, that we took these little risks. We thought when the busy season was over that we would erect a substantial shed and a suitable hatching-place. But misfortunes would not wait. The moral is, where property is involved, do not run risks, where a few dollars in a shed or in a hitching-post will save a good many dollars in an accident.

GETTING BEES STARTED TO WORK IN SECTIONS.

ALSO USING ONE OR MORE PARTLY FINISHED SECTIONS AS A STARTER.

I LIKE Doolittle's article, and the comments thereon, on page 474. For the benefit of the younger members, let me repeat what I have already said. I have never had any trouble to get bees to work in sections by simply placing in the center of the super a section upon which the bees had previously worked. It does not matter whether the honey has been emptied out or not, only so that previously it has been partly filled with honey. The severest test I ever gave to this plan was last year and the year before. In each super put on, I placed in the middle a section that had been filled or partly filled with honey, and this honey had all been emptied out. Every colony which had any honey to spare from the brood-chamber commenced promptly in this section, filled it with honey, and commenced putting honey in the adjoining sections. These colonies were very few in number. The others, which had no more honey than was needed in the brood-chamber, as well as many which had not enough for the brood-chamber, commenced work in the "bait" section, generally filling and sealing it. I had many supers with the "bait" section filled and sealed, and not another section in the super worked on. So I feel pretty safe in saying that, with such a bait section in the super, my bees will work as readily as I want them to, in the supers. The bait sections are likely to be second class, but there need be only one for each colony, not one for each super.

SHALL UNFINISHED SECTIONS BE AGAIN USED?

Since writing the above I have read friend Green's article, on page 449. I think the strongest discussion ever had on the matter of using unfinished sections was at the National Convention, at Chicago; and, if I remember correctly, it was a pretty one-sided affair. I believe I gave no opinion, unless it was to say that sections *partly* filled at the time of putting on, were sometimes watery after being filled. But I've asked myself some questions about it since, one of which was this: If bees will commence and finish a section of foundation quicker than one filled with comb, how does it come that so much more extracted honey can be produced than comb, especially by those who allow the honey to be sealed over before extracting? The Dadants, it is well known, do no extracting till the close of the harvest, leaving the combs to be sealed over; and on page 429 of that excellent book, the Revised Langstroth, they say: "If we give to bees empty combs, to store their honey, we shall find, by comparing the products of colonies who have to

build their combs, with those of colonies who always have empty combs to fill, that these last produce at least twice as much as the others." Now, if they produce twice as much in the course of the season, can they not produce it more rapidly? However that may be, there seems to be a pretty plain statement that, in the course of the season, twice as many pounds of honey will be stored in ready-built combs as in foundation. Now, if that be true of full-sized combs—although the Dadants do not use full-sized combs for extracting—why is it not true of combs of any size, even down to $4\frac{1}{4} \times 4\frac{1}{4}$? And if these sections can be sold for only two cents less than the best, they are still very profitable, if even a fourth more honey can be produced in them. I confess that I have been quite puzzled to reconcile these apparently contradictory statements and opinions. Without being at all sure of my ground, I may be allowed to give a possible explanation. Remember that many, like friend J. A. Green, have held the view that a section used by the bees last year will not be filled as soon as one containing only foundation, and that it is not profitable to use such. One year I used a number of sections partly filled, left over from the previous year. I can not now tell whether they were filled more or less promptly than the others, but they were filled and stored for some time with the others. Before very long I found these sections, which had been left over from the previous year, becoming watery, the honey oozing through the capping, while the sections built on foundation were all right. Now, in this case is it not probable that the honey left over in these sections was unripe to begin with; and, after being kept over the winter, had soured at least a trifle? And is it unreasonable to suppose that the bees would be slower in filling such sections than in filling those furnished with foundation only? I remember, that at that same convention at Chicago great stress was laid upon the importance of having all vessels, used to contain extracted honey, very clean—the least remains of granulated honey being enough to spoil a lot of fresh honey. Now, is it not possible that those who have found unfinished sections so objectionable have used those containing some old honey, at least as much as the extractor would leave in them? The sections I use for bait are treated in this way:

Those containing much honey are extracted the previous fall, and all are cleaned out thoroughly by the bees, a pile of supers being left where the bees can rob them; the entrance, however, being *large enough for only a single bee*. I could not be induced, I think, to dispense with such bait, and I wish friend Green and others would try it and report.

Let me suggest how to settle pretty conclusively whether unfinished sections or foundation will be finished first. Take such bait sections as I have described, the last vestige of honey cleaned out of them by the bees—mind you, this must be done at a time when bees will rob, or they are not likely to clean the sections thoroughly—and put one in the middle of each super. Now, don't wait till the whole super is finished, but watch from time to time and see what is the *first* section finished. Another good way is this:

Fill a super alternately with sections of comb and foundation, then keep close watch and find the time when *all* the sections of one kind are finished, but not the others, and see which kind it is. Better

not consider the outside row on each side, as local causes may affect them.

C. C. MILLER.

Marengo, Ill.

Friend M., I have observed almost every thing you mention. I know the bees start on this one section, and sometimes fill it before they commence on the foundation; but for all that, when I gave the bees a whole set of sections, built out the previous year, it did not get along as well as others that had only a section or two to start them, the rest being filled with foundation. Some of the honey might have been as nice as that built on foundation, but it certainly was not as nice on an average, and a great deal of it was watery, and some of the honey was candied, while that built on my foundation was not candied at all. This is a matter of considerable importance, and I hope we may have more testimonies like yours, from actual experience.

THAT STOVEPIPE SMOKER AND BRUSH-BROOM.

W. L. COGGSHALL EXPLAINS.

AS you desire me to explain about the brush-broom and stovepipe smoker that appear in my photograph, page 448, I will add that the smoker is made of sheet-iron, 8 inches deep, 5 inches in diameter, with a slide cover hinged on a rivet through the handle. The cover is designed to smother down the fire when burning too fast, or when not in use. There is a hole cut in the side, and strips are riveted on each side of the hole, and a slide shoves down over the hole after the fire is started. I usually leave a little draft so it will keep burning. A handle is riveted opposite the draft-hole, and is made out of half-inch and half-round iron. A half-inch hook is made on the end of a 1½-inch projecting rod at the top of the smoker, to hook over the edge of the hive. Two braces are fastened to the bottom of the smoker, to hold it away from the hive and keep it from wobbling around or burning the hive.

For fuel, I use chips or cobs; hang it on the windward side of the hive after removing the cover, and I will guarantee, if you have a good smoke going, that the bees won't bother you. You can beat the smoke down into the hive with the brush a little. It is designed for those who extract honey. I use it a great deal for taking off section cases. The brush is made from select and fine broom-corn, 9 inches wide at the brush end, so it will clean a Langstroth comb at one or two sweeps, after the bees are properly shaken off the comb. An eye-screw is put in the end, to which is attached a string, and which should be long enough to go over the head and shoulder, and hang right by your hand, and then you always know right where it is, and you do not have to look after it at all.

W. L. COGGSHALL.

West Groton, N. Y., June 5, 1889.

Very good, friend C.; but we want to know what those brooms cost. What do you sell them for at retail? how much postage do they take, and what will you take to furnish 100 for? You need not be afraid of advertising in the reading-columns. I always enjoy the fun of advertising something real good, when furnished by a good man.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, JULY 1, 1889.

Teach me to do thy will, for thou art my God; thy Spirit is good; lead me unto the land of uprightness. Ps 143:10

A LITTLE ONE GONE.

THE following card at hand will explain itself:

We have lost our darling little baby girl. She was 17 months old. She died last night. We bury her to-day.

Yours in grief,
Hamilton, Ill., June 17, 1889. C. P. DADANT.

We extend our sympathy to the Dadant family.

A NEW FRENCH BEE-BOOK.

"THE Management of the Apiary" is the title of a new work on apiculture, by Mr. Ed. Bertrand, of Nyon, Switzerland. The book has 178 pages, printed in the very best style, on calendered paper, and is sold where published at half a franc, or 10 cts. The work is a reprint of some articles which appeared in the author's *Revue Internationale* in 1882 and '83, originally written for beginners. The work is divided essentially into 12 parts, each part devoted to a particular month, and all profusely illustrated and copiously indexed. In the back part of the book we find a minute description of every individual part of the Dadant, Layens, and Burki-Jeker hives, which seem to be the three principal types in use in France and Switzerland. These descriptions are accompanied with such accurate illustrations as make the hive itself useless if we simply desire to understand its construction. The work will be found invaluable to those who can read and understand the French language.

THE ARKADELPHIA BEE-LAWSUIT.

OUR readers will remember that the bees of Mr. Z. A. Clark, of Arkadelphia, Ark., some time ago were declared a nuisance by the city council, and that Mr. Clark was warned to remove his bees, or pay a fine of not less than \$5.00 nor more than \$25.00, or go to jail. Mr. Clark, feeling that very great injustice was being done, rather than go to the expense of moving his bees, took the penalty. He finally, however, removed his bees outside of the city limits. The aid of the Bee-keepers' Union was at once solicited, and the case was tried in the circuit court, where it was decided that "the city ordinance was illegal and void;" that "keeping bees is not a nuisance." The case was carried to the supreme court, and brother Newman just announces that the Union has, after an immense amount of worry and expense, again *won* the suit, and that a *grand precedent* has been established. In no single instance has the Union been defeated; and it begins to seem now that, in view of its past victories, to enlist its aid means success every time. It would be a terribly bad thing to have bees declared a nuisance by a supreme court, and perhaps there are but few bee-keepers who realize what the decision in the case of Mr. Z. A. Clark means.

Mr. Newman, the manager of the Bee-keepers' Union, informs us that \$1000 will be needed to prosecute the cases now on hand. Remember, you can not expect assistance from the Union unless you are a member. The fees are \$1.00 per annum. Perhaps we should say here, that we are not in favor of trades-unions in general; but the Bee-keepers' Union, under its present able management we are sure has been productive of good. After we have a few more precedents established like the Arkadelphia case, outside parties will be slow to declare bees a nuisance.

A NEW SOURCE OF HONEY IN TEXAS; HONEY COMING BY THE TON, EQUAL TO ANY THING PRODUCED IN THE WORLD.

Mr. Root: I send you a sample of guajilla honey to day. I raised eight or ten tons of it this season. It weighs full 12 pounds to the gallon. Most of the honey we raise in this country is as good as this sample. I have had many intelligent men, who have been used to white-clover honey all their lives, tell me this was the prettiest and best honey they ever saw.

Your criticisms on Southern honey are generally unfavorable; but I am satisfied that, if you had enough of our catclaw honey to use one month, you would pronounce it equal to your best white-clover. D. M. EDWARDS.
Uvalde, Texas, June 24, 1889.

Friend E., we congratulate you people of Texas on having produced not only as handsome if not the handsomest honey ever gathered from any source, but some equal in flavor and every thing else that could be asked in the way of honey—not only white clover but even the celebrated California sage. By all means, tell us more about this guajilla. Is it a plant or tree, and why haven't we had some of the honey before? It seems as if this might start a new era in bee-keeping, especially if the plant or tree can be propagated. Tell us what you will take for the honey by the ton. We anxiously await further particulars.

THE A B C OF CHEESE-MAKING.

THE above is the title of a very pretty little pamphlet by J. H. Monrad, of Winnetka, Ill. The price of the work is 25 cents. It contains 36 pages of matter devoted directly to the cheese-making business, and almost every page has more or less pictures on it. It tells all about the implements used in cheese-making; tells how to make a home-made cheese-press at a very little expense, and discusses the best kinds, if you see fit to buy one. I do love to see these industrial books, and I believe I like them all the better where they are written by young farmers who have a love for the line of work they have chosen. The whole book is written in a very happy vein. Since milk and honey are so often spoken of in the pages of Holy Writ, I have often felt a good deal of interest in the cheese and dairy business. When I eat strawberries I always want plenty of milk. Of course, cream is better, especially where you have a Jersey cow; and if there is any thing that gives a relish to a nice piece of cheese, it is the very same strawberries we have been talking so much about in this issue. Now, even if you are not a cheese-maker, I think you would enjoy reading friend Monrad's A B C book. You can order it of him direct, or we can furnish it to you for 25 cts. postpaid. In the back part of this book is given a list of the dairy literature of the world. There are nine periodicals devoted to the dairy business, and about a dozen books. Two of the journals are German, one French, and six English; of twelve books devoted to dairying, six are English, two Danish, three German, and one French. I think, friends, it is good to look over the

fence occasionally, and see what our neighbors are doing.

BUSH LIMA BEANS AT THIS DATE, JUNE 29.

I CONFESS I would much rather not say any thing about the bush lima beans, or, rather, say as little as possible, in a general way; but I guess I had better own up. After investing so much money in the seeds it occurred to me that they must not only have the best ground and best planting, but they must have the very best part of the season. As the lima beans are very apt to be nipped by the frost at both ends of the season, it requires considerable judgment to decide when to plant. During the last of May, however, we were having such fine nice weather that I decided that then was just the right time to plant them. The extra early limas were put in—King of the Garden limas—and then a few of the Henderson bush limas, also a few of the Kumerle. A cold spell came on, however, and every thing stopped growing. I waited a week or more until the cold spell seemed to be over; then, as it was getting late, I put in the rest of all of them, except a few of Henderson's, because quite a few orders were coming in. You know how it has been for bee men and everybody else. We had a constant succession of cold rains. The pole limas, however, came up pretty fairly, and are doing nicely. About half of Henderson's germinated, and not one-fourth of the Kumerle. Worse still, more than half of Henderson's and the Kumerles that did start were feeble and sickly; and it is a question now whether they will ever produce any beans at all. By the middle of June, when we were pretty sure that no more of Henderson's would be called for, the rest of them were planted. As we then had pretty fair weather, and not too much cold rain, every bean came up, strong and healthy. Now, this proves, I think, that the bush lima beans, all of them, are considerably more tender and more tropical in their nature than the ordinary pole lima beans. They must have warmer weather. I think that Henderson suggests they had better not be planted until after the pole limas. I do not believe that I have a whole dozen good strong thrifty Kumerle plants growing, out of the 150 seeds that cost me over 50 cts. a seed. There may be a dozen or more sickly plants that may or may not amount to something. The Minnesota bush lima bean from Northrup, Braslin, Goodwin & Co., planted right along with the rest, came up strong and thrifty, and every bean grew. Just now they are far ahead of all the limas in rank growth; but they have no appearance in foliage of lima beans at all; and the largest part of them have already sent out strong shoots to climb poles. Present appearances seem to indicate they are simply a rank-growing, large yellow bean. There have been several complaints that the Henderson bush lima bean did not germinate freely. The above will explain the reason for it, probably. I would send you more, if I had them; but as I haven't, we will give a good big package for next season (if you will send in your name) to all those who failed with the other package this year.

OUR BERRY CROP.

WE have sold over 100 bushels of strawberries, and we shall probably have twice as many raspberries.

WE have at this date, 8821 subscribers.

SPECIAL NOTICES.

MANUM'S SWARMING DEVICE.

The swarming-device mentioned and described in the department of Recent Developments, elsewhere in this issue, we sell for 75 cts. each, or \$6.00 for ten. It weighs 9 lbs., and will hold a swarm suspended from the basket, anywhere from 2 to 10 feet from the ground.

SOUTHERN PRIZE TURNIP.

Well, friends, we now have a seven-top turnip that not only gives blossoms for the bees, and greens for early spring, but it also gives a nice turnip that will stand in the ground over winter—at least it did stand over such a winter as our last one, here in Ohio. We can furnish you the seed at the same price as our old seven top turnip; namely, 5 cts. per packet; 10 cts. per ounce, or 50 cts. per pound.

IGNOTUM TOMATO-PLANTS.

As we have several thousand of these on hand yet, we offer them, until the stock is exhausted, at the price of common varieties; namely, 10 cts. for 10; 75 cts. per 100, or \$6.00 per 1000. As the plants are quite large and strong, if wanted by mail they will be just double the above prices. If set out at once, they will give a fair crop of tomatoes in most localities, before frost. Livingston's Beauty, Mikado, and Dwarf Champion, will be furnished at just half the above prices.

POULTRY-NETTING FOR PEAVINES.

On page 510 of our last issue I stated that the poultry-netting that I used for our Alaska peas was $\frac{1}{2}$ -inch mesh. This was a mistake. I should have said 3 inches and No. 20 wire. But I made another mistake besides. Even the 3-inch mesh can not be sold for 50 cents for a bale of 150 feet. The regular price would be 67 cents, and 65 is about as low as we can figure it. When I give you any more figures on poultry-netting, I will try to submit them first to our purchasing clerk, Mr. Calvert. The 3 inch mesh is exactly as good as anything smaller. In fact, I prefer it because the mesh is large enough to reach through and pick the pea pods that are on the other side. I am not sure, in fact, but that a 4-inch mesh, if we could get it of fine enough wire, would have satisfied the peavines just as well as the 3 inch.

STRAWBERRIES.

In our issue for June 1 I told you we should probably have good strong plants ready for shipment as soon as that number was in the hands of the readers. Well, we had very nice-looking plants with great bushy tops; but the roots were so poorly developed that we have not even now filled our orders. The sooner you get strawberry-plants started, the better prospect for a crop next season. We shall plant out strawberries ourselves in July, August, September, October, November, and may be to some extent in December. But every month counts largely. The July-set plants will be away ahead of those set later, but our supply will probably be limited, although with the abundant rains they are doing an immense business in the way of making new plants. There is one of the new things in gardening, however, that we can furnish you in any quantity, and they are ready to ship now. It is the Egyptian, or winter onion. These this season have fully sustained their reputation. We have now had them three winters in the same spot of ground. We never knew an onion to be winter-killed, and they are such strong growers that they crowd out weeds and every thing else. Just get them started on some good ground, and you will always have early onions, almost with no attention whatever. Like the strawberries, the sooner you get them in the ground, the better. Wherever early peas or early beets, or any thing of the kind, comes off, just drop the seeds in a drill as you would peas, and in a very few days you will be delighted to note their wonderful growth. They not only bear sets on the tops, but they bear them out on the sides, and seem to do every thing that an onion can do to multiply and replenish the earth with onions. Price 10 cts. a pint; \$1.25 a peck, or \$4.00 a bushel. If wanted by mail, add 8 cts. per quart for postage.

AN ATTRACTION FOR FAIR-EXHIBITS.

Some of our old customers will remember that we used to advertise and furnish sections $4\frac{1}{4}$ in. square, with fancy-shaped center, such as stars, hearts, diamonds, etc. We have not made these of late, but we have had frequent calls for letters to be filled with comb honey by the bees, to form mottoes. We have never been well equipped for making these till now. We have a full set of pattern letters to work from, and they are of such a size that three will fill an 8-section wide frame, the openings forming the letters being about $7\frac{1}{2}$ in. high and 5 in. wide. M and W, of course, are wider, and I narrower. The letters are of the following pattern:

FAIR, 1889.

The price will be 10 cts. per letter or figure. With thin foundation inserted, 15 cts. per letter or figure. In ordering, if you will write the letters in the order you want them, we can make 3 letters in one piece, just right to slip into a wide frame. Or if you don't happen to have a wide frame, simply tack a bar on top, to suspend it from, and hang it in the hive without a frame around it. The 4 figures, 1889, will go in a frame. To make the letters, we simply tack two $\frac{3}{4}$ -inch boards together, mark the letter, and jig it out on a scroll-saw. To put in the foundation, separate the boards, lay a sheet between, and tack them together again. We make the letters large, because the bees will work in them more readily, and they are much more conspicuous when filled.

PREMIUM OFFER.

To those intending to make an exhibit, and who will agree to distribute judiciously the circulars we will send, we will furnish free one letter or figure for each dollar's worth of goods ordered, if the order amounts to \$4.00 or more. If foundation is inserted in each letter, we will furnish 2 letters for every \$3.00 worth of goods ordered.

JAPANESE * BUCKWHEAT.

500 BUSHELS SOLD ALREADY.

Now is just the time to sow it. We once harvested a crop of gray buckwheat seed that was sown Aug. 10. We do not advise such late seeding, as the frost is apt to catch it before it is ripe. From the 1st to the 20th of July is the best time to sow. We have plenty of seed yet, \$2.00 per bushel; \$1.25 per $\frac{1}{2}$ bushel; 75 cts. per peck; 10 cts. per lb.

A. I. ROOT, Medina, Ohio.

BUSHEL POTATO-BOXES.

GALVANIZED & BOUND.

(TERRY'S).

These are made of basswood, bound with galvanized iron. The galvanized iron gives strength, and the basswood strength and lightness. These hold exactly a bushel when level full, and may be piled one on top of another. Although they are made especially for potatoes, they can be used for fruit, vegetables, picking up stones on the farm, and a thousand other purposes. When piled one above the other, they protect the contents from the sun and rain; and from their shape a great many more bushels can be set into a wagon than where baskets are used. They are also much more substantial than baskets.

Price, nailed up, 25 c each; 10, \$2.25; 100, \$20.00. In the flat, including nails and galvanized iron, \$1.75 for 10; 100, \$16.50; 1000, \$150.

SLATTED POTATO-BOX

As the pieces of which the above are made are mostly from remnants of basswood used in making sections, we can furnish them nailed up for 20 cents each; 10 for \$1.85; 100, \$16.00. Material in the flat, including nails, in packages of 12 boxes each, at

\$1.50 per package, and each package includes two of the twelve boxes nailed up, complete. Ten packages, 5 % off.

We have over 100 packages of the latter in stock ready to ship by return train. Please be careful in ordering to say whether you want the *galvanized bound* or the *slatted* boxes.

A. I. ROOT, Medina, Ohio.

FOX-HOUND PUPPIES FOR SALE.—First-class stock. Address C. A. WOOD, 13tfdb Tarrytown, Westchester Co., N. Y.

KIND WORDS FROM OUR CUSTOMERS.

I received the extractor June 12, in good condition, and am much pleased with it. J. M. SMITH. Perkiomenville, Pa., June 18, 1889.

The plants are received. I never saw such a nice way to pack them for shipping. We set them out, and it being wet they not even wilted. They were much larger than I expected to see, and good count; came quick, as I got them Thursday night, and sent Monday. R. GOLLING. Chase, Lake Co., Mich., June 1, 1889.

The tomato-plants you sent me came all right. It was a surprise for me to see that plants can be sent by mail so safe. They are as nice as if just taken out of the seed-bed. Just think of it! They were five inches larger than I thought they would be. Thanks for the nice packing. H. WILLING. Chesaning, Mich.

SWEET POTATO PLANTS AND THE DOVETAILED HIVE.

Those sweet-potato plants came through in the best shape of any I ever received from any grower—all alive, growing finely.

My Dovetailed hives came yesterday. I got them home last night. I could not go to bed till I had one all complete. I am well pleased with them. I think they are stronger than any other hive I ever saw, and I like them nearly as well as my own make, and perhaps I shall like them better after using them one summer. F. L. SNYDER.

Orion, Wis., June 13, 1889.

IF YOU WANT BEES

That will just "roll" in the honey, try **Moore's Strain of Italians**, the result of ten years' careful breeding. Reduced prices: Warranted queens, each, 70c; 3 for \$2.00. Strong 3 L. frame nucleus, with warranted queen, \$2.50. Safe arrival and satisfaction guaranteed. Those who have never dealt with me, I refer to A. I. Root, who has purchased of me, during past nine years, 45 queens.

Address **J. P. MOORE,** 13d Morgan, Pendleton Co., Ky.

JAS. F. WOOD, NORTH PRESCOTT, MASS.,

Will now ship by return mail, his warranted queens to any address, for 75 cts. each, or \$8.00 per dozen. Single queen to Canada, 85 cts. Being isolated from all black bees I am able to warrant every queen purely mated, and safe arrival guaranteed. Every queen is of good shape, and all have filled several combs with eggs before being shipped. I will replace every queen that hatches a black bee with a select tested queen, worth \$2.00.

If you want the best queens promptly, send me your orders. I am bound to suit you. Address as above. 13tfdb

FOR CASH.—Italian queens in July and August. One, untested, 60 cts.; per doz., \$6. One tested queen, \$1.25; per doz., \$12. Guarantee safe arrival. Address **D. E. ALDERMAN,** 13d Clinton, Sampson Co., North Carolina.

MY 21ST ANNUAL CATALOGUE OF ITALIAN, CYPRIAN, and HOLY-LAND BEES, QUEENS, NUCLEI, COLONIES, and SUPPLIES; also EGGS FOR HATCHING, can be had by sending me your address. **H. H. BROWN, Light Street, Col. Co., Pa.**

300 Tested and Untested Italian Queens From Imp. Mothers, by Return Mail.

Tested, 75c. Untested at \$6 per doz.; 50c each. No foul brood ever known here. Queens light.

Money-order office, New Iberia, La. 13-24db **J. W. K. SHAW & CO.**

TESTED Italian queens, \$1 each; untested, 75 cts., or three for \$2, by return mail. 13tfdb **I. R. GOOD, Nappanee, Elkhart Co., Ind.**

WANTED! At Plattsmouth, Nebraska, to Sell **3-Frame Nucleus Colonies Italian Bees with Queens, at \$2.50 Each.**

9tfdb J. M. YOUNG, Box 874, Plattsmouth, Neb.

MUTH'S HONEY-EXTRACTOR, SQUARE GLASS HONEY-JARS, TIN BUCKETS, BEE-HIVES, HONEY-SECTIONS, &c., &c. PERFECTION COLD-BLAST SMOKERS.

Apply to **CHAS. F. MUTH & SON,** CINCINNATI, O. P. S.—Send 10-cent stamp for "Practical Hints to Bee-Keepers." (Mention *Gleanings*.) 1tfdb

THE REVISED LANGSTROTH, and DADANT'S FOUNDATION. See advertisement in another column.

LITHOGRAPH LABELS

In 12 Colors, at \$2.00 per 1000.

The 12 colors are all on each label. They are oblong in shape, measuring $2\frac{1}{4} \times 2\frac{1}{2}$. They are about the nicest labels we ever saw for glass tumblers, pails, and small packages of honey. We will mail a sample, inclosed in our label catalogue, free on application, and will furnish them postpaid at the following prices: 5 cts. for 10; 35 cts. for 100; \$1.20 for 500; \$2.00 for 1000. **A. I. Root, Medina, O.**

A STEP FORWARD TOWARDS SUCCESS!

After carefully studying the demand of consumers and dealers, and selecting of the many styles of packages for comb honey the very best and the most attractive, we have now prepared an improved paper carton combined with a comb-protector. Honey, put up in these packages, will be bought in preference to all others at highest market price. Our patent comb-protector will prevent leakage and soiling of sections. Comb honey can be easily and quickly put up in our cartons. These advantages and the small cost of our cartons and comb-protector will save labor, time, money, and honey. Strohmeyer's patent comb-protectors require $\frac{1}{8}$ inch of the inside height of crates. Price list and sample carton sent free on application.

F. G. STROHMEYER & CO.,
Wholesale Honey Merchants,
122 Water Street, New York.

Bees and Poultry

The Canadian Bee Journal and Poultry Weekly is the best paper extant devoted to these specialties. 24 pages, WEEKLY, at \$1.00 per year. Live, practical, interesting. Nothing stale in its columns. HONEY COLUMN.

CITY MARKETS.

BOSTON.—Honey.—We are entirely out of comb honey; not a case in the store—something that has not happened for a long time. We are expecting new every day. Price will be about 18 cts. We have received some new extracted white clover from Vermont, selling at 8 to 9 cts.

July 10. **BLAKE & RIPLEY,**
Boston, Mass.

NEW YORK.—Honey.—Extracted is scarce. We quote orange bloom and palmetto at 7@7½. California, new light amber, 7@7½. Southern, inferior grades, 65@70. California, comb honey, new, 1-lb. sections, in eastern style, 12@14.

July 10. **F. H. STROHMEYER & Co.,**
New York.

CHICAGO.—Honey.—Some of the new crop has come to market, and has sold from 15@17; the higher price being paid for a good straight lot of scant one-pound sections, all combs being straight, color and flavor that of white clover. The market will not be active until later in the summer. New extracted, 7@8. *Bee-wax*, 25. **R. A. BURNETT,**
July 11. 161 So. Water St., Chicago, Ill.

CINCINNATI.—Honey.—Arrivals are fair of new extracted and comb honey. Demand is slow. We quote 5@8 on arrival as the range of extracted honey, and 12@15 for fair to choice comb honey in the jobbing way. *Bee-wax*. There is a good demand at 20@22 on arrival for good to choice yellow.

July 13. **CHAS. F. MUTH,**
Cincinnati, Ohio.

KANSAS CITY.—Honey. New comb honey, firm, this State coming in quite freely; selling slowly at 16@18 for 1-lb. sections. No new extracted in market. *Bee-wax*, none. **CLEMONS, CLOON & Co.,**
July 10. Kansas City, Mo.

ST. LOUIS.—Honey.—Market quiet, with sales ranging from 6¼@6½ in barrels for light, good flavor. Dark, 5@5½. *Bee-wax*, prime, scarce at 25.

July 10. **D. G. TUTT GRO. CO.,**
St. Louis, Mo.

DETROIT.—Honey.—The market is lifeless. What little honey there is left is poor. No new honey in. Comb honey, 12@15. *Bee-wax*, 25. **M. H. HUNT,**
Bell Branch, Mich., July 10.

COLUMBUS.—Honey.—Honey is coming in very slow. Too much swarming in this section. Some good white honey would find ready sale in our market at 15@16 in 4¼x4¼ sections.

July 11. **EARLE CLICKENGER,**
Columbus, Ohio.

FOR SALE.—Extra choice clover honey in boxes of two 60-lb. tin cans each per box (120 lbs. net), \$10.00. **OLIVER FOSTER, Mr. Vernon, Linn Co., Ia.**
14tfdb

FOR SALE.—New extracted honey, white clover and linn. In tin cans. Write for sample and prices. **J. B. MURRAY, Ada, Ohio.**

FOR SALE.—1000 lbs. new first-class white-clover extracted honey, at 7 cts. per lb., in lots of 100 or more lbs., delivered on board of cars free; purchaser furnishing packages, or paying undersigned for same at A. I. Root's prices.

OUT-APIARIES NO. XI.

SHUTTING UP BEES, AND HAULING.

IF it is necessary to fasten frames in the hive, it may be done any day previous to the hauling. I prefer to do it when bees are flying. All the other fastening may be done any time beforehand, except the shutting-up of the entrance. That should not be done sooner than the evening before the hauling, after the bees have stopped flying for the day. If you are up early enough, you can fasten them up in the morning of the day when you haul them. If it is tolerably cool, or if your bees are very quiet, and you are very careful, you may be able to shut them in without using any means to quiet them. Move softly, for once aroused it will take some time for them to settle down. A little smoke will drive them back so you can imprison them. *Very little* is enough, for I suspect that the application of smoke, when bees can not fly immediately afterward, does them no good, to say the least. Lately I use water instead of smoke. I don't think the water does any harm, and I suspect they are often the better for it. Take a pail of water, and, with a dipper, dash about a pint into the entrance, not all at one dash, but so it shall be wet in all parts. That seems to leave the entrance clear of bees, and on the whole I like it better than smoke.

If you expect to haul more than one load in a day they must all be shut up before they start to fly in the morning. If water be used at the final shutting-up, I think it is just as well for the bees to be shut up at night as in the morning. They don't find out they are fastened in through the night, and so don't worry. You may fasten them up in the evening, and haul them the same evening. If the weather is cool they will stop flying quite early in the afternoon, giving you time to make most of the

journey before dark. Before putting a hive on the wagon, give it a searching examination to make sure there is no crack anywhere that a bee can get through. You will do well to use no very old hives for hauling; still, you may be obliged to use them, and special pains must be taken to see that there is no danger of bees getting out on the way. Plug up carefully with old soft rags any spot that you think is about half big enough for a bee to crawl through. Let me suggest, if I have not done so before, that you must be very careful not to have bees get out on the way. Look all over the top of the hive; examine closely the front, the back, each side; tilt the hive on end, and scrutinize the bottom. Don't be fool enough to hitch your horse in the wagon before your load is on. Let every thing be in readiness to start the minute the horse is hitched on. Have hammer and nails along, ready for emergency. Take a lighted smoker with you, and be ready to have every third man you meet tell you your load is on fire. After you have had experience enough, it is possible you may not keep the smoker burning, but don't try it too soon.

When I use two teams at a time, both wagons are loaded before either team is hitched on, then both teams are attached. I mount one wagon, my assistant the other, and off we go, keeping within hailing distance of each other. If bees are flying when we start, it may be necessary to haul the wagon a little distance by hand before hitching on, so that the bees may not annoy the horses. For some time after starting, if the bees are flying it makes me very nervous to have loose bees flying along, following the wagon, for I am never sure that none of them are getting out of the hives on the wagon. I heave a sigh of relief when the last one disappears. During my first experience in hauling, one day I was going along very quietly, when all at once a number of bees were flying

about the wagon. Before I had time to examine the hives thoroughly it occurred to me that we were passing by a large maple-tree in full bloom, and the smell or the noise of the bees in the hives attracted the attention of the bees that came to the tree. The same thing has occurred many times since, also in passing other hives near the roadside.

In hauling bees after night, there is, I think, no danger of horses being stung; but if there should happen to be a leak in a hive anywhere near where you are sitting, it is not pleasant to have the bees crawling over you, and possibly stinging you, for you can't very well do any thing but drive straight along, unless you prefer to get off and walk. If your road is smooth you can jog along on a trot. Have your horse hitched up tight; that is, so that when he is standing still he can not move a step backward or forward without the wagon going with him. Then if you come to a bridge which is bad at the jumping-off end you can stop your horse and ease down the wagon off the bridge. It is hardly necessary for me to say, that all hives should be loaded on so the frames shall be *across* the wagon, not lengthwise. C. C. MILLER.

Marengo, Ill.

Every thing you say, friend M., reminds me vividly of my trials when I used to draw bees on the one-horse wagon; and I assent to every point you make, with the exception of the closing one. I would assuredly have the frames run *lengthwise* of the wagon; for if they didn't, when you undertake to ease the wagon down from that bridge you mention you would bump the heavy combs out of the frames. Haven't you made a mistake?

AMONG THE BEE-KEEPERS OF VERMONT.

MR. MANUM AT HOME.

EARLY one morning last August the writer boarded the White Mountain express and left Little Rhody, with her extensive and diversified manufactories, with the purpose of gratifying a long-cherished desire to visit the principal Vermont honey-producers. We were hurried up the valley of the Blackstone, past the numerous factory towns and hamlets into Worcester, then away toward the northern hills, across Massachusetts, through the level country between Gardiner, Winchendon, and Keene, from which grand old Monadnock towers up alone out of the apparent level, with its peaked summit piercing the clouds.

As we crossed one corner of New Hampshire and neared Bellows Falls, the scenery was more mountainous, and the road ran along the hillside above fertile-looking valleys, and soon the noble Connecticut River came to view, its waters flowing peacefully through the wide valley after its rush and leap at Bellows Falls. At the Falls this great volume of water rushes through the crooks and turns of a narrow channel worn in the rock, and, whirling and boiling, tumbles over the ledge into the wide bed below. Owing to there being less water than usual, its roar was not as deafening as at the time of former visits. Here log-drivers are a familiar sight, and in the season do some of their most dangerous work.

Near the Falls is the junction of several railroads,

and at the depot restaurant we took the usual hurried lunch. The extensive works of the Vermont Farm Machine Co. are located here in the town, as well as prosperous paper-mills. At the freight depot men were weighing loads of wood pulp, thick sheets right from the mill, and still wet.

At Bellows Falls we parted with the White Mountain travelers, whose route followed the Connecticut up through White River junction, while ours was through Rutland toward Burlington. Along the route the hills were higher, and the road ran first on one side of the valley then on the other, while the blue outlines of the Green Mountains were to be seen on the east. The road ascends all the way to Rutland, and we were conscious of a different air and altitude. Before reaching there we occasionally noticed small apiaries, and at East Wallingford we had a passing view of an apiary of about 50 colonies below the railroad. Their keeper was evidently standing over an open hive, while hive-cover and sections were lying near. Rutland was reached about 2 o'clock, but we soon left this fine town and important railroad center, and soon were speeding away through the towns bordering on Lake Champlain. Off at the west, beyond the lake, which was hidden, the dim blue outlines of the Adirondack peaks were plainly visible, while at the right the Green Mountain range towered up abruptly, and reached as far as could be seen north and south.

After passing the marble-quarries for which Rutland is celebrated, and when near the station of Proctor, we saw another apiary of 40 colonies or more, and learned that in the vicinity were two others of 50 or 60 colonies, and at Brandon a yard of 100 colonies.

We passed through the beautiful town of Middlebury, the home of Mr. J. E. Crane, a leading bee-master of the State, but I did not stop, leaving that for our return trip. In the woods along the river we noticed that large white-poplar trees were numerous, and realized that we were near the home of the white-poplar section and shipping-crate.

At New Haven we took a stage to Bristol, $5\frac{1}{2}$ miles away to the east, and at the foot of the Green Mountains. Here is the home of Mr. Manum, which, in response to a cordial invitation, we had chosen as our first destination. Not knowing the day we were coming, he was at an out-apiary which he had commenced to move to a new location. We were cordially welcomed by his wife, whom we found to be a genial hostess, and not only interested in but well posted on the affairs of the apiary.

The time passed quickly, and before dark Mr. Manum and assistant drove up, each with a load of outer cases compactly piled and securely tied together with numerous ropes.

We soon had the pleasure of conversing with one whose extensive bee-operations prepared us to appreciate the privilege. We found him very genial, a free talker, ready to give any information he possessed, also ready to see the value of and quick to adopt any good thing advanced by others. He says he has no secrets to withhold, and considers it a duty to make public any information he possesses, and has written many long letters explaining his methods to many in various parts of the country, free of charge, but admitted this was too much of a tax on time and strength. We can testify that he has done this for us in the past, for which we are very grateful.

He is a medium-sized man, dark complexion, with no spare flesh, but very active and energetic. His eyes are small and black, and light up pleasantly in conversation.

We had a bee-convention by ourselves; and when I recall the number of nights which we sat and talked until midnight, and think of his family, I still have twinges of conscience. Mr. Manum's house is on the main street, near the mountains, which here tower up abruptly to a great height, and are covered with foliage to their very tops—*green* mountains indeed. Back of the house is the work-shop, and honey-house and stables, which we inspected the next morning. Here are the headquarters from which loads of supplies prepared in winter are sent to the out-yards, and where the honey is cleaned, graded, and stored. The sections are cleaned by women and girls, and separated into four grades. Those combs, the most perfect and white, are marked "Snowflake;" those full and white, "Green Mountain;" fair and good weight, "Comb Honey;" and the fourth, "Light Weight." Wooden sides are used entirely instead of glass, and are fastened on with strips of paper. Crates take 20 sections,

The top-bars of his frames hang on strap-iron rests, or rabbets, and do not touch the hive at the ends by a quarter of an inch; this prevents their being glued down. To keep them from swinging when moved, a quarter-inch strip, as wide as the rabbet is deep, with small blocks nailed on at the right distance apart, is crowded down into the rabbet at each end, and another is tacked across the bottom, which keeps all as snug and firm as closed-end frames. He has two rigs for carting bees; the single team takes 23, and the double team 50 hives. One tier is set on the wagon-bottom, then a rack put in that stands three or four inches above them, on which is placed another tier containing two additional hives. The thumb-screws are then turned up to bring the wagon-body firmly together.

After a pleasant ride of 5 miles along the mountain stream with its varied scenery, and during which time we gained much information from our companion, he turned into a farm-yard and drove up the hill, where were more rows of hives with a honey-house near by. Here the bees had not done as well as elsewhere, and were to be taken to a better location in the valley north of Bristol. Soon all hands were lifting frames of bees out of hives and

MR. MANUM AND HIS HOME APIARY.

Back of the honey-house, beneath the branches of a small orchard, was the "Home" apiary. Nearly all colonies were in chaff hives, numbered and arranged in long rows; there were also many nucleus hives containing surplus queens, and near by a long row of the Chapman honey-plant, most of it out of bloom, but a few balls were in flower.

We had urged him to continue the moving, and allow us to accompany him; so after looking through the home yard we started for the Lincoln apiary, to bring back a load of bees. Another team had preceded us to get a load of outer cases. One wagon was filled with empty hives, made with permanent bottom for shipping. The bottom and sides were of light boards and a sheet of muslin; one edge permanently attached served for a cover. In the ends of boxes were auger-holes covered with wire cloth.

putting them into shipping-boxes; queens were generally found, and covers marked accordingly. Strong colonies were divided into two parts, for fear of smothering. Bees were cross, and smoke was hardly protection enough. They were bothered some; but as we always have our veil handy, we were all right, and felt more than ever satisfied that we did not care to entirely dispense with a veil.

The muslin cover was tacked down all around, and the wagon loaded. The cleats on two sides of each hive kept them from rubbing each other or the wagon-body, and saved the covers from wearing through. The horses had been taken out of the shafts, and tied at a distance. When loads were ready, one mounted the wagon, the other two hitched in the horse, threw up the reins, and they were off at once. We reached Bristol all right, but

it was evident that the bees were needing more air; so instead of leaving them on the load they were taken off and allowed to fly. Rims were then made and covered with wire cloth, and used in place of muslin to finish the trip, and with the remainder. He usually makes new apiaries in the spring when bees are few, or when it is cooler in the fall, then the muslin works all right.

Three horses are used during the season, and occasionally extra ones hired.

There are seven out-yards, $2\frac{1}{2}$ to 16 miles from the home apiary, and through the swarming and honey season a man is kept in each. There are about 700 colonies in all, and he intends to leave 125 in a yard every fall. This number insures, after making nucleus colonies, at least 100 good strong working stocks ready for the honey-flow.

Pawtucket, R. I.

SAMUEL CUSHMAN.

To be continued.

MANUM IN THE APIARY WITH HIS MEN.

HOW TO SAVE LABOR AND TIME IN MANIPULATING HIVES.

JULY 18.—“What are you looking after, Will?”

“I am trying to find this queen. She is two years old, and I want to supersede her with a young one, as you told me the other day to remove all two and three year old queens and introduce young ones in their place. I have now a number of fine ones just commencing to lay, and more queen-cells coming on to take the place of the young queens in the nuclei. I have looked through the hive twice, but I can't find this old queen, there are so many bees in the way.”

“Well, just close the hive, and allow them to quiet down for a few moments, and then we will try to find her. Never keep a hive open too long; it is better, after looking a while, to close the hive for an hour, and then try again.”

“While we are waiting, Mr. Manum, I wish you would look at No. 10. I have tried three or four times to introduce a queen in that hive, and have failed each time. They ball her as soon as liberated, and I don't wish to lose any more queens by that colony.”

“How long have they been queenless? Can you tell?”

“By the record, 17 days; and I have kept the queen-cells cut out, as I wished to give them a laying queen; but I have failed in that, and they have nothing now but sealed brood.”

“We sometimes have such obstinate colonies, and it is not many years since I hit upon a plan to make them accept a queen. Have you any virgin queens?”

“Yes, several.”

HOW TO MAKE AN OBSTINATE COLONY ACCEPT A VIRGIN QUEEN.

“Very well; you may cage one and bring her here. There, I will now shake all of these bees on to the ground, in front of the hive, say two feet from the entrance—there, so. Now, this last comb I will shake near the hive, so that the bees that are on it will attract the others to the hive. Now, when they get well to running into the hive, just let the virgin queen run in with them, and the job is done. I have found that a colony in this condition will accept a virgin queen when they will not one that

is fertile. Another way I have succeeded in making such a colony accept a queen is to take out three of their combs and give them a good nucleus having a laying queen, by setting the combs, bees, and queen, from the nucleus at one end of the hive, where I take out the three combs. This should be done very carefully, not to excite the bees either from the nucleus or those in the hive. It is a good plan, when uniting in this way, to drop a few drops of essence of peppermint on the bottom of the hive.”

HOW TO FIND A QUEEN IN A POPULOUS COLONY, WITHOUT LIFTING OUT ALL THE COMBS.

“We will now return to hive No. 10, where you failed to find the queen, and I will try to find her for you. Now watch and see how I look for queens when that is all I am after. There, I first remove the comb nearest to me and set it against the hive near the entrance, after first looking it over for the queen. Now I cast my eye over the side nearest to me, of the next comb, and carefully move it toward me to the side of the hive in the place of the first comb. I raise it barely enough to move it; at the same time, I look for the queen on the side of the third comb which is in sight, by the removal of the second comb, and at once look on the opposite side from me of the second comb, and then raise the third comb and set that in place of the second, and quickly look at the side of the fourth, and so on through the hive until she is seen on one of the combs, when it is quickly raised, and the queen removed. I can find queens in this way much quicker than by lifting the combs out of the hive; but if I do not find her when going through the hive in this way, when returning I lift out each comb and look it over carefully until she is found, or the combs all looked over and placed back where they belong, when, if she is not then found, I close the hive for a short time, as I told you to do with this one. There she is on the fifth comb. Now look at her before I lift out the comb, and see how plainly they can be seen in this way.

“Here is another thing I want you to observe; that is, that *queens have red legs*; that is, the lower half of their legs is a dark brownish red, while drones and workers all have black legs. This fact will sometimes help you to find a queen where the bees are very thick, and cluster over her; so then, when you see a bee with red legs you may know it is a queen.

“She is a nice queen, and it seems too bad to discard such a fine one as she is; but she must go. I would rather have young ones to carry a swarm through the spring. Now, just at night you may give them another queen.”

A. E. MANUM.

Bristol, Vt.

Very good, friend M. I have practiced exactly the plan you speak of for finding queens, although it never occurred to me to put it in print; and I have used that same plan when some one else had tried and failed before. I have never noticed that the legs of a queen were of a different color from those of the other bees, but I have discovered that I can detect a queen a great many times by getting a glimpse of her legs, especially when she is under a clump of bees, when I could not otherwise. And since you speak of it, I think there is a shade of difference in color. Sometimes I got just a glimpse of her long striding legs, and then

they would be lost; but I felt so certain that the legs belonged to a queen, and nothing else, that I kept my eyes on the same spot, or nearly there, and eventually I would find her. I am much obliged to you for reminding me of this matter. Now, I believe that, if the queen I was hunting for to replace should prove to be a fine large one I would let her alone. Very likely, however, it would be a mistake. I can not quite see why any colony should receive a virgin queen when they would not receive a laying one—that is, unless they have already a queen of some sort. In that case they might neglect to notice the virgin queen, where there would very soon be a hubbub were we to put in a laying queen. I believe I have always succeeded in getting any colony to accept a queen by simply taking all their combs away, and leaving them clustered on the side of the hive, without any combs at all, say for from ten to twelve hours.

IMPORTED QUEENS AS HONEY QUEENS.

HOW TO MAKE SELECTED HONEY QUEENS DUPLICATE THEIR QUALITIES IN OTHER QUEENS.

OCCASIONALLY there is found one of those queens (see p. 508, June 15) that will produce workers better than the average, and there are two very strong chances to run in breeding from these abnormal freaks of nature. The chances are, the strong tendency of perpetuation of either an establishment of the peculiarity or of the direct reverse. These peculiarities are occasionally found in every thing, and the best way is to test the reproductive tendency, and by in-breeding establish it. I knew of such a case happening among half a dozen imported queens obtained from the Home of the Honey-bees in 1882. The queen was dark, small, and inferior-looking. Her workers were dark leather color, very large and long in the abdomen, and heavy-winged. They were gentle in the extreme, and rather lazy in their actions. But they just lugged in the honey. Now, the law, as a rule, is to show characteristics mostly in the alternate generations; and to dispose of that alternation, this plan was resorted to, that proved true: Queens were raised in abundance from her, and a whole apiary of 30 colonies were queened with them; drone-combs were inserted in the hives of those queens mostly resembling their mother's workers in general characteristics. The queens that raised the most even drones were then given an abundance of drone-comb, and it was excluded from the other hives, and the drones all trapped off that were in the apiary. More queens were raised late in the fall, and were mated with these drones, because there were no others permitted to come out of the cells. In 1883 these queens showed the characteristics in their workers that were in those of the old queen; and from these young queens another set were raised to be used as drone-breeders, to raise drones for mating with the old queen's daughters which showed the result, and the daughters from other strains were brought to the mating apiary to further test the results, which proved to be continually becoming more established; and I know where there are hives to-day that have queens containing a tincture of that blood which was sur-

prisingly apparent during the two very poor seasons of 1887 and '8. Neighbor H. had better stock one apiary with queens for drone-raisers from that best queen, and use her for a second-generation breeder.

H. L. JEFFREY.

New Milford, Ct., June 29.

FALSE STATEMENTS IN REGARD TO THE HONEY BUSINESS OF OUR COUNTRY.

As a protection to our bee-keeping population, we propose in this department to publish the names of newspapers that persist in publishing false statements in regard to the purity of honey which we as bee-keepers put on the market.

MORE WONDERFUL STILL.

I THINK I have before mentioned that we send GLEANINGS to the pastor of our church. Although we are so unfortunate as to change pastors quite often, somehow it does not seem to take very long for a minister and me to get acquainted, and to become very intimate friends. As a matter of course, he takes GLEANINGS. I think I have mentioned that our last pastor was called back to China. Our new one is quite a young man; but for all that, when he read that passage in our last journal, asking all the bee-friends to go right to work and look over cyclopedias, he pulled his down from the shelf, and what do you think he found? Well, right here it is below:

Dear Brother Root:—In accordance with your suggestion in GLEANINGS for July 1, I consulted the *American Cyclopaedia* on the subject of artificial honey. In the body of the work, under the article "Glucose," we are referred to the Supplement; namely, the *Annual Cyclopaedia*. In the Annual for 1881 (Vol. VI. of the New Series), under article "Glucose," p. 351, column D, line 25, I find this statement: "Glucose is very extensively fed to bees, which eat it with great avidity, and store it away unchanged as honey. It is also put up directly in trade, as honey—with which bees have had nothing to do—being put up by means of appropriate machinery into artificial combs made of paraffine." As Messrs. D. Appleton & Co., publishers of the above, issue a supplement every year, I hope you can secure a retraction in the issue of 1889.

Medina, Ohio, July 3, 1889. NORMAN PLASS.

Now, the astonishing part is, the statement above has been *eight* years before the American people—in fact, in the *American Cyclopaedia*; and yet with all our zeal to hunt up newspaper editors and take them to task, not one of us has in all these years found the above scandalous and ridiculous statement. I presume the publishers of cyclopedias pay the men who write up a special subject for them a good price for so doing, and these men are supposed to obtain their facts from actual practice. Suppose a man should be employed to write up the subject of brick-making for a cyclopaedia; and instead of going to a brick-yard and spending several days and weeks in watching the workmen, and talking with the proprietor, he should simply hunt over newspapers and talk gossip with people who had never been in a brick-yard in their lives. Well, it is just what they have been doing on the subject of bee culture. A man was

procured to write up the subject of glucose. Instead of going to a glucose-factory, or consulting a manufacturer, or even a workman, he goes and gives for a cyclopedia the above absurd piece of newspaper gossip and scandal. If this is the way they do things, the makers of cyclopedias, the publishers and agents should be told, when they come around with their books, "No, thank you. When we can find a cyclopedia that gives us facts obtained from real practical work, we are ready to invest; but no book shall find a place in our families for our children to read, that retails falsehood and scandal like the glucose story."

BEEES FOR BEAUTY OR BEEES FOR BUSINESS—WHICH?

SOME VERY PERTINENT SUGGESTIONS.

IN the selection of queens for breeding purposes, should there not be less stress put on those producing workers having three or more yellow bands, that we have been told so often are the distinctive markings of *pure* Italians, and more be said about pure Italians that have that peculiar vim that indicates business in the hive and field? There has of late been much said about such very bright workers and red-headed drones, that many might be led to believe that only bees possessing those characteristics would be of any benefit to any one contemplating the keeping of bees. The question seems to be whether to breed for beauty and gentleness, or for utility and as much gentleness as we can. As the result of several years of breeding for beauty and gentleness, we find that, in nearly all cases, where we have a colony that are beauties and need no smoke when we manipulate, that these same bees are far behind some of their less showy and darker neighbors. Of course, there are exceptions, and we find that occasionally there will be bees combining all three requisites; viz., color, gentleness, and excellent honey-gatherers; but when we breed from queens producing such bees, they almost universally fail to reproduce all those requisites; therefore we have come to the conclusion that, from a financial standpoint, it is very nearly impracticable to breed such ideal bees; while, on the other hand, we can quite easily breed a strain of pure Italians that do not have any distinctive marking, yet they are hardy and great workers, and it would do a man's heart good to see them dropping away in front of their hives and finishing the rest of their journey on foot; and when we look into their hive they make one say, "By their works ye shall know them."

Risking the treading on some queen-breeder's toes, we will say, that, generally, these beautiful golden yellow bees are the "dudes" in beedom. Some of our largest honey-producers repudiate these same light-colored bees, and some have decided that a cross between dark Italians and the brown bees produces a strain possessing more good points than any race in their purity; but we have a very strong opinion that a strain of dark leather-colored Italians can successfully compete with any bee on earth, and in all points. If we are wrong, we have the consolation of knowing that we are not alone, and that hundreds stand ready to be convinced of their error, if error it is. Who is there that is trying to make his bread and butter by

the production of honey, that cares whether his bees show beauty or not? Stings are to be expected; and if a colony of bees have stamina enough to fill their hive and supers with honey, they will try to protect it. Judgment must be used in handling bees, as *all* times is not always the *right* time; and this fact should be borne in mind when people wish to peep into their hives, or take off honey; if they will, there will not be so many wishing for bees showing a more gentle and loving disposition.

Rochester, O.

M. W. SHEPHERD.

CARING FOR COMB HONEY.

SOME SEASONABLE HINTS FROM G. M. DOOLITTLE.

AS the time is near at hand when the main crop of white honey in sections will be taken from the hives, I thought that a few words relative to the care of it might not be out of place. Next to getting plenty of comb honey in sections, is the care of it. Many seem to suppose that the producing part is about all there is to any branch of business which supplies our markets with merchandise. How often we find butter, wool, maple sugar, meat, etc., taken to market in such poor shape that they do not bring as much, within 20 per cent, as goods of no better quality are selling for, where the producer understands that the placing of his product upon the market in attractive shape has much to do with the value thereof. It is said of a certain strawberry grower, who always produces very fine berries, and puts them on the market all fresh and nice, that he always finds a ready sale for his berries at a very high figure, while those of shiftless producers spoil on the markets without a purchaser. Thus he obtains more money for his few rows of choice fruit put upon the market in attractive shape, than is obtained from as many acres grown in a slipshod manner, and put on the market in an unattractive way. Honey is no exception to this rule, unless it is that the difference is still greater than on most other productions. Hence, to place our honey upon the market in the best possible shape should be the aim of every bee-keeper in the land. My aim has always been, not only to get the honey off the hives before it was soiled by the bees, but also to keep the combs as nice and perfect till they are placed upon the market as they were when first taken from the hive. This is no easy task; for from the first, honey is liable to accidents which, if they occur, soon reduce the price from that of a No. 1 article down to that of second or third quality. I once hired a man to help me remove honey from the hive, as I was nearly sick and unable to keep even with my work as I desired to; but after his working with me half a day I so improved in health that his assistance was no longer necessary. He would manage to get his fingers against the honey, so as to break the nice cappings to about every other box, in spite of all I could say or do; and if he did not do that he would get the corner of one box into the face side of the comb in some of the other boxes, till I actually believe I paid him 75 cents for doing me \$10 damage. Where a person is naturally sensitive, and wants things nice, as they always should be, such proceedings will cure a slight sickness quicker than a physician can. I give this illustration only to impress on the mind of the reader that the utmost care is necessary at all times

when handling section honey, so that it may be kept in its virgin purity if we would command the best prices in market, and not injure the same for some one else.

The lack of care is one great cause of the ruinous prices we are often obliged to take in the markets. Mr. A. takes his honey to market after it has stood on the hive till it is dingy with the soil of the bees traveling over it, and it is often put up in boxes or cases having a slovenly appearance, with a determination to sell it for what it will bring, which is often not enough to cover the cost of production of white honey. Mr. B. goes a few days after, with his snow-white combs put up in handsome cases, and finds he has to compete with A's in price, or not sell at all, as the parties having A's honey know if B's is put alongside of A's they can not sell a pound of A's till all of B's is disposed of; and thus the price paid for A's honey is used as a leverage to bring all honey down to that figure. These things ought not so to be, nor would they be if all would read our bee-papers, and not only try to see how nice they could put up their honey, but also try and not injure the market for some one else, thereby doing by others as they would have others do by them.

The first requisite in caring for our honey after it is taken from the hive is a warm room in which to store it; one that has a free circulation of air all about it as well as to be warm. Years ago it used to be the custom to store honey in the cellar to keep it cool, but I believe that all of our practical bee-keepers of to-day prefer a warm room to a cool one, on account of the honey sweating, or taking on dampness in a cool room, thus giving it a watery appearance. If left for a great length of time in such a place, the honey will often become so damp and thin as to burst the sealing, leaking badly, and souring so as to nearly ruin it. To secure a free circulation of air, as honey will take on dampness even in a warm room if the air is partially excluded from it, build a platform of scantling a foot from the floor, and six inches out from the wall, upon which to pile the filled sections, keeping them in the same position they occupied while standing on the hive. On warm days raise the windows on either side of the room, so as to admit all the fresh air possible; and as it comes toward evening, close them again. To prevent robbers coming in and also to let the few bees that may come in on the honey get out, cover the window (tacking it to the outside casing) with wire cloth, letting it go above the casing nearly two feet at the top, and keeping it out from the building half an inch or so by means of strips of that thickness tacked to the outside of the building. Examine the honey occasionally to see if the larvæ of the wax-moth are troubling it; and if so, fumigate it with burning sulphur. If you are careful not to get any sections having pollen in them in the main pile, it will be a rare thing that the honey will need sulphuring. Kept in this way our honey is always holding its own, or, if any thing, growing better; and if properly crated and put upon the market at the right time it will command the highest price, and you will feel a pleasure in the matter, never enjoyed by any one who does things in a slipshod manner. G. M. DOOLITTLE.

Borodino, N. Y., July 3, 1889.

Friend D., I am almost glad you have had experience with one of these individuals who will stick their fingers into nice sec-

tions of comb honey, or punch another section into it, or, in short, do every thing but the right thing. Nobody knows the real luxury of having a trained and experienced hand about him until he has tried working with the average run of people who are round hunting for a job. Now, it is a little funny that this individual didn't complain because you didn't pay him as much money as you did somebody else, or perhaps as you could afford to pay an experienced hand. I am sometimes tempted to lose charity for all humanity when I see people so fearfully awkward, and then indifferent about it afterward. Had this individual of whom you speak said to you, "Neighbor D., you are setting me at something I never did before, and something in which I have had no experience; I really fear that I have been more trouble to you than I am worth; and if you will let me stop right where I am there shall not be any charge for what I have done. Nevertheless, if you wish me to go on I will try to see if I can not do a little better," all would have been well. Where I find people ready to speak out and show the spirit of something like what I have just quoted, it makes me feel hopeful. But where they do not say a word, and never offer to pay for the mischief they have made, it gives me a very sorrowful feeling, and I lie down at night weighed down by the fear that thousands upon thousands will *still* be without employment as long as the world lasts. You see, you have unconsciously touched upon the absorbing topic of my life—WHAT TO DO. Now, then, to the great wide world of working people, I want to say that friend Doolittle has, in his little sketch, told exactly *why* many of you are without work, and why you do not get *better* pay than you are getting now. It is because you do not enter heart and soul into the work that lies before you, and fall in line with your employer's thoughts and ideas, and try to save his property, and *help* him to get a good price for his product instead of helping to make it unsalable. "Whatsoever thy hand findeth to do, do it with thy might." Yes, one word more: I do not wonder that you got well, old friend. My health improved once amazingly in a very short space of time, when I found one of the boys *digging up* a crop (just planted) with a *cultivator*. And here comes in another moral: I am sure we often imagine we are sick, especially during hot weather, when the truth is we simply want *stirring up* and *shaking up*.

VANDEUSEN REVERSIBLE FRAME, AGAIN.

1 3/4-INCH SPACING PREFERRED TO 1 1/2 INCH.

I HAVE read Z. T. Hawk's article, page 513. In your foot-notes you say that 1 3/4 is too close spacing for frames; that in reversing, changing ends, or changing from hive to hive, they will not match. Now, I do not count my hives by the hundreds, but I have known what it was to have the care of 300 hives per year, and not less than 175 any one year for the past 11 years, and I have handled those 1 3/4-wide end-bar frames, and

they were reversible, by the hundreds, for the past 8 years, and I have yet to find that trouble of not being able to change them from hive to hive, end for end, and from bottom to top. I did find plenty of trouble with all that were $1\frac{1}{2}$ inches wide, and, as Mr. Hawk says, there is an invitation to clougate the cells for honey with the $1\frac{1}{2}$ -wide end-bar. Before reversing-wires came into common use I let my top and bottom bar project $\frac{3}{4}$ at each end; rabbets were used at the top and bottom that were detachable, the hive being reversible as well as the separate frame, making a space above and below the frames. A reversible frame without a wide end-bar loses half its worth, not only with me but with many others. The space at the ends of the frames is worth as much for its winter benefit in preventing frost at each end of the hive as it is worth for moving the hives from apiary to apiary, or from stand to stand; the same projecting arm, and $1\frac{1}{2}$ -wide end-bars has been the main feature of the shallow hives with frame of inside measure of $4\frac{1}{8} \times 17\frac{1}{8}$, and double rabbets that were taken from the half-story surplus frame of J. H. Nellis, in 1878. Several of us tried the $1\frac{1}{2}$ wide brood-frame for several seasons, and the $1\frac{3}{8}$ -wide side by side, and the troubles that disgusted us with the $1\frac{1}{2}$ frame were not found in the $1\frac{3}{8}$ frames. The first $1\frac{1}{2}$ lot of frames were made by accident; and when they chanced to come together they set us to thinking about the difference between them. I know of six apiaries where the $1\frac{3}{8}$ frames are used, and not one will take a frame $1\frac{1}{2}$ wide, and they would be thrown at you if you gave them to the apiarists. With the shallow $4\frac{1}{8}$ frames, inside measure, the $1\frac{1}{2}$ frame is too wide positively. There are 5 apiaries that I know of where both the wide and narrow end-bars are in use, and I know what their owners say; it is, "Give me the $1\frac{3}{8}$ frame every time." Some of them have been in use for eleven years, and the $1\frac{1}{2}$ frames have been planed down to $1\frac{3}{8}$ wide; but this much I am forced to say by practical use, and from years of use too—give me the $4\frac{1}{8}$ deep frame, 2 stories high. I am aware that there are twice as many frames to handle separately, and that it is twice the work to make them up; that they cost more; but when I can handle five hives of two stories each, in the same time that I can handle three that are of the L. frame depth, it will pay the difference in one season; then there is one point that was shown to me ten years ago this summer: Split the brood-chamber of an obstinate colony in two, and place your crate between them, filled with boxes full of full sheets of fdn., and your fdn. will quite often change shape before morning.

But here I must mention one point in reversing frames that several years' practice has shown positively true. If half the frames, that is, if alternate frames are reversed, the honey is more sure to be removed than if the whole are reversed, which is an objection to the reversing of a deep frame, and this same object is again shown in another form by changing places with the shallow frame-cases. The honey in the upper half of the top case is placed between the brood, which is an objection to the bees, and up to the sections it goes; and in the spring again it tells in building up colonies: reverse alternate frames, and the queen will surprise you with the increase of brood; and likewise by changing places with the shallow frame-cases, the empty space, like the honey, is brought between the brood. These things have been tried all

through the eighties by more than myself, and the reversing alternate frame has shown the difference here in the Grove Street apiary, and those of our near neighbors here in New Milford. We have whole cases of sections full of honey and capping, while our neighbors all around us are saying, "My bees are doing nothing." Our full cases that are capping are counted by the dozens, and there are only 75 hives in this apiary. The deep frame, when the whole set are reversed, will quite often cause the brood-chamber to be completely packed with honey, when, if alternate combs are reversed, it in all cases brings honey between the brood top and bottom of the frames. The bees don't like it that way, so they move it. H. L. JEFFREY.

New Milford, Ct., June 19, 1889.

Thanks, friend Jeffrey. I (Ernest) am quite sure you are right in regard to the $1\frac{1}{2}$ versus $1\frac{1}{8}$ inch spacing. I have been watching this very same thing very closely myself, and my observations confirm all you say with respect to it. I have noticed, over and over again, that even suspended frames, when spaced $1\frac{1}{2}$ inches from center to center, are bulged and distorted, generally, when the same frames spaced $1\frac{1}{8}$ are nice and even. The $1\frac{1}{2}$ -inch spacing, on account of the irregularity from bulging and bur-combs, makes it inconvenient, oftentimes, to change the relative position of some of the combs in the brood-nest. The bulged surfaces will often come together, and sometimes two concave surfaces. With the $1\frac{1}{8}$ -inch spacing, these difficulties, as you say, are scarcely noticeable. In regard to inserting the super between the two brood-cases, I will say that I have been trying that very same thing, with the Heddon hive. I *expected* that the bees would start filling out the foundation immediately. Although the colony is a fairly strong one, ten days have elapsed, and yet they have only just begun to work on the foundation. Here was an instance where theory seemed to be strangely at variance with practice. I can not understand it, because it seems strange that, with the brood on both sides, the bees should not connect the two with honey, especially when the queen herself is kept in the lower section by a queen-excluding honey-board. I feel almost sure that further trials will make theory and practice coincide. You intimate in your article that you have been using divisible brood-chambers clear through the eighties. You speak of using shallow frames made by J. H. Nellis in 1878. You have told us just enough about it to make us want to know more about it. It is pretty evident that you are an advocate of a shallow brood-frame; and as you have used them for a good many years, your experience might be interesting to the readers of this journal.—You say that a reversible frame, without an end-bar, loses half its worth, on account of its advantages for wintering. If colonies are wintered in the double-walled chaff hives, or single walls in the repository, it seems to me the closed uprights would not make any material difference in wintering. The Vandusen metal corners are giving most excellent satisfaction here. The end-bars of these are not closed, and no gumming together.

BEE CULTURE AT JAFFA, SYRIA.

SOMETHING FURTHER FROM FRIEND BALDENSPERGER.

SOME years back I tried tobacco smoke on a very vicious colony of Cyprio-Syrians. I could subdue them with nothing, being dreadfully stung. I smoked them *ad infinitum*, and was astonished to find them tumbling over and over at the bottom of the hive. I succeeded in subduing them. I did the same to a very vicious colony of Syrians soon afterward, but never tried it again, as I had no occasion for it. Very vicious ones are either discarded or else worked in just the time of day convenient. I think during the hottest hours of the day no robbery is going on; and the gentlest way a man can handle them is to use plenty of smoke to begin with before opening the hive. Tobacco smoke is the only remedy I know of to get down the *braula cæca*, which is often met with on bees. A queen-bee having often a number of these parasites, I pick up the queen by the wings and give her two or three puffs, and the little fellows will tumble down dead. Picking them off with pincers is very trying, as the animal does not keep quiet for a moment, but rushes about, the body particularly, when disturbed; the smoke does not injure the queen. Tobacco-blossoms also give honey, which has a slight taste of tobacco. I think the habit of smoking bees with tobacco originated with pipe-smokers (in Germany), as it is very easy for a tobacco-smoker to light his pipe, give a few puffs, and continue the use of his smoker at his pleasure. In Palestine tobacco is used very extensively, in cigarettes, pipes, and the well-known hubble-bubble, the arjelah, or water-pipe. A water-bottle has a stem of copper fitted to it with three openings—one in the water, one at the head where the tobacco is put, and one in the empty space above the water. The smoke, being drawn through the water, gets purified, and continues its long way through the various-colored leather tube, corded with silver wire, having a length of several feet, into the mouth. Bee-keepers here never use tobacco smoke for their bees. Horse or cow manure is the only fuel for smoking the bees, through an old water-jar, having a small hole at the bottom. The smoke is blown by the mouth—a difficult process. How thankful should we be to Mr. Quinby for giving us such a comfortable smoker! In bee-keeping for women, Mrs. B. supposes it quite work enough to do the necessities without looking for the pleasure of carrying them about for fun, as Mrs. Chaddock tells us. My wife generally holds the smoker while I handle the bees or shake them off for the honey, which I put in empty hives on a wheelbarrow beside me, which, though very clumsy in comparison to the one you advertise, still does the business well, taking four hives with 18 frames each. As soon as extracted, the empty frames are brought back and distributed, if possible, before sunset, as experience has taught many a bee-keeper never to handle bees after that. Robbers don't trouble us as long as honey is coming from the flowers; but as soon as the honey-flow is over, they are a trouble, it being impossible to work more than an hour at a time; then we stop again till they are dispersed. They also defend their hives well against intruders.

I suppose there is no established rule as to the age queens continue to lay well. Very much depends on their having been in a nucleus or very

strong colony, and also whether they have passed good honey-seasons, obliging them to lay extensively. Revising the apiary during April and May, being an interval with very little honey-flow, I try to put away such queens as seem to go back or stand still in brood-rearing, as we want a good number for the thyme-blossom. I took away the old queens at some hives, but found more of them had either raised another one, killing the old queens at once, and in one case they kept both queens; but they have finally done away with the old one. A hive having 9 brood-frames and upward may be considered a good one with us. Less than 9 frames is a poor layer in a season when pollen is coming in plentifully, and stimulative food being given. But then, again, you can't tell exactly when the queen stops laying, as you may look in for three weeks or more, finding an increase of one or two brood-frames each time; all of a sudden they stand still. From 15 frames you are tempted to take away one or two, and find the next time only 11 or 12 frames. I never clip queens' wings, but I keep a record of them all, and find I am always, or nearly always, well informed, as the trace, even, of a superseded queen is easily known. Take all in all, I think the end of the second season is just the right time to raise new ones, the exception also being for longevity the third season. Some queens will never be superseded by the bees—they live and die together.

A friend of mine came around the other day, and I read to him "Dot Happy Bee-man." As we both talk German, we laughed till our "schtomacks went schplitt."

Drones fly out and congregate on afternoons of warm days, as we frequently see. I have not yet observed whether they congregate at some particular point year after year, although I heard their loud roar one season, day after day, above the road I crossed to go to the apiary, but never could I distinguish them.

"All our eggs in one basket and too many irons in the fire," seems to be very general among bee-keepers; in fact, it seems as if most bee-keepers concluded, after a few years' trials, and hard trials too, that it is better to put "several irons in the fire." Being of the number, I must state, for the benefit of new comers into the bee-fraternity, they should not rashly do away with one business before having well grasped the other. When we began bee-keeping, all other occupations were discarded, to our great detriment. Slowly but surely they are taking their respective places again. What has been rejected is welcome again. Most bee-keepers live in the open country—at least they ought to for the greater benefit of their bees, and thus have an occasion to put up with live-stock, which comes in very handy at times; besides raising a few vegetables for the kitchen, this will help us a great deal to get along in a poor season. Since I find the question so largely discussed by many fellow-sufferers, I fully sympathize with them.

Our receptacles for holding extracted honey, come all the way from America to Palestine, and we find them a good deal cheaper than any thing that can be had here. I guess some of the readers of GLEANINGS will be astonished to hear it when I tell you that a thoroughly cleansed petroleum-can holds 50 to 55 lbs. of honey, and does the same service as new tins, and seldom have our customers had to complain about petroleum taste; this also was in former years. We take two petroleum-

cans and pack them into a petroleum-box, paying 5 or 6 cents each tin and box, soldering costing 7 cents each tin; nails and hoop-iron around the box, 3 to 4 cents, making a total cost of 36 cents for 100 to 110 lbs. of honey. If our California bee-friends could utilize the same, they could pack very nearly 3 lbs. of honey for a cent instead of one cent a pound, as mentioned on page 765, GLEANINGS, 1888. The tins are thoroughly cleansed by putting ashes and water, to stand a few hours, in the tins, and occasionally shaking them; after having rinsed them with fresh or warm water, a few drops of alcohol, lighted, finishes the whole. Can they not be had in their own country at the same rate, or cheaper, than some thousand miles away from their starting-place? PH. J. BALDENSFERGER.

Jaffa, Syria.

It is very interesting indeed for us to know that, away across the ocean, you have just about the same experience and difficulties we have to meet here. I am glad that you enjoyed friend Secor's poem. I felt a little anxious to know how it would strike our German readers. I hope that you and your friend both recovered after reading it. So you enjoy raising vegetables, as well as myself. You speak about the petroleum-cans of California. Why, my friend, the most common object to be found in any part of California is those empty petroleum-cans, and they have been for years utilized, or at least a great many of them, for honey-cans. Our carload of honey that came from California was put up in just that way. Even brand-new cans can be used now, at considerably less than a cent a pound per package. We now sell two of the cans, packed in a box, the whole arrangement brand-new, for only 65 cents, in 100 lots. Friend Woodberry, of Glendale, Cal., gets rid of the coal oil by simply making a hole in the corner, opposite the screw cap. After stacking them up in the dooryard for several weeks, the oil is entirely evaporated. There must, however, be two openings.

WHAT IS THE FINEST HONEY?

PRESIDENT MASON ANSWERS SOME HARD QUESTIONS.

THESE questions have been handed me to answer in GLEANINGS. The first is, "Is clover honey superior to all other honeys? and if so, why? What makes it so?"

This question might be answered by the word *no*, and truthfully so by a great many lovers of honey; and then others would just as truthfully say *yes*. If a person's taste or preference is to constitute the basis for judging, we can have about as many negative and affirmative answers as there are kinds of honey. Some have so strong a preference for buckwheat honey that all other kinds are not worthy to be compared with it, and some parties in this region think nothing in the line of honey is as good as some kinds of honey-dew.

To be a first-class judge of any thing requires a certain something that I don't know how to describe, and which but few seem to possess. An illustration has just come to my mind. I'm almost afraid to give it, for I may be wrong; but that isn't what I care so much about. Our sisterhood of bee-

keepers may take me in hand, and give me a good shaking-up, but I'll run the risk.

For several years I've had charge of what is known as the "exhibit of canned goods," at the Tri-State Fair at Toledo. It consists of canned fruits, preserves, pickles, etc., and it is quite an extensive display; and I have found it quite difficult to secure competent judges. It has been my experience, that, as a rule, it is somewhat difficult for ladies to agree as to which specimen is entitled to a first premium, and this is my reason: Each one will "positively declare" that the one that comes the nearest to her taste, or to what she has been accustomed to have, is the best, and does not take into account certain qualities that make it far superior to any other specimen.

Bee-keepers would scarcely be ready to admit that such as prefer buckwheat honey to all others, are good judges of honey, unless that preference is made subservient to *good judgment*.

In "Langstroth on the Honey-Bee," recently revised by the Dadants, it is said that "The whitest and best-flavored honey . . . is that gathered from white-clover blossoms," but no reason is given why it is best-flavored. I believe that white-clover honey is the best, not because it is the whitest or has a better flavor: for to me basswood (linden) honey is the best-flavored; and to others, raspberry, buckwheat, mangrove, orange, or some other honey is the best-flavored. I have had hundreds of pounds of basswood honey that was whiter than any white-clover honey I ever saw. There is something in the composition of clover honey that makes it more satisfying to the taste, that I can not describe, and is beyond the "ken" of science.

The second question is,

WHAT SHOULD GUIDE JUDGES IN JUDGING HONEY?

If judging honey at fairs is what is meant, it might be said that the premium-list should be the guide. For instance, the Buffalo International Fair premium-list says: "Display of comb honey, largest and most attractive," and the same in regard to extracted honey. In these, color and quality are not taken into account.

In the next premium it says, "Sample of comb honey." Here color and quality are the leading objects, and quantity and attractiveness are subordinate. Good judgment is quite a desirable commodity in judging honey.

The third question is,

IF JUDGING BY POINTS OF A MAXIMUM OF 20, HOW WOULD YOU ALLOT THE POINTS?

I don't think I would use a maximum of 20 points in judging honey. I should prefer not less than 30 or 40 points for extracted, and 100 for comb honey. For extracted honey, take into consideration the color and quality, the receptacle, and attractiveness of the display.

For comb honey, consider the size¹, shape², color, and cleanliness of the sections³; color of honey⁴; quality⁵; fullness of sections⁶; how filled at the edges⁷; evenness of comb⁸; empty cells⁹; general appearance¹⁰.

Judging by points takes more time, but will generally give better satisfaction than any other method, and can be applied to most things exhibited at fairs. The number of points can readily be arranged on any article by any person competent to act as judge.

A. B. MASON.

Auburndale, O., June 26, 1889.

Many thanks, friend M., for your valuable

hints. My opinion is, that people follow in certain ruts a good deal by the force of habit. It is so in selling honey. A certain style of package gets into the market, and people take a notion that they can not have it in any other shape; and sometimes it takes a good while to make a change. Basswood honey is certainly whiter than clover honey. I do not know that I ever heard anybody call clover honey handsomer, so far as looks are concerned, than basswood.

SWARMING.

THE THEORY OF ITS CAUSE, AND HOW IT MAY BE PREVENTED.

WHAT causes the swarming spirit of a colony? is a question not fully answered as yet. I will hereby give my theory, and I think it is as new as it is correct.

We know, that, 21 days after the egg is laid by the queen, the young worker-bee will gnaw out of the cell. Two days later it commences to work, but inside of the hive only. About 16 days later she commences to gather pollen and honey. In summer time the worker bee will generally be dead 27 days after the first flight; so we see that the proportion of brood, house-bees, and field-bees, is 23 to 16 to 27, in the normal state of a colony. Of course, this is correct only if the queen has laid the same number of eggs daily for some time. In early spring, when breeding commences, no house-bees are in the hive, and the older bees have to do their work. The amount of brood is by and by increased, and the proportion of brood to house-bees gets gradually nearer to the normal condition. As soon as the queen has laid, for more than 23 days, as many eggs as she possibly can, we have the normal condition, and the colony is on its highest point of prosperity. The growing number of honey-gatherers has meantime filled the empty cells of the hive partially with honey, and consequently the number of eggs daily laid by the queen is by and by decreasing.

It makes no difference whether the greatest number of eggs laid by the queen is attributable to her fertility, or to the room in the hive devoted to breeding, or whether the number of eggs laid is, later on, decreasing from any other cause; we always have the fact that hereby a surplus of house-bees is in the hive at a certain time, because more young bees will come from the cells as the queen lays eggs. These young bees are desirous of feeding larvae, but not all of them can possibly do so; and this condition of a colony starts the swarming impulse. The desire of young bees for more brood causes it. As much as possible, prepared food is given to the queen, and so she is induced to lay eggs in the started queen-cells, and a swarm is the consequence.

This theory explains every case of swarming coming to my notice, and the different ways by which swarming can be prevented to a certain degree. We know of

DIFFERENT WAYS TO PREVENT SWARMING.

1. If we remove some capped brood at the right time, and put empty combs, or, still better, foundation, into the brood-nest, we induce the queen to lay more eggs; consequently the house-bees have more work to do, and the surplus of house-bees dis-

appears. The next day fewer young bees will gnaw out of the cells, and the house-bees get less again, relatively to the brood. So this is a very good preventive of the swarming fever till the former condition of things reappears.

2. If we take some bees from a colony we get mostly house bees, because the field-bees go back to the colony. So this will prevent swarming for some days.

3. If we give to the house-bees more work to do, we can prevent swarming; so by cooling the inside of the hive. Then more bees are necessary to cluster on the brood, and swarming may be prevented for some time.

4. But the house-bees are the comb-builders too. If we give them occasion to build new combs near the brood-nest, swarming may be prevented in most cases, especially if the bees build combs for the purpose, that the queen may lay some eggs in them (Simmins method). These combs are clear profit to the bee-keeper. Why, I will show presently.

5. If we work our colony for extracted honey, and extract the honey from the combs in such a way that the queen always has plenty of empty cells, we shall have no surplus of house-bees, and swarming can be prevented. But we have to consider here, that a very strong colony needs relatively fewer brood-bees than a weaker one, so a strong colony may have a surplus of house-bees, if the proportion of brood to house bees is even not smaller than 23 to 16. So a very strong colony may swarm nevertheless, while a weaker one will not.

6. A moderate honey-flow which by and by crowds the brood, is just the thing to cause a surplus of house-bees, and so induces swarming. A very good honey-flow crowds, of course, the brood also; but the young bees will find plenty of work to do to prolong the cells, to cap the honey, and to evaporate the rapidly coming honey. Such a very good honey-flow gives plenty of work for young and old bees, and they pay very little attention to the brood.

I said that a surplus of house-bees will build combs at no cost to the bee-keeper. My theory is as follows: All the young bees feed themselves plentifully with pollen and honey, for the purpose of feeding the young larvae. If a surplus of brood-bees is in the hive, some of them will not find larvae to be fed; the larval food, or chyle, accumulates in the stomach, and will go through the stomach-wall into the blood. A surplus of blood is just the condition by which wax is secreted; consequently a surplus of house-bees causes wax secretion. If room and the necessary temperature are in the hive, new combs will be built; if the bees have no room for this purpose they build brace-combs, or thick wax lumps, on the top-bars of the frames, or they cap the honey twice as thick as usual. A newly hived swarm has no brood, consequently always a surplus of house-bees—at least the first eight days. In this time a swarm builds combs very rapidly, and at no cost to the bee-keeper, because this wax is secreted anyhow. We can observe this if we have a small swarm (especially an after-swarm) in a large hive, and the outside temperature is cool at night time, so that the cluster of the swarm is much contracted. We then find a great number of wax shreds on the bottom of the hive. This wax is secreted, but the bees can't use it, because the cluster is too small, and outside the temperature is too

low to form that wax into cells. If we give empty combs only to a swarm, this secreted wax is formed into brace-combs and wax lumps. The proportion of field-bees to the brood and house-bees is important too, and I hope to write about it in another article.

L. STACHELHAUSEN.

Selma, Texas.

Your suggestions are much in the line with those of our friend Hasty and Dr. C. C. Miller, although you have carried them a little further. I have often noticed the waste of wax by way of droppings on the bottom-board, brace-combs, and little lumps scattered about the combs where they were not needed, and extra cappings to the cells; sometimes extra thickness to the walls of the cells; and I have many times been impressed by the fact that these bees, were an opportunity given them, would build combs at no expense to the bee-keeper. It is along in this line of reasoning that friends Doolittle and Hutchinson conclude that bees will produce more honey, where they are obliged to build a certain amount of comb, than where the combs are furnished them. Other experiments, however (but they may be under different circumstances), indicate exactly to the contrary. See page 337.

BILL-BEETLES.

THE OREGON BEE-KILLER.

I HAVE received from Mr. J. J. McGowan, Swan Quarter, several of these weevils. They were all packed in a strong wooden box, with cotton, and every one reached me in good order. The number and excellent condition delighted me. Mr. M. wishes me to discourse upon the natural history of these insects.

These are known in the South as bill-bugs; but bill-beetles would be a more correct term. They feed upon the corn, and often do great damage. They insert their beaks and often destroy the young plants. This is a species of *Sphenophorus*.

I send a drawing which shows its natural size, form and general appearance. As will be seen, these beetles have a proboscis, or snout, and so are weevils. A species of *sphenophorus* (*S. robustus*) is said to

destroy corn in South Carolina and Alabama. It is also stated that this weevil breeds in the corn. It is black, and a little larger than this one. The species sent by Mr. M. is six-tenths of an inch long, and of a rusty gray color. The entire back is punctured. I can hardly suggest a remedy for these pests, as I have never had opportunity to study them.

OREGON BEE-KILLER.

Mr. R. W. Keeney, Pilot Rock, Oregon, sends me an asilus fly which much resembles the Missouri bee-killer, except that it is only about two-thirds as large. Mr. K. says, "These flies destroy my bees. They can kill any thing that flies. He often launches on hoppers three times his own size, which he can easily bear away. He does not eat but sucks the blood from his victims. As soon as he has sucked one dry he drops it and is ready for another."

Mr. K. thinks this fly about half grown. This is a very common error. Insects, after they have

wings, do not grow. The growth takes place while yet larva. All bee-keepers know that bees do not grow after they are mature. Of course, a full bee is larger than an empty one. Female insects, like queen-bees, may enlarge a little when in the height of laying, and shrink a little as the ovaries rest from egg-production. I presume this asilus is a new species. If so I will name him *Asilus Oregonus*, or Oregon bee-killer, alias Oregon robber-fly. The fly is gray, and about one inch long. See my Manual on "Robber-flies." These flies were somewhat broken. I hope Mr. K. can send me more in good shape. A little cotton prevents breakage.

Agricultural College, Mich.

A. J. COOK.

NOTES FROM THE KEYSTONE BEE-FARM.

NON-SWARMERS NOT NON-SWARMERS AT ALL.

WE have (I mean my wife and I) an Italian queen that I bought of Mr. Frank Boomhower two years ago, that had never swarmed. Our other queens have swarmed excessively. Last season I reared a fine lot of queens from her brood, and these also preserved the traits of their mother during the season. Thinking we had a big bonanza in the line of non-swarmers, we concluded to advertise through GLEANINGS, "Warranted non-swarming queens at regular prices," and I had actually written out what I thought was an attractive advertisement to forward for the June 1st issue, when our non-swarmers began to swarm, and now, June 17th, they have all swarmed. Even the original Boomhower queen has followed the example of her beautiful daughters. We have not tried to check swarming, because our strongest stocks are not storing any surplus, on account of the extremely wet and cold weather.

We have a Carniolan queen that I bought of Dr. Morrison last June. Sept. 1st she led out a large swarm. On the evening of the 8th, as I was making my usual round through the apiary I found, at the entrance of her old stand, seven young queens. They paid no attention to each other, but were determined to get back inside of the hive, which the workers would not allow, but would gently lead them out again. We had at that time a few queenless nuclei, where I ran the outcasts in, and five of them are to-day among our best laying queens.

From present indications we shall not secure any surplus until buckwheat and fall flowers, because the weather will not permit our bees to more than live and keep up brood-rearing from clover, and we are out of the range of basswood, which is four miles away. By way of experiment I think we will move a few colonies up to the basswood.

The Ignatum tomato seeds came all right, for which accept our thanks. We succeeded in getting 23 plants from the 25 seeds which the packet contained.

S. W. TAYLOR.

Harveyville, Luz. Co., Pa., June 17, 1889.

You have given us some very valuable facts. I have several times been told that certain colonies never swarmed. In fact, many have written that they had certain queens whose bees never sent out a swarm, and that young queens followed this peculiarity. I have invariably told such people to be slow in drawing conclusions; for my im-

pression was, that if a season should be just right for swarming, and the swarming mania should get into the apiary, very likely these non-swarmers would get a going, and swarm for certain, when they once got at it. Your story verifies the above. You should still try this queen and her progeny; and even if you find they are less liable to swarm than your other stocks, you are making some progress.

ALSIKE NOT A HYBRID.

SOME OF THE REASONS WHY IT IS MISTAKEN FOR A CROSS.

IN the issue of June 1st, Chas. L. Gough seems to have settled conclusively (to himself at least) that alsike is a cross between red and white clovers. I think it very unfortunate that that mistake was made by our botanists when they gave alsike its botanical name; and the sooner it is given another and less misleading one, the better. In your remarks to the article by friend Gough, you say: "If the seed you sowed contained no white clover at all, the phenomenon you mention is a mystery," etc.

To say, "There never had been a seed of white clover on the ground," as friend Gough puts it, is a pretty strong assertion; and if so, then the phenomenon would indeed be a mystery.

Last fall with us was quite wet, and this year white clover is very plentiful, especially where the ground was pastured closely. Alsike and red clovers do not stand pasturing like white clover. Clover seed will lie in the ground for many years; and when the conditions are favorable it will germinate. In the discussion of this subject some time ago, where friend C. F. Muth was interested (he having sold alsike clover seed, and the purchaser claimed that it came up red clover), I think the case would be of easy explanation if one knew the history of the ground for several years previously.

The hay I feed is mostly clover hay, and, of course, there is a large amount of seed in the manure. Some years ago I made a hot-bed, and the next year I used it as a cold-frame in raising radishes, etc., and the next year I threw the manure out, which was by this time thoroughly rotted, and the clover came up in it, to use a common expression, "as thick as hair on a dog's back."

Several years ago I broke up a hillside, sloping to the southeast (it being convenient to the house), and planted it in sugar corn, beans, tomatoes, etc.; the lower portion, which was more level, to potatoes. The next year I spread considerable manure from the horse-stable on it, and plowed it again, and plowed some ten or twelve furrows further up the hill. I planted it in peach-trees and in sugar corn, tomatoes, etc.; this year, also, the upper part, or sod, I planted in cucumbers. I cultivated as usual; and after my crop was "laid by" I sowed it in alsike clover (I had a little seed left from the spring, which I got from C. F. Muth). The next year I had mostly red clover; but above where I put the manure I had a beautiful patch of alsike, and below the manure it was mostly alsike.

Some three years ago I "stirred" with a double shovel some ground that had been in potatoes the previous year, harrowed nicely, and sowed in alsike and timothy. It was too late in the spring, and it turned very dry; and although there is oc-

asionally some alsike and hardly any timothy, I don't think the alsike and timothy turned to ragweed and briars, although I have plenty of them. I don't see any necessity of making a mistake in the seed of alsike, and white and red clovers, as they are so different in appearance.

A year ago this spring my brother sowed timothy and alsike on a field of wheat. On account of dry weather it presented a rather poor prospect when the wheat was cut; but the autumn rains helped the appearance, and now he has a fine field of alsike and timothy; and in places, where he hauled manure on the wheat ground, at a little distance it appears almost entirely red clover; but on examination there is alsike there also.

Georgetown, O., June 14, 1889. S. C. GORDON.

The point you make in regard to the dissimilarity of the seed is a good one. Every bee-keeper should be so familiar with the looks of the seed of all the clovers that he will not make a complaint that he has been humbugged in buying the seed. If the seed does not look as you think it ought to, send it back instead of sowing it and then complaining of the seedsman.

A NOTE OF WARNING.

A NEW BEE-DISEASE WHICH THREATENS TO ANNIHILATE WHOLE APIARIES IN CALIFORNIA.

YOU will doubtless remember my letter of last winter, about the new bee-disease. If you are not too much pestered by ignoramuses, and entirely out of patience, I will try to show that my trouble was not due to a local cause, but was the forerunner of what threatens to seriously cripple the bee-keepers of the State. With the opening of spring I find my entire stock of 170 stands "gone where the woodbine twineth," and the monster making serious inroads among my co-laborers. From what little I am able to gather, I believe the same thing is at work in Inyo, Ventura, and San Bernardino Counties. Developments are a little different now, as to symptoms, from my previous description; viz., of mature bees, abdomen distended, and hard trembling; listlessness, death; brood baldheaded; many dead, two-thirds or fully developed sticking in the cell; queen a failure, and moth completes the work of destruction. So far as I am able to learn, there has not been over two per cent of natural swarming through apiaries in this county. We have arrived at the goal for which our eastern brethren sigh—non-swarming; but like the man whose cow had learned to live without eating, death closes the scene.

I was sorry you apologized to Dr. Mason, for I saw by the twinkle of his eye, in his thought he said, "Now, I have got A. I., and I will just fix him this time, because I just know what I am talking about." That is the style of men that we want to keep talking just as long as they are in good humor; and the doctor has lots of that. Now, my purpose in writing to you is to hook on to the doctor or Prof. Cook, or some other good-natured scientist, who would take an interest in an investigation; also to stir some of the bee-men of this State, and sound the note of warning ere it is too late, if it is not already.

I should like to know what it would cost to make a microscopical examination and analysis of the

honey, etc. Although I am not a scientist, and have no facilities for fine work, yet I will venture an opinion that a fungus or animalcule resides in the honey, or about the hive. This State is overrun with minute pestiferous things, roaming about seeking whom it may devour, and it gets therein all cases. If I mistake not, this thing of which I write will, ere the new year, make a pretty clean sweep of the principal apiaries in this county. I am melting combs and clearing up, with a view to quit the business. Others concur with me in these views of the situation.

W. A. WEBSTER.

Bakersfield, Kern Co., Cal.

It seems to me that you are taking a rather dismal view of the matter. I may be mistaken, but I can hardly think that this one you mention is any thing more than a temporary matter. We should be very glad to receive reports from your neighborhood in regard to it. There is one thing, however, that does disturb me somewhat. When I saw the ravages made by the parasite on the orange-tree, and realized how plentiful were house-flies even in January, it occurred to me more than once that in a climate without frost and snows, insect or fungus enemies can get a going; and who shall say where the end will be without any frost to cut it short, as it cuts short the yellow fever in Florida?

BEE-KEEPING IN CUBA.

CONTINUED FROM LAST ISSUE.

IT will be seen that we have a steady flow of honey during the entire year; that there is at no time a complete dearth of honey, such as occurs in all of the States at times; that during at least eight or nine months of the year, the bees obtain more honey than they need for their own use; that the flow commences very slowly, gradually increasing for about four months, then as gradually decreasing for the same length of time.

Cuba is like all other countries in the fact that, while many different kinds of flowers yield honey, the surplus is obtained from two or three kinds only. At least three-fourths of our surplus comes from the bellflower, or *bejuco campana*, or *bejuco aguinaldo*; a correct description of which, but not a correct engraving, will be found on page 767 of GLEANINGS for 1886. The habits of this flower are very peculiar, different from any other honey-yielding flora I know of, it being a daily and not a constant flowering plant. The flower opens out in the morning, continues in bloom the larger part of the day, then closes up, wilts, and finally drops off, having lasted one day only. The most peculiar thing about it is its great irregularity in amount of bloom from day to day. One day we may not be able to find a hundred blossoms in the course of an hour's search, while on the next the fields and hedges may be white with bloom; the next day, half as many; the next still less, and so on. The daily yield of honey fluctuates in almost exact proportion to the amount of bloom. A study of the table of daily yields during December and January, as given on page 540, may not only be interesting to those who are in the habit of keeping such records, but shows very accurately the amount of bloom each day.

The next in point of value to the campana is the royal palm (and a royal tree it is too), which yields honey at all times of the year. I doubt whether we ever get much surplus from it, but its habit of yielding some honey steadily during the summer months, when few or no other flowers yield any thing, makes it of great value to the Cuban bee-keeper.

There is also a species of Spanish needle which commences to yield honey in September, and is still in bloom. A detailed description of the minor honey-plants here would not be valuable to your readers, as they are unlike any in the States.

Bell-flower honey is of excellent quality, in color about like basswood honey; body nearly or quite equal to white-clover honey, while in flavor it ranks next, in my judgment, to that honey. The flavor is more pronounced than is that of mangrove honey, but not as sharp or aromatic as either basswood or California honey. Honey from other sources is dark in color, of good body and fair flavor for dark honey.

Brood-rearing commences to increase about Christmas, increasing rapidly in amount until hives are full of brood and bees. All good colonies keep up brood-rearing during the entire summer and fall; but such colonies as do not gather their own supplies usually cease nearly all brood-rearing, except in lower stories, during the summer months, commencing again when the fall flow of honey sets in. The apiary was at its lowest ebb the first part of September, but from the 15th of that month until Nov. 1 it built up as rapidly as I ever saw bees build up anywhere at any time of year. About Nov. 1, queens generally commence to take their annual rest, but they do not entirely cease egg-laying at any time. We had to depend on the bees that were hatched out during October and November for our honey-gatherers during the main honey-flow. We have had so little natural swarming here that we know little about the time for that, except that the few swarms we have had, less than 20 in all, came out in February, March, April, May, October, and November. Probably having so many bees in one place is the reason why there has been so little swarming.

Some of the advantages here are the entire absence of swarming, and the small amount of brood in upper stories during the main extracting season. Nearly all can understand the value of these conditions. Queens are raised every month of the year; but it isn't best to raise any more than we can help during November and December.

Climatic conditions in Cuba make it necessary to work bees under sheds. Ours are covered with tiles; those at the Casanova apiary, with palm-leaves. The last are the best for all reasons, except danger from fires.

This last year has been the first one that any fully established apiary here in Cuba has been run for extracted honey alone. The Casanova apiary not having been, since it was built up, in charge of an experienced bee-keeper, and this one was run for increase the first two years. I have not only had to learn the peculiarities of a new climate and new location, entirely different from any thing I had previously known any thing about, but I couldn't follow closely in the footsteps of my predecessor, as he always worked for increase while in Cuba, and we cared only for honey this year. The work has been almost as fascinating as it was when first com-

mencing bee-keeping 20 years ago; but the result has been far from satisfactory or up to expectations, as can readily be seen by referring to back numbers of GLEANINGS, as follows: Page 744, 1883; page 593, 1884; pages 192 and 381, 1885; pages 621 and 767, 1886, and pages 506 and 611, 1887.

Now, what has caused this partial failure to secure a paying honey crop this year? On the correct solution of this question depends the future of bee-keeping in Cuba. Mr. Dussaq attributes the failure largely to the abnormal season, which has been as much so here in Cuba, as the past winter was with you in the States. While that unquestionably accounts for a part of it, I am inclined to think it is only a small part. There is no question whatever in my mind, but that we had fully twice as many bees here this year as were necessary to gather all the honey in our field. If Mr. Dussaq is correct in his opinion, this will not ordinarily be the case. I have watched the bees closely during the past year; have studied the history of the Casanova apiary for six honey seasons, and this one for three; and it is difficult to resist the conclusion that from 100 to 200 colonies of bees will store fully as much honey in one location here as will 500 or 600. There are probably locations in Cuba where this rule doesn't apply; but I am afraid that it does in this section of the island. Of course, a single season's experience doesn't positively prove this or any other opinion to be correct, and we are now working so as to have as many strong colonies as possible in our 500 hives at commencement of next honey harvest, and will give the matter a thorough test. I hope the result will show that I am wrong, as I shall be glad in this case at least, for the sake of those who have invested so much money in the business here, to part with some or all reputation I may have for possessing a clear candid judgment on bee-matters.

Notwithstanding the very medium results so far obtained, I find Cuba to be the most wonderful honey country I know any thing about, and have no doubt that bee-keeping can and will be made a decided success here, when undertaken under proper conditions and in a proper manner. All of my observations, as well as all evidence I can get from others, go to show conclusively, I think, that apiaries not too large for their location can be relied on to yield from 200 to 400 lbs. of honey per annum each colony, at a smaller relative expense than in the States. All ideas of immense apiaries in one location must be given up, and the same methods adopted as respects scattering bees as has worked so successfully with Messrs. Hetherington, Manum, France, and others, in our own country.

There are many things about our living here, about details of management, etc., which I could tell that would be of material value to any one intending to handle bees in Cuba, and would be interesting to many of your readers; but I hardly think it would be of enough value to most of your readers to pay for the space it would occupy in GLEANINGS. If you think differently, say so, and I will try to jot some of them down between this and the busy season next fall.

Havana, Cuba, June 1, 1889. O. O. POPPLETON.

After reading your first paper on bee-keeping in Cuba (see last issue, page 539), I at once dictated an answer; but Ernest, overhearing me, remarked that the article was to be concluded, so my answer was not

put in last month; but with this explanation I will give it now. Here it is:

Now, friend P., you have, by your above report, made me wonderfully inquisitive. What do you do with a crop of honey amounting to 50,000 pounds? What is the quality? Where do you sell it, and what do you get for it? In your table I have not noticed more than 7 pounds per colony in a single apiary. A. E. Manum, away up in Vermont, gets over 30 pounds from a single colony in a single day. Now, will he please tell us how many bees were kept in the same apiary, or in the same vicinity, when he got that enormous product? Can't you arrange by irrigation or something else, so as to have honey every month in the year? and, finally, is there a spot on the face of the earth where GLEANINGS goes, where bees make honey every month, winter and summer? By all means let us have the details of management.

FINISHING UP CELLS IN THE UPPER STORIES OF FULL COLONIES.

J. D. FOOSHE GIVES FURTHER PARTICULARS.

I RECEIVED GLEANINGS yesterday, and read carefully your comments on my article on queen-rearing. You express some doubt as to its working, except under the swarming fever.

I will say, that, when I first found it out, my bees had about passed the swarming fever. We had some beautiful weather here in April, but very few pretty warm days in May, consequently we had no swarming, or very little, in May. We had almost all we had in April; so when I first found it out there was no swarming; yet they worked out as fine cells as any natural-swarm cells I have ever seen. Any of mine will work out all I give them after the cells are started, and will work only those where the cells are started. I have not had a single one refuse to work them out. Where cells have been started I have had several built out since writing the article, and I must say that I have the utmost faith in the plan in any season of the year where the upper story has bees enough in it. I prefer placing a frame of brood of all stages in the upper story by the side of the frame of cells. They work only those cells out that are started, and no more. They never pretend to start another. Under the swarming impulse I don't know but that they might start more cells, but up to the present they have never done so. One main reason that I prefer to give the colony a frame of brood is, that we sometimes have sudden changes of weather; and you know where there is no brood in the upper story, bees are very apt to desert and go below if the weather is cool. With the frame of brood, the bees will remain above, or sufficient to care for cells and brood; and then, again, I think the frame of brood attracts more nurse bees, and perhaps the cells get better attention. It is a little strange to place a lot of empty cells in the upper story one morning, and go back the next morning to see what advance they have made on every cell, not leaving a single one untouched. So far as I can discover, they seem to start on them immediately. The cells that are started and transferred should be started on eggs that are just emerging into a

milky state, or will be hatching in five or six hours after giving to a colony to start them.

Coronaca, S. C., June 19, 1889.

J. D. FOOSHE.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

PRODUCING SECTION HONEY ON BOX HIVES.

MR. ROOT:—I know it is a very busy time to stop to talk; but as you and most of the advanced bee-keepers have passed through what I am experiencing now, I thought a word of advice from you would be of great satisfaction. You may remember I told you that I was a rather small pioneer in the improved method of bee-keeping in this part of the country. I was made the object of many a smart joke on my crazy hobby; but my success in producing the nicest honey, and at the same time making some money, has turned the scale; there is quite an excitement springing up, and everybody appears to want to go into the bee-business. Men are coming from a range of several miles to get information and instructions how to proceed to get such honey, and as much of it, as I do, from a hive. I admit I feel ashamed that I know so little as a bee-keeper; but novices express themselves as being satisfied I know it all when they see my apiary with the beautiful white honey tiered up two or three crates high. Now, there is one thing I wish to consult you about, and it is a thing that has stirred everybody who has any kind of a gum, in these parts; that is, about using sections on common gum hives. I had a few such hives, and I made a crate to hold 18 one-pound sections, which are filled as nicely as on any hive, and the public have found it out, and many are coming to me for said crates, filled with sections to go on these gums, and they are running me out of supplies; hence the last orders. Now, is this a new thing, and am I responsible for breaking down the trade, by teaching everybody who has a gum, to produce section honey? S. DANIELS.

Pine Grove, O., June 22, 1889.

In our A B C book, at the close of the article on "Transferring," we gave a short plan by prying off the top of the old box hive and setting a Simplicity hive, filled with foundation, over it. It is true, there is nothing said about filling this Simplicity hive with sections, but the matter almost suggests itself, without being mentioned. In fact, it has been done a great many times, and the matter has been frequently mentioned in the journals.—Whenever any trade or occupation can be broken down by teaching short ways of accomplishing desirable results, by all means let it break. I think very likely that people who have bees in gums might do nicely in the way you suggest, and we thank you for calling our attention to it.

MORE EXPERIENCE WITH BEE-STINGS AND RHEUMATISM.

At my table, when eating honey, without any other conversation leading to it, a German friend, with much animation, told the following: "After the Franco-Prussian war I suffered rheumatism (as the effects of my soldier life) for three years, never able to work, and seldom able to walk. One fine

day in spring I coaxed them to carry me into the garden, and, sitting near the bees, I smelled honey and asked for bread and honey. The bees gathered around me, and, being left alone a short time, I tried to chase them off, and they stung me awful bad on the face and arms, fifteen or twenty stings before I got away. The swelling was terrible; but before it was gone I could walk; and when it was gone I was well, and never had rheumatism afterward, and immediately went to work." The name of this man is Henry Karstadt. I believe his statement. J. A. LOWE.

Hutchinson, Kan., June 28, 1889.

My friend, the above is very valuable; and from the numerous similar reports we have received, I am inclined to think that bee-stings are perhaps the best remedy for that fearfully stubborn disease, rheumatism, of any thing that is known. May it not be that the hot sun and open air have also something to do with it? I can readily understand how our poor friend K. should get stung in the way he mentions. The bees got enough honey from his bread and butter to put them into the right mood for stinging fearfully, just about the time it was gone. As he was helpless, he probably got a good sound bee-sting treatment, especially for the first dose.

ANOTHER HIVE-CART.

Seeing a cut in GLEANINGS of a wheelbarrow to lift and carry hives, I thought I would send you my arrangement. With it I can lift and carry the heaviest hives with ease. One handle is on a hinge, so it can be spread and closed up. The blocks and the handles go under the strips near the top of my hives.

WILSON'S HIVE-CART.

I think it could be fixed to go under the hives as well. The wheel is from a cultivator, and the springs from an old spring seat. A frame goes over the wheel to keep it from wabbling about, which it would do on the end of such a long spring. I have used this more or less for three years, and I think if it were perfected and made just right it would be quite handy. HENRY WILSON.

Clinton, Ill.

I will explain to our readers that our artist has not quite caught friend Wilson's idea. For Dovetailed hives, or hives whose bottoms may be fastened, instead of having a support under the bottom-board, a pair of blocks on the handles of the wheelbarrow fit into the hand-holes. With a movable-bottom hive, however, something must go under to keep the bottom in place, as shown in the cut. The frame mentioned, as attached to the springs to keep the wheel from wabbling, is omitted in the cut; and, in fact, friend Wilson has not made it plain just what this frame should be. A stout piece of flat iron, however, riveted to each one of the springs, and running over the wheel, with a sort of bow, would probably remedy the difficulty alluded to.

ARE THEY ONLY OLD WORN-OUT BEES, OR ARE THEY SOMETHING WORSE?

I mail you to-day some bees for microscopical examination, all dead in one hole, and alive in another. Our bees are dying by the thousands, and I have heard from 3 other bee-yards affected in the same way. It seems to affect the field bees most, judging from the fact of the wings of the dead and dying being ragged, and no dead bees are in the hives; drones are also suffering. The symptoms are a general languor, stupid dullness—in fact, they act drunk. When caught they seem to be unable to see, for they keep rubbing their eyes; and after a time, if the sun is shining, they will fly off. The honey-sac seems in all cases to be empty. They do not seem to die at once, but linger; and I am inclined to think in many cases they recover. They are scattered all over the yard among the grass, much the same as young bees after a swarm has issued. There is no tremble or shake to their actions, more than to chilled bees. All colonies seem to be affected. Clover is in bloom, and some sumac.

C. A. HATCH.

Ithaca, Wis., June 28, 1889.

Later.—Bees are not dying as much now as they were, with that peculiar trouble.

C. A. H.

Ithaca, Wis., July 4, 1889.

We are having a good deal the same state of affairs in our apiary just now; but I am inclined to think that it is nothing more than the fact that a large number of old bees have failed because their wings are worn out at about the same time. Another thing, I am pretty certain that the unusual amount of wet weather we have had for two months past has been unusually severe on the wings of our little friends. They came so near starving in June that they often ventured out between showers so much as to get their gauzy wings repeatedly saturated with rain. This would be quite apt to render the wings less durable.

IS IT TRUE?

While lying in the hospital here, I came across an item in the *St. Louis Republic*, of June 8, which I thought would interest you. I have clipped it out, and inclose it in this letter for you. I know nothing about the truth of the item.

E. HOSTETLER.

St. Louis, Mo., June 10, 1889.

The item referred to is as follows:

STUNG TO DEATH BY BEES.

Henry Wright, a farmer, living near Maud, in this county, was stung to death by bees at his home to-day. He had just started to this city, and was coming over a stile when the bees attacked him with the above result.

Shelbina, Mo., June 7.

Can not some one among our subscribers in the vicinity of Shelbina tell us whether the clipping is true?

A HORSE STUNG TO DEATH.

One of our subscribers from Australia, J. F. Johnson, Kyneton, Victoria, sends us the following clipping, taken from the *Melbourne Argus*:

EXTRAORDINARY ACCIDENT NEAR BRISBANE; A HORSE STUNG TO DEATH BY BEES.

An extraordinary accident occurred yesterday afternoon. A man was driving along the Bayswater-road, in the suburbs of Brisbane, in a spring-cart, with a number of hives of bees, when by some means he upset one of the hives. The bees attack-

ed the horse, causing it to bolt. After galloping for some distance the horse fell, and fractured its foreleg. The bees swarmed upon it, and soon stung it to death. So dense and vicious was the swarm of bees that the traffic on the road was suspended for a considerable time.

The facts may be exaggerated, but it will serve as a warning.

OWED TO P. BENSON.

I hav jist writ the followin' owed to P. Benson, wich I sen' fur publerkashun; to wit, viz:

When ere I tuk my GLEANINGS down
And got the "small fry" huddled round
Ter listen while I red,
The fust peace that must greetee hour eye—
Thur picturs, splained to each one bye,
Was what P. Benson sed.

P. has writ you menny er line,
An off his 'umor, we opine,
Has hit our funny box;
And that his poem on ther fly
Jist tickled till we'd almost cry,
You may jist bet yer socks.

And P.'s a genus, that he is;
An' when you git er rhyme of his,
Jist send the lines to me.
Of all the orthors that I mete,
None else has got the same concete
That 'umors with a bee.

An' doubtless P. spins from afar
His tails of myrth, with naught ter mar
His pleasant fancies fly;
And if ermongst the bees he thrid,
And they shud chide, you well mite bid
P. Benson a good-by.

THE HOME RUN.

For doubtless then tru 'umor'st find
Its instant vent not thro ther mind,
Nor by ther pens parade.
But P. would personate the fun,
And surely make a good home run
Without a poet's ade.

CHARLIE RYAN, *The Orange Poet*.

BEES AND FRUIT; A FRUIT-GROWER MAKES CHARGES AGAINST THE BEE.

There seems to be quite a prejudice in these parts against the honey-bees. See article published in the *Farm and Home*, of Springfield, Mass., June 15, which I inclose.

O. F. ANGELL.

The Dalles, Ore., June 24, 1889.

BEES SOMETIMES INJURE FRUIT

I see that the statement of the experiments of N. W. McLain, of Aurora, Ill., with honey-bees, is going the rounds of the papers as conclusive evidence that bees do not puncture grapes. As an ob-

server of the facts in the case, and a practical fruit-grower for the last 35 years, and with several colonies of bees quite a portion of the time, I am prepared to say that those experiments are not conclusive. Bees have striking peculiarities, and in none are they more peculiar than in their tastes. They attack certain varieties of peaches with great avidity, working through the skin and eating into the flesh even before the fruit is thoroughly ripe, while other varieties, to our taste sweeter and riper, are left untouched. Hale's Early is always a favorite with them, without reference to the supply of other food. Grapes they do not attack, except under certain conditions. These conditions apparently are that the fruit must be very ripe, the weather dry and warm, and other food scarce. They have sometimes destroyed, or rendered unfit for market, tons of grapes in our vineyards in a single day, puncturing the skin so that juice would ooze from several grapes in almost every cluster.

Lake County, Ohio. H. G. TRYON.

Friend A., I am glad you have called our attention to this matter. Mr. Tryon is not only one of the foremost horticulturists in the State of Ohio, but he is most excellent authority on any such subject. Perhaps after he reads over what I said some years ago about bees working on the peaches he may change his views a little. I quite agree with him in saying that Prof. McLain's experiments, to see if bees would eat fruit, amount to just nothing at all, and I was well aware of it at the time. Bees will not exercise their powers of pulling things to pieces when shut up in a wire-cloth house; and they may not exercise these powers, either, in the open air. If the experiment were made with all possible care, perhaps it would fail a hundred times; but for all that, I am satisfied there are times when bees destroy enough grapes to be quite a nuisance in a vineyard. I am aware, however, that they are blamed hundreds of times for what they never did at all. Perhaps friend Tryon is not aware that the bee-keepers and horticulturists of Michigan met in a joint convention some years ago, to talk over this matter. A great many grape-growers are bee-keepers also. Quite a number of them were present at this convention; but not one of them that I know of ever discarded bees because the bees troubled his grapes. Where both the grapes and the bees were his own property, he managed with very little difficulty so as to have no interference to amount to any thing.

MINERAL WAX; WILL IT COMPETE WITH THE ARTICLE FROM THE HIVE?

I inclose a newspaper clipping, cut from the *Southern Mercury*, published at Dallas, Texas, concerning a mineral wax. Can you tell us something about it?

W. A. CARTMELL.

Crowley, Texas, June 24, 1889.

A curious illustration of the treasures of the soil, often overlooked for a long time, is the discovery of mineral wax in Utah. It was discovered three years ago on the line of the Denver & Rio Grande Railroad, covering an area of 150 acres. Over 1000 tons a year are secured. It looks like the wax that is made by bees, and can be used for the same purposes. It is mixed with paraffine in making candles, and is used in the insulation of electric wires. It needs no refining for ordinary uses. The discovery is a hint to our land owners, that their farms often contain riches that are overlooked. The Pennsylvania farmers worked the oil-fields for generations without a dream of the wealth under foot.

I heard about the mineral wax when I was in California, and I believe that some samples were shown me; but I can not now

tell just where or under what circumstances. I think, however, some of the bee-men assured me that it would not answer for foundation. Will some of our friends in Texas, California, or Utah, give us more light on the subject?

CANNING CORN.

Some time since, I noticed a short article on canning corn. It said it is almost impossible to keep it from spoiling, and also expensive—too expensive for common practice. I will take the liberty of sending you a recipe for canning corn, that I have used with perfect success for five years, canning from 10 to 40 qts. each year.

Take the corn when it contains the most milk; cut carefully, so as not to get any of the cob, and can as soon after pulling as possible. To every 6 qts. of cut corn take one ounce of tartaric acid; do not can more than two quarts at a time, using acid in proportion. Your success is sure if you boil but 2 qts. or 3 pts. or 1 qt. in a vessel at a time. Have your right proportion of acid dissolved, and add it to the corn when the corn begins to boil. Boil the corn till done, using just water enough to cook the corn; do not have any juice left over when you put it in your can; close quickly. I cover the can with a little patch of muslin before placing on the cover. I prefer tin cans, and I do not have the sealingwax too brittle.

HOW TO PREPARE CANNED CORN FOR THE TABLE.

Remove the cover, drain off what little juice there may be, into a teacup, and save; pour the corn into a vessel; add sugar, salt, butter, pepper, and reserve the cream till you lift it for the table. Have dissolved in a cup a teaspoonful of soda. Add some of it, and let the corn cook slowly. Taste a kernel occasionally; as long as it is sour, add more of the soda water; boil the corn a good while. In case you should get too much soda into the corn, add some of the water you had poured off at first and saved; that is all the reserved juice is good for.

MRS. J. A. LOWE.

Hutchinson, Kan., June 28, 1889.

Very likely your plan will work, my friend; but is there not a good deal of fuss and bother about it, especially if one wanted to put up considerable? Our corn and tomatoes canned together, as described a year ago, have kept perfectly. The only difficulty we meet is, that the tomatoes are cooked fit for the table a good deal before the corn; therefore the corn must be separated from the tomatoes and cooked by itself, to have it real nice.

THE GOLDEN BEE-HIVE, AND BY WHOM PATENTED.

I see in GLEANINGS you are getting after the Golden bee-hive men. They threatened to prosecute me last season for infringements on the Golden hive, but I told the persons who told me, I had books to show the model of my hive. Mr. Henry Weaks, Dover, Tenn., has the county right for this county, and Mr. John Parker, same address, sells them for him. They sold to several neighboring bee-keepers. I have made some of the Golden hives, and have transferred and divided some for my bee-keeping neighbors. They furnished one of A. I. Root's cold-blast smokers and a little pamphlet with the hive. The book doesn't say any thing about the Golden hive, I think, but it is a treatise on bees. I have never read the book. The patent

was issued to D. Thompson, Nashville, Tenn., July 3, 1877, for a term of seventeen years. Your article on "Debt and Credit" I call excellent, for it seems to hit the nail square, and drives it up. I follow the mechanical trade of iron and wood worker, and I find persons, it seems to me, who could do better than they do.

S. L. MEDLIN.

Moltke, Tenn., June 11, 1889.

BLUE-JAYS BEE-EATERS, CAUGHT IN THE ACT.

Did you ever hear of blue-jays eating bees? I have killed three this spring, and found their crops full of bees. Now, don't say that they had picked up dead bees, for I saw one go from hive to hive and catch them as they were coming in. The other two were in an apple-tree which was very full of bloom, and on which the bees were working very strong. The jays were picking them from the bloom. My wife and I stood and watched them for some time until we were quite sure that they were catching bees, and then I shot one. The other was so intent on getting his dinner that it did not fly. I then shot it, and on examination found them both loaded with bees.

J. CONGER.

Wyoming, Ill., June 24, 1889.

I believe we have had similar reports in regard to blue-jays before; but they are, perhaps, not as much addicted to eating well-filled honey-bees as are the king-birds. See description of the matter in the A B C.

PROSPECTS IN ARIZONA.

Times here are dull. Honey sells at 5 cts., and wild bees are filling the cavities among rocks, in the giant cacti, or even hanging a cone in thick brush. The harvest is nearly past. Early peaches, with apricot and first fig crop are about gone. Grapes will soon be ripe, of such quantity and quality as have no rival. This is a beautiful "sun-kissed" clime, with sometimes a little too much of the "kiss." Oh, yes! I have a brother of yours for near neighbor. I am wondering if I should like you as well.

B. F. JOHNSON, SR.

Tempe, A. T., June 15, 1889.

Just as soon as my eye caught your letter from Arizona, I began wondering if you were anywhere in the vicinity of my brother. I know what a large area Arizona has, and our readers remember, doubtless, my description of its weird wildness. If that brother will stick to one spot long enough, I should like very much to make you all a visit soon. Do you mean to say that real nice honey sells as low as five cents?

FRADENBURG IN MONTANA, AND WHAT HE THINKS OF THE LOCALITY AS A BEE COUNTRY.

Perhaps many of the readers of GLEANINGS would like to know if I meant what I said last spring when I said that I was going to Montana. Well, here I am in this far-off land. I came here about the middle of May, and about the first person I met here was friend Bingham, the smoker man, from Michigan. Although we had never had a personal acquaintance before, we became friends at once. This is no place for bees. I have seen but one stock since I have been in this State, and it was one a friend brought to Box Elder, a station 50 miles east of here, from Port Washington last March, and they looked badly demoralized, being nearly starved, and dwindled to a mere handful. I presume they have all died ere this. This town has

been settled for 20 years or more, but I can't learn that there has ever been a bee brought here. There are no trees that would produce either pollen or honey of any account. There are some spots of wild weeds and flowers, but they don't look to me to have life and vitality enough to secrete much honey, even if there were bees to call for it; yet I may be somewhat deceived, as this is an exceptionally dry year for this dry country. Their usual rainy season is now nearly passed, and scarcely a drop of rain has fallen. I expect to remain here a week or two longer, and then return to my home in Port Washington, Ohio.

A. A. FRADENBURG.

Fort Benton, Montana, June 18, 1886.

WIDE FRAMES AND HONEY-BOARDS

For some years I have used wide frames for section honey, without honey-boards, and I have been annoyed on account of the bees fastening the bottom of the wide frames to the brood-combs. Often, in pulling the wide frames to get them loosened from the brood-combs, the latter would fall with a tremendous jar, thus greatly disturbing the bees, and often irritating them. I have often wondered how this could be avoided while using wide frames. If a honey-board is used, the tops of the frames are raised too high to let a flat cover go on the hive. I have thought that a honey-board could be used, and cleats tacked on the projections of the wide frames, to raise them a bee-space from the honey-board, thus obviating the crushing of bees while handling the frames; but in this case a half-story cover must be used. Do you know any better way to overcome the difficulty?

T. E. HANBURY.

Atlanta, Ga., July 1, 1889.

If you will turn to page 24 of our price list, you will see illustrated a honey-board, and alongside of it a rim. The purpose of the latter is to raise the upper story of the Simplicity hive up so as to leave a bee-space under wide frames, or frames for the extractor. The honey-board will obviate all the troubles of brace-comb attachments between the brood-frames and the wide frames.

A RATTLESNAKE AMONG THE COMBS OF A BEE-TREE, DEAD, AND HIS MOUTH WIDE OPEN AND FILLED WITH HONEY.

Seeing in GLEANINGS that bees do not like snakes, I will tell an incident that occurred within half a mile of here. Last Saturday two colored men cut a bee-tree; and in taking out the combs of honey they found a large rattlesnake, which had crawled in the tree at the ground, and up the hollow to the combs. Being about 20 feet from the ground, the combs were built around him and even attached to his body for about 2 feet. He died with his mouth open, and the bees made combs in his mouth, and filled it with honey. I did not see this, but I saw the man who took the honey out, and he told me the story. Now, what did that snake go up there for? Did the bees kill him?

Our bees have done very well this spring; very little increase.

D. D. SLATER.

Blackville, S. C., June 6, 1889.

I think the snake had learned to eat heavily laden bees, and possibly to eat the honey out of the combs; and I presume likely the bees stung it to death. If anybody else can explain the matter any better, we should be glad to have him do so.

REPORTS ENCOURAGING.

BOOMING.

OUR bees are just booming. We are extracting right along, and that is very uncommon for this time of year here; but the white clover has yielded us lots of honey, and the linn will soon be on hand. That will give us another week's flow that will give us barrels of honey. As a general thing we get our honey in August and September; and if that keeps up in proportion I don't like to try to guess how much honey we can get. J. PARSHALL.

Skidmore, Mo., June 21, 1889.

Clover is in full bloom, and honey is coming in fast, with prospects of a good yield.

Nashua, Ia., June 19, 1889. G. W. STOCKS.

THE GREATEST HONEY-FLOW FOR YEARS.

We are having the greatest flow of clover honey that I have known in 15 years.

Centerville, Ia., June 24, 1889. G. B. REPLOGLE.

ITALIANS AHEAD OF BLACKS FOR HONEY.

We have succeeded in preventing swarms, and secured an average of 28 lbs. from blacks, and 38 lbs. from Italians, of nice section honey, and have two supers on each hive, with 56 sections, from a good start of comb, all the stages to nearly sealed, and we hope to get an average of 75 lbs. or more of white clover honey, then we expect a good flow from Spanish needle next fall. W. W. ADDISON.

Bumpus, Ill., June 29, 1889.

ANOTHER HONEY-QUEEN.

White clover is abundant. Basswood opened yesterday. I pass two trees four times a day; new honey has been in the market 3 weeks. I have taken 48 lbs. from one colony, more beautiful and delicious than I can describe. No other colony in the same yard approaches this one; only a part of the others are at work in the sections. Our boss honey-gatherer is a match for your "honey queen."

Madison, Ind., June 18, 1889. J. CADWALLADER.

BEEES DOING FINELY.

Bees are doing finely on clover. Basswood will commence to bloom in three or four days. We expect to extract on the 17th. Owing to many rainy days and very cool nights for some time past, the bees have not stored as much honey as we think they would have done, had the weather been more favorable; yet they have done well, and perhaps the abundance of rain may improve the future crop. MILLER BROS.

Bluffton, Mo., June 13, 1889.

THE SEASON IN CALIFORNIA NOT A FAILURE, ETC.

I see reports from various sources, that the honey-crop of California is a failure for this year. Now, such statements are very misleading. The season is only half over, and the yield in some localities in Southern California is quite up to average years, and the quality of the honey is superior to most years, both as to flavor, body, and color. In former years I have extracted honey as late as October 17, and then have the bees fill the upper hive with fair honey for their own use. The abundant rains of this year almost insure a yield of honey late in the season. I have about two tons of nice sage honey now on hand. C. A. WILSON.

Los Angeles, Cal., June 25, 1889.

IN THE BASSWOOD BELT; PROSPECTS FAVORABLE.

I wintered 80 swarms in my cellar last winter, and lost two. I lost some this spring, and sold a few, so I have 66 left in my two yards. Last year, from 32 swarms I made one ton of honey in basswood bloom. This season, white clover is looking well and our bees are doing well. The basswood is very full of buds, and will be in bloom about the 10th of July. That will be our main crop. We should like to have you come out here during basswood bloom. If we have the right kind of weather you will see some good work done in the bee-yards.

Viola, Wis., June 24, 1889.

B. W. LAWTON.

REPORTS DISCOURAGING.

LONG FACES.

Bee business is dull, discouraging, which accounts for being slow in renewing. For three weeks bees have been sitting on the portico of the hives, watching the rain with long faces.

Lyons, Ind., June 12, 1889.

J. SCHOLL.

CALIFORNIA A LITTLE MORE HOPEFUL.

Since I wrote you last, we are having a little more honey; but the crop is, or will be small. Unfavorable weather is the cause. A number will not make expense of running. M. H. MENDLESON.

Ventura, Cal., June 11, 1889.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

CHAPMAN HONEY-PLANT.

The Chapman honey-plant began to bloom June 19. I have just measured some of the plants. The largest measures just 7 ft. 2 in. in height; average, about 4 ft.; heads on the largest plants, from 30 to 40. M. S. PERCIVAL.

Rugby, Tenn., June 25, 1889.

BEE-STINGS A POSITIVE CURE FOR RHEUMATISM.

I have been troubled for years with rheumatism; and when punctured a few times by the bees I found I was entirely cured. The fluid extract of bee-sting is an old eclectic cure for rheumatism.

Kirkwood, O., June 24, 1889.

M. N. McNEIL.

WHITEWASH INSTEAD OF PAINT, FOR HIVES.

I have been using common whitewash on my hives for three seasons. I have had from 40 to 75 colonies. I find it cheap, and it gives the hives a neat clean look. I think it is cooler than paint, and at the same time it helps to preserve the wood. I should like to know if anyone else has tried it. It takes only a few minutes to apply it. I can always have my hives looking fresh and white.

Musson, La., June 21, 1889.

DR. A. W. TUFTS.

DOOLITTLE'S NEW BOOK.

Doolittle's new book is very interesting; but I know by experience that his new plan of raising queens in full colonies over a queen-excluding honey-board does not work every time. In this locality, during the horsemint flow every queen-cell will be destroyed. May be it would work with the cell-

protector. I have not tried it as yet; but I believe the plan will always work in spring, and as long as the colony is inclined to swarm.

Selma, Texas, June 7, 1889. L. STACHELHAUSEN.

VERITABLE ROBBER-BEES.

Mr. A. C. Waldron sends some small shining hairless bees that are robbing his bees. He says they attack only one colony, and are very numerous. These are common honey-bees, hybrids (Italians and blacks). They are small, shining, and black, as they have had nearly all the hair pulled out. They are veritable robbers.

A. J. COOK.

Agricultural College, Mich.

GALLBERRY HONEY.

I this day send you a sample of extracted gallberry honey. This is the first honey for market; and the six years I have been here it has never failed to give a good crop. Please give your opinion of the same. I think it quite nice, and should not be classed as Southern honey.

S. C. CORWIN.

Sara Sota, Fla., June 16, 1889.

[The sample came duly to hand. The color and body of the honey are good. While we do not think that the flavor is quite equal to that of white clover, yet it ought not to be classed with the ordinary Southern honey, so called.]

IS HONEY FROM CATNIP BITTER?

I had a large quantity of catnip in my yard. I was talking with a friend a few days ago, and he said that catnip would produce honey that was bitter. I should like to have your views on it. If I thought it would be an injury to the honey, I would cut it all down.

THOS. PHILLIP.

Holland Store, June 7, 1889.

[You are certainly in error in thinking that the honey from catnip was bitter, or even poor. Some years ago one of our bee-friends planted catnip largely for honey alone, and he found the quality was very fine. It has a somewhat aromatic flavor, like that from the mints and basswood; but this flavor is not bitter, and in no way objectionable.]

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 135.—a. *When, in your locality, does white clover first begin to yield nectar?* b. *How long does it usually last?* c. *What other sources have you for white honey?*

a. May 25 to June 10; b. 4 weeks; c. None.

DADANT & SON.

a. About June 10; b. It lasts till about July 10; c. Basswood.

GEO. GRIMM.

a. About June 10; b. Lasts from two to four weeks; c. Linden.

A. J. COOK.

a. As a rule, with the beginning of June; b. As a rule, to the beginning of July. c. None.

C. F. MUTH.

a. Usually about June 15; b. From two to three weeks; c. Raspberries, sumac, and basswood.

A. E. MANUM.

a. About June 10. b. Until July, or until basswood gives nectar. c. Raspberry, willow, sumac, linden.

RAMBLER.

a. About June first; b. From two to three weeks; c. Basswood and sweet clover.

A. B. MASON.

a. Generally from June 1 to 6; b. From two to four weeks; c. Basswood, red-root, and sometimes mint.

S. I. FREEBORN.

It used to begin about June 6; but for several years past the yield of honey from that source has been so light that it has been a little difficult to tell just when it began and when it left off. c. Basswood.

H. R. BOARDMAN.

Usually bees commence on white clover from June 1 to 10. There is some clover in blossom here now May 28. But the bees are not making a living. Weather is too wet and cold. For white honey in this locality we have white clover and basswood.

E. FRANCE.

a. Usually not far from June 20. b. From two to three weeks. c. Basswood. White clover is not usually a heavy yielder with us, bees working on a variety of flowers. The common daisy often furnishes honey enough for brood-rearing, for a short time.

P. H. ELWOOD.

a. I have seen white clover in bloom in January, but never had any yield from it before March. b. About July 1. Some favorable seasons it will last till August. c. In the fall we have the smartweed and eupatorium, which yield lighter honey than white clover.

PAUL L. VIALON.

a. It varies at different seasons, all the way from the first to the last of June. b. The heavy flow from white clover usually lasts from 10 to 20 days; but a very moderate flow will sometimes last six weeks. c. A very small amount of basswood. This refers to my Iowa location, as my answers all do, when different locations would make a difference in the reply.

O. O. POPPLETON.

a. From the last of May to June 10. The bees don't seem to accomplish anything on it until about ten days after the first blossoms are seen. This year was exceptional. The first blossom was seen May 15, and three days later I saw a bee on a clover-blossom. b. Three to six weeks. c. Practically none, although cucumbers help some for winter stores.

C. C. MILLER.

a. Usually from May 25 to June 1. In a wet season, somewhat later. b. The first crop of white clover, ordinarily about a month; if the rainfall is plentiful, younger plants come forward and even new ones from the seed, so that the flow is extended almost through the entire season, although the yield may not be large; c. Apple-blossoms, raspberry, polygonum, blackheart. Apple-bloom is not very white. Linden in some seasons yields well; in others, not at all.

MRS. L. HARRISON.

a. We have no white clover at all, except with blue grass, in front dooryards. b, c. Wild alfalfa, white, purple, and black sages; black sage abounding in only a few localities, commences yielding, I will say, in the last half of April. Purple sage, perhaps the most abundant of any, especially near the coast, comes in the fore part of May; and white sage abounds in the more elevated districts away from the coast, in the last half of May. Wild alfalfa comes about the same time, or a little earlier, than white sage, and is about as good for honey. The time of bloom varies from one to six weeks. Each variety yields honey from four to six weeks.

R. WILKIN.

a. From June 10 to 20; b. About one month; c. Willow, apple, and teasel; but basswood gives far more honey than all the rest combined. Some years a little alsike clover is sown, which yields far more honey than the white, with us; but the honey is of so dark or reddish a color that I do not like it, on account of its being sure to spoil the looks of the first sections off in the basswood yield.

G. M. DOOLITTLE.

a. About June 1, varying about ten days one way or the other, according to the season. b. It always lasts clear into the basswood, which begins blooming July 1, as a rule, and many times I have known the bees to gather considerable white-clover honey after the basswood was over, after July 20. c. The basswood is our only other source after white clover, to any considerable extent. The pleurisy-root yields white honey and is a profuse yielder too; but as yet there are not enough of the plants in my locality for my large apiary to make much surplus from; however, it has been rapidly increasing for several years past.

JAMES HEDDON.

a. It comes into bloom about May 20, and begins to yield honey about twenty days afterward. I have kept close watch of this for several years, and here is the record—that for 1886 being lost.

	1884.	1885.	1887.	1888.	1889.
First bloom -	5-23	5-20	5-20	5-23	5-12
Began to yield honey	6-14	5-28	6-4	6-6	6-11

As will be seen, this year it bloomed earlier and began to yield honey later than usual. b. The yield runs into that from basswood, which begins about July 1, and does not amount to very much after that closes, about ten days later. c. Besides basswood, the crop from which grows less and less each year as the trees are cut down, we frequently get considerable honey from sweet clover, for which there is an excellent prospect this year.

J. A. GREEN.

White clover seldom yields much surplus before June 10 in this locality, although it blooms much earlier; and at the close it tapers off and mingles with other things in such a way that it is hardly possible to state its duration. Some years it seems to yield scarcely at all; but the fact that I do not see bees working on it is not full proof that they are not doing so on some other portion of their range. In regard to its blooming, I find the following on my records:

Year.	Began.	Closed.	Days.
1880	May 20	Aug. 15	88
1881	" 22	Sept. 11	113
1882	" 27	Sept. 13	118
1883	" 29	Oct. 7	125
1884	" 19	Sept. 6	110

As to other sources of white honey, I have some basswood. I used to credit wild basil and white cornel with furnishing considerable white honey; but with the lapse of time I have come to doubt it.

E. E. HASTY.

The above question was intended to indicate to some extent whether it is practicable to move bees from north to south, so as to keep in the clover bloom. Friend Manum, I believe, is the furthest north of any of our reporters, and he gives the date as June 15; while Freeborn, of Wisconsin, might be nearly as far north, he gives his report as from the 1st to the 6th. Friend Elwood, in York State, puts it not far from June 20. Friend Wilkin, of California, says they don't have any clover, which I was

well aware of. Friend Viallon says they seldom get any yield of honey from clover before March. Sometimes it lasts till August. My impression is, that we are indebted to white clover more or less in all our localities, say up to August or even later. Even here in Ohio I have seen quite a yield of what I pronounced white-clover honey, during August and September; and as the bees were working on white clover almost as much as on the red, it is difficult to decide, if, in fact, we can decide at all, which kind of clover gives the more. The above answers also indicate that basswood is not, as a general thing, as widely distributed as white clover.

QUESTION 136.—a. Do you ever get enough honey from red clover to secure a surplus to any extent? b. What is the most you ever secured from this source?

No. DADANT & SON.

No. H. R. BOARDMAN.

a. No. A. B. MASON.

a. No. b. (?). A. J. COOK.

a. No. b. None. E. FRANCE.

a. No. b. Winter stores. GEO. GRIMM.

a. No. b. I am not able to tell. P. H. ELWOOD.

No; but little red clover is raised near me.

O. O. POPPLETON.

a. No; b. It has been so mixed up with honey from other sources that it is impossible to tell.

MRS. L. HARRISON.

Several times red clover has been planted here; but I never had the bees gather any nectar from it.

P. L. VIALLO.

a. Only once in a great while we secure more honey from red than from white clover. b. I don't know.

C. F. MUTH.

a. I once credited red clover with a few barrels of honey, but afterward thought that the blue vervain should have had the credit.

S. I. FREEBORN.

a. No red clover here. I never got any that I knew of when I lived in the East, and even had my doubts of any one else getting any worth counting.

R. WILKIN.

a. No. b. I never learned. The yields reported from red clover, I think, are in localities where a second crop is raised for seed; the blossoms are smaller.

RAMBLER.

a. No. b. I don't know that I ever got any; but one year, during a yield of buckwheat, two colonies gathered light honey that may have been red clover.

C. C. MILLER.

Though I have known my bees to work on red clover, I never knew them to make much surplus from it, and I leave it altogether out of my calculation in estimating the honey-crop.

J. A. GREEN.

a. Only one year did I ever get any considerable quantity of red-clover surplus honey. I think nearly two thousand pounds of extracted honey was the amount that year. b. Answered above.

JAMES HEDDON.

Not of late years, as there is a little worm which works on it and this prevents its blossoming at all. In 1872 I obtained about 30 pounds of honey from this source from some of my best colonies, and did

nearly as well one or two other years prior to 1880. This was all gathered by Italian bees, while at the same time the blacks were consuming the stores which they had gathered from basswood.

G. M. DOOLITTLE.

Bees frequently work on it; and they surely would not work it for pollen alone in my location, where pollen resources are so great. I doubt, however, whether I ever realized any great amount of surplus from it.

E. E. HASTY.

No, not separate from white clover, as my bees work on both at the same time; that is, both bloom together here, and bees are seen working on both. My bees work well on the red clover some years when it is plentiful. I find that the dark or leather-colored Italians work on it much better than the bright yellow bees. Mr. Frank Boomhower, of Gallupville, N. Y., who advertises "red-clover queens," first got his stock from my apiary, when he said they were the first bees he ever saw work on red clover. b. I never get it separate from white.

A. E. MANUM.

The string of "noes" at the beginning would seem to indicate, either that red clover does not flourish everywhere, or that it does not yield honey very often. I feel like adding that the friends who say "no" have not observed as closely as some of us; may be, however, that last had better not be added. Muth says, "Once in a great while;" so we know he is pretty certain that he has had a good yield from red clover. Friend Freeborn once gave red clover the credit, but now thinks it doubtful. James Heddon has had only one good yield from red clover. Now, I am inclined to think, as in the question just before, that we are all indebted more to red clover than we know. In our locality you may go out into the fields in July, August, or September, and find Italians working steadily and busily on red clover, day after day, and week after week. And, while it gives a surplus only under very favorable circumstances, I feel certain that red clover keeps bees busy and out of mischief, and keeps brood-rearing going, and oftentimes enables them slowly to accumulate sufficient stores for winter, where it does nothing more. Ernest remarks that only last summer, the red-clover bloom gave enough honey so as to save quite a good deal in sugar feeding. The color and taste of the honey indicated pretty surely the source. In our locality, more or less red clover is always round about us, to the extent of perhaps 100 acres within range of the bees' flight, from which a good deal of clover seed is raised. What we call red-clover honey has a ranker taste than that from white clover. The color is a little greener. That a bee fills its sac from the blossoms of red clover, can be easily proven by dissection. You can also find the same honey by dissecting the clover-head. Sometimes the honey is scarcely perceptible, either to the taste or to the sight; at other times it seems to almost fill the tube of the blossom. At such a time, the bees work strong, and fill the boxes. A good yield of honey, however, from red clover, in our locality, is the exception rather than the rule.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: Sheer Off, Silver Keys, The Giant-Killer; or, The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room. We have also Our Homes, Part I., and Our Homes, Part II. Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

A WHOLE PLATEFUL OF HONEY AT A TIME.

My uncle Joseph has 14 hives of bees. He has taken 50 lbs. of extracted honey, and 50 lbs. of comb. But the rainy weather has been a drawback on the bees. He expects to take a nice lot more; that is, if it doesn't rain too much. I never used to like honey till this year, because when my uncle first kept bees I ate a whole plateful and it made me sick. I have a little playmate who likes to eat salt on honey.

MABEL BRIGGS, age 11.

Cornwall Landing, N. Y., June 17, 1889.

PAPA'S GREENHOUSE.

Papa has a forcing-house. It is 12 by 34 feet. It is covered with glass, and heated by a furnace, on the return-flue system. It is a perfect success. He has a lean-to on it and half of it is covered with glass. In that he keeps his furnace, water-tank, and also has room to transplant in it. He has the beds in the other part. He has about 2000 once transplanted Grand Rapids lettuce-plants. He also has cabbage, cauliflower, and tomato seeds sown, and has radishes up. He gives us children one cent per 100 for transplanting.

LOVINA E. WHITNEY, age 10.

Independence, Iowa, Feb. 15, 1889.

BEEES IN GERMANY.

Bees in Germany are doing very badly. My mother is there this year, and also my brothers, taking care of them. My mother is going to send me a photograph of our buckwheat apiary, of about 40 straw hives. You have no such hives in your A B C book as we have in Germany. My mother had the first swarm Pfingsten (Easter). She took some hives along, and other goods, to show the people in Germany. About half of our bees died last winter, for we had no one to see to them until mamma came out in spring. She is going to visit some large bee-men; and when she comes back I will send you a report of her journey. Papa is busy hiving swarms. He says the bees have no honey, and are doing little. Last year he and I extracted honey

ANNA BLANKEN, age 11.

Jersey City, N. J., June 26, 1889.

All right, friend Anna; let's hear from you again.

PAPA'S BEES.

My papa has 56 colonies of bees. He has had three swarms of bees this summer. We had a cold dry spell, and they did not gather much honey. Papa had to feed some of them. One colony of papa's bees was attacked by what is supposed to be the nameless bee-disease; but he took out the old comb and put in others, and saved part of them. He made a swarming-box; and sometimes when you would think the bees had all gone into the hive, they would all be in the swarming-box. Papa gives me a penny every time I see the bees swarm first. Papa lost one colony of bees this spring, but he did not lose any last winter. He extracts the most of his honey, because people like it better that way, and it sells more readily. Papa has divided six colonies.

LILLIE SPRACKLEN, age 14.

Cowden, Ill., June 3, 1889.

HOW FAR DO SWARMS FLY?

My brother has 40 hives. We have had a very long drouth. We had a good rain last night and this morning. The horsemint is in bloom. It was dying, but this rain will stop it. My brother has not had many swarms; but two ran away. Do you know how far a swarm flies? Mr. Stone, of Belton, was the first man that brought the Italians to this county. While increasing them a swarm ran away. A long time after, the swarm was found 14 miles from the apiary. No one knew the race of bees. Mr. Stone bought the swarm for \$5.00. My brother buys his supplies of you. He gets other bee-keepers to order with him, so as to make freight cheap.

I thought I would tell you about wild ducks. They build their nests in a hollow tree, and keep their eggs warm with down. They lay from 10 to 24 eggs. Their eggs are white, about the size of a pullet's egg. They prefer a tree that leans over the water to build a nest in. When the eggs are hatched, and the young ducks are about an hour old, the old duck takes them to the water. Then the drake helps to defend them. If any one comes near, the old hen will act as if she were crippled to get the one to take after her, then the drake will take the ducks to the bank and hide them. The young ducks are very wild. Before the young ducks are able to fly they dive under the water.

WM. MORGAN.

Belton, Texas, June 12, 1889.

A LETTER FROM A LITTLE BOY IN SCOTLAND.

My father has given me leave to write a letter. Did you ever get a letter from a boy in Scotland? Our farm is in a glen in the highlands of Inverness-shire. We are near the big hills; they are covered with heather. It grows as thick as grass, and is awfully bonnie. We like the heather. It is red and purple, and some white. Father says you have no heather in America. I thought it was in every place. I am sure father would send you some to plant. It has a bonnie wee flower. I will tell you about father's bees, if you like.

JOHN STOKES, age 8.

Balnastraid, Carrbridge, Scotland.

We are very glad to get your letter, friend Johnnie. Although we have had juvenile letters from almost all parts of the world, we do not recollect just now of having received one from Scotland. We should very much like to see the Scotch heather, which you say, in your very expressive Scotch, is "awfully bonnie." No, we have no heather

in America, but we have heard a great deal of the heather honey, and we have tasted some samples. We have white clover, however, which we are proud of. Let us hear from you again. We like to hear from the little boys and girls, especially those who live on the other side of the "big pond."

700 LBS. OF HONEY FROM A SINGLE COLONY, ETC.

My father said that to every boy who writes a letter to you, you send a book. My father keeps bees, and I keep bees myself. I handle them. I have two sisters. One runs away from the bees, and the other don't. My father took over 700 lbs. of honey from one hive one season. I boxed a swarm of bees when I was three years old, and I have five swarms. I sold a swarm for £1.75, and bought a tricycle.

FRED W., age 8.

Adelaide, South Australia.

Seven hundred pounds of honey and over has been produced from a single colony and its increase. Such enormous yields are very rare indeed; still, it is not impossible that your papa took that much. We should be glad to hear more about it. As you have a long season, those 700-pound yields probably are not as scarce as they are in America. We should be glad to hear from some of our subscribers, especially the little folks who live in this portion of the globe. In regard to "boxing," a swarm of bees (or hiving, I suppose you mean) when you were only *three years old*, that is a little hard to believe. Little boys have a memory that is not always reliable; and one peculiarity of their memory is, that a thing is always greater than the real fact.

BEE KEEPING IN MINNESOTA; SWARMING, ETC.

We live up away up here in Minnesota, where such bee-raising as we read about in your books is unknown. My father is an amateur bee-raiser. He has been a market-gardener for many years, and finally two years ago he thought he would keep bees in connection with his gardening. Two years ago he got two colonies, paying the sum of \$12.00 for them, and now we have ten colonies. As you wanted me to write the facts, here goes:

A year ago we wintered the bees in the outdoor cellar, and they wintered nicely. Last winter he dug a hole, with ventilation in the top, and buried them. But there were two weak colonies, and those they left in the cellar. My mother fed them honey, and they ate it all up. Then she bought patent syrup and fed them, and it killed every one. So do not any of your readers ever feed your bees on patent syrup.

Will any of your readers tell me why our colonies swarmed so early in the season when Mr. Levy has 60 colonies, and he hasn't had a new one this year? and another bee-man who has 50, and it is the same with him? But my father feels proud that he has had the first and only new colony in the neighborhood this year.

MISS EDNA SHAW.

Fountain, Minn., June 8, 1889.

We don't know what your patent syrup is; but we always recommend, for a winter food, granulated-sugar syrup. In regard to the swarming, perhaps your papa keeps stronger colonies, or perhaps your neighbors keep the swarming cells of their colonies cut out so as to discourage swarming.

TOBACCO COLUMN.

CONDITIONS UNDER WHICH WE GIVE SMOKERS TO PERSONS WHO STOP USING TOBACCO.

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to GLEANINGS. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco using, providing he give us his pledge that, if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to GLEANINGS, though we greatly prefer that he be one, because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

THE PIPESTEM STICKIN' OUT.

My friend, your pipe we can not see;
Hidden surely it must be;
For while you travel round about,
We see the stem a stickin' out.

Now, do you think it nice and wise
To burn your nose and smoke our eyes?
Then just you lug your pipe about,
And leave the stem a stickin' out.

And if you think you're doing right
To puff and smoke both day and night,
Just bear your pipe with you about,
And leave the stem a stickin' out.

Examples set to girls and boys,
Although they spoil their life-long joys,
And as you pass along the route,
Just leave your pipestem stickin' out.

Thus as you lead the youth along,
To practice what they know is wrong,
They see the sign you bear about;
It is your pipestem stickin' out.

At home, at church, or while abroad,
The people all with one accord,
With deaf'ning roar aloud may shout—
"We see your pipestem stickin' out."

Now, if you would disgust us all—
The old, the young, the large, the small,
Just lug your pipe around, and shout,
"Here! See my pipestem stickin' out."

Cedartown, Ga. J. M. H.

A neighbor of mine, through the influence of GLEANINGS, has decided to quit the use of tobacco. If you will send him a smoker I will be responsible. If he ever uses it again I will pay for it.

Anneville, Texas. G. H. REED.

One of my friends, Mr. Sievert Anderson, who has been a great smoker, has quit smoking, and says if you will send him a smoker to Newton, Benton Co., Oregon, he will quit; and if he ever smokes again he will pay you.

Newport, Oregon.

MRS. C. DIXON.

I promise to pay for the smoker should I ever use tobacco in any way again; if you will try me this once yet, I feel as if it would be the last time I should have to ask for human help.

Here is another who is no reader of GLEANINGS, but he says if you will send him a smoker he will pay 75 cts. for it if he ever uses tobacco again in any way. If he breaks his pledge I will see that he pays it. His name is Albert Sanders.

Fairfield, Pa.

J. A. KIME.

I inclose 70 cents to pay for a smoker for myself, and also 20 cents to pay postage on a smoker for George James. Having used tobacco for 20 years he says he will quit; and I promise, if he ever uses it again, to pay for the smoker if he deserves one.

Denver, Mo.

W. R. SMITH.

An old friend of mine, Mr. Crandall, who has used tobacco for many years, has quit using it. I have also quit, as I never used it very much. Now, if you think we are entitled to a smoker between us, please send it along; and if we ever use it again we will pay you the full amount.

L. W. WATTS.

Portland, Oregon.

HAS RESUMED THE USE OF TOBACCO, BUT PAYS FOR THE SMOKER.

GLEANINGS is always gladly received. Mr. Rolan Routen has fallen back to his tobacco, and sends you 70 cts. to pay for the smoker he got.

Henry, Tenn.

R. F. CARTER.

Thanks for the 70 cents, friend C.—not because it is so much money, but because it shows that your friend is honest and square. We hope he will try it again, however.

I wish to join your anti-tobacco company, and I want a smoker, and then I shall be a smoker no longer. I have been using tobacco, though not immoderately, for several years, and I know it is an injury. I agree to all the conditions, so put me upon the list.

J. M. AKER.

Smithville, Mo., Apr. 25.

Friend A., where do you draw the line between "moderate" and "immoderate"? If, as you say, you used it moderately, and yet suffered from it, is it not true that the use of tobacco to any extent is an abuse of it, as it is with liquor?

Under date of May 9, friend A. says:

The smoker came this evening. Thank you. My time to stop smoking and chewing has begun, and I think I can be faithful. I never chewed or smoked extravagantly, but I have been at it thirty years or more, though I have quit several times, sometimes a year or two, in that time.

J. M. AKER.

Smithville, Mo.

I think that any man, by reading GLEANINGS, will be a better man spiritually if not financially. I have been smoking tobacco 25 years, and Bro. Morrow (the bee-man) told me I was smoking too much; and if I would quit you would give me a smoker; and in case you send me one, if ever I use tobacco again I hereby promise to pay for the smoker. I did not do this for the mere value of the smoker, for I don't suppose that money would have hired me to do so; but I believe that morally it is wrong; and, God being my helper, I'll never do it again.

Washington, Ark.

H. B. TIMBERLAKE.

COMMENCES THE USE OF TOBACCO, BUT PAYS FOR THE SMOKER.

Mr. Ummel has been using tobacco again, and I send you one dollar to pay for a broken pledge. He does not use much, but I should like for him to leave it alone altogether. I have three boys and three girls, all under ten years of age. I should hate awfully if any of them should learn to use the vile stuff. I hate tobacco, and I will fight it as long as I live. Pray for us, dear friend; pray that my dear husband may see how wrong it is to use tobacco, and that he may have strength to leave it alone.

New Goshen, Ind.

MRS. JOSEPHINE UMMEL.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

MARKET-GARDENING IN JULY.

ONE of the venders of a recipe for making artificial honey once said, as a reason why people had better manufacture honey instead of having the bees gather it, that it required brains enough to run a cotton-factory, to produce honey successfully with an apiary of *beehives*. Well, may be he was not so far from right, so far as brains are concerned; although I believe it would take still more brains to humbug and defraud the public, and at the same time build up a profitable business. Well, I have been thinking, during this July, that it takes as much brains to run a market-garden successfully as to run an apiary; and it is right in the line of this matter of demand and supply that I spoke about last month. As an illustration: Last year we raised so many peas, and managed so awkwardly, that they ripened all at once, as it were, until nobody wanted to see another pea. Prices went away down, and beautiful stratagems would hardly bring enough to pay for picking and carrying around town. This year I thought I would profit by experience, and I did. Just as soon as one lot of peas was up, another lot was planted, or drilled in, rather, with a grain-drill. It is a great deal more trouble to get the drill out so many times, and drill only two rows or three, the length of the lot; but it does the business. This year we have not had a pea on the wagon that was old and hard. The reason is, that customers have been for six weeks calling for the peas a little faster than they ripened; and we have had \$2.00 a bushel for every peck we have sold, with the exception of a small portion of the first Alaskas. Now, my mistake was in not planting one row more when I did plant, so as to give our Medina people just enough. We could then have had good prices, and supplied all demand. It has been the same way with lettuce. During the last of June, we had great beautiful heads of Henderson's New York lettuce, about as solid and almost as large as cabbages. At 5 cents a pound it was very good business indeed. But we had too many of them *at once*. It did not run up to seed; but as we had so much wet weather the heads rotted at the center. When these great crisp heads of lettuce were just right, nobody would look at any other—not even the Grand Rapids. Several patches of lettuce that were grown with much care and pains, were never made any use of whatever. When the big-head lettuce, however, began rotting at the center, all other kinds began to shoot up seed; and in one week after having the market overstocked, we had no nice lettuce at all, and the price has gone up from 5 cents to 10 cents per pound. Now, to manage so as to have just enough of each and every product in the market-garden to supply the demand clear through the season the year round, is certainly a matter requiring much calculation and forethought. In fact, I should like to see the

man who could do it, even for a town of 2000 inhabitants, and make no mistake. It is just so with the plant-trade. This year we had a great quantity of tomatoes, and thousands are yet in the seed-bed, or, rather, where they were transplanted; but the late cabbages we did not get enough of, and lost quite a good many orders. The Jersey Wakefield was a little overdone. By the way, the finest and hardest heads of cabbage we had last year to winter over were the Jersey Wakefield and Winningstadt. They kept over winter, in fact, a great deal better than Flat Dutch, and cabbages of that sort. Last year we managed cabbages so as to have not only enough, but too many, and many of them burst and went to waste. We made sour-kraut of them, but the sour-kraut did not all sell. This season, as with the peas, we went to the other extreme. We have not had enough cabbages for the demand so far. The consequence is, we are still getting 5 cents a pound for choice hard heads of Jersey Wakefield, even now during the middle of July. We are so well pleased with friend March's strain of Jersey Wakefield that we planted some seeds the first of July. The plants are up nicely, and will be put in the field during the last of July. We expect these will make nice heads to winter over; and if the price in the spring is not well up, we shall try planting some of our own so as to raise our own seed.

We have had more trouble this summer than ever before, with early celery running up to seed. We thought at first the fault was in the seed, and were going to complain to Peter Henderson because his White Plume ran to seed more than it ever did before. But when the Boston Market, Self Blanching, Golden Dwarf, and, in fact, the whole of them, ran up to seed, instead of making celery, as they have former seasons, we decided that it was the fault of the season. If any reader of GLEANINGS has a strain of celery (it ought to be White Plume or Self Blanching) that is especially adapted for getting early celery so as to put it on the market in June, he would confer a favor on us by sending us samples. We usually have celery on the market during the last of June; but our customers have not had a bit so far at this date, July 9.

THE BEST EARLY STRAWBERRY.

I told you a month ago, that the one fact that the Jessie furnishes strawberries in every respect equal to the Sharpless, but a weak or ten days *earlier*, was of itself a sufficient reason for giving that variety prominence. Well, after our strawberries were all picked I happened to go out to that nice patch of Jessies that I told you about; and what do you think? Why, it was pretty well covered with berries, when there was not any other strawberry on the place, with one exception. These later Jessies are not so awkward in shape as those first ripening were. They are nice and round, red all over—excellent in flavor, and sold readily for two cents a quart more than the black raspberries. Now, this may be caused partly by the way in which this bed has been cared for. The runners were kept off, and

the furrows between the beds have carried off the surplus water from our tremendous heavy rains. Have others found the Jessie superior as a *late* berry, as well as an early one? I spoke of one exception; this is the Gandy. The first ripe berry I found was in July. They are of good shape, and it is in every respect a good berry; but the few plants we have did not bear much fruit; and may be very late strawberries never do yield as much as the early ones. It is also very slow in putting out runners—so much so that the price of plants ought to be pretty high if they will behave as our Gandies do.

EARLY ONIONS, TO BE SOLD IN BUNCHES.

For a number of years we have sold great quantities of bunch onions; but I have been in the habit of using good-sized sets for the purpose. Years ago I bought quite a lot of good-sized Yellow Danvers sets; in fact, they were onions too small to sell, taken from those raised in the field. The swamp garden was almost filled with these. Well, like the celery, "every last onion" put up a seed-stalk. We cut off the seed-stalk, but that did not work very well. The onions are tough, and it is a good deal of work to peel them, so as to make them nice and handsome. Now, one of the boys planted a single row of White Victoria, furnished by Burpee. These were planted ever so much too thick, and we were too busy to thin them out. One day our hotel wanted some small onions, without bulbs, to put in glasses. I suggested to the boys that they thin out the White Victorias. These filled the bill exactly, and went off readily at 5 cents a bunch. The bunches hardly weighed half a pound; while of large coarse onions we gave a whole pound for a nickel. Well, these White Victorias do not have to be peeled at all. Just pull them out of the bed by the handful, and they are as white as snow, after we rinse the dirt off. Just tie a string around a good handful, clip the tops off so as to make them look even, slice the long slim roots off with a knife, and they are ready for the table. They are put on the table in long glasses, the bottom part uppermost. One could raise these onions by the million, at very little expense; but, like the peas and other things, we want to sow a few at a time, and keep up the succession. By the way, the Silver King, White Victoria, and the White Pearl onions, are all of them greatly superior for market-gardening; but they must be pulled and sold as soon as they are fit. If you try to stow them away, or keep them, as you do Yellow Danvers, Extra Early Red, or even Silverskin, you will come to grief. They will *rot* in spite of you, if you do not use them when they are ready to be used.

Now, it is a complicated matter, and requires much judgment and care, to have things come along in succession so as to be just the proper age at the time wanted, at the same time having enough and not very much too many. But it is a pleasant exercise for the mind and also for the body, and I do believe that quite a large and profitable business can be built up in almost any town where one will go at it in the way I have indicated. You may say your folks won't

buy onions and lettuce in July and August; but I haven't a doubt but that I could show you your mistake in short meter. The goods must be presented to customers in attractive shape. During this hot weather we have wet cloths constantly over every basket. If you let the sun shine right down on your lettuce, onions, or even into the potatoes, just a little while, it makes them look unattractive, and they are not as nice for the table. We are located within half a mile of the center of our town; therefore the wagon seldom goes over a mile in any direction; and during berry time we have found it much better to make frequent trips back to the garden. We are now getting raspberries at the rate of six or eight bushels a day. We get 8 cents for black ones, and 13 for the red ones. By choosing the right varieties these can be made to ripen in succession so as to avoid having a great lot on hand all at once. We have decided to can them before we will sell them at a less price than six cents a quart. We have been obliged to can only 2 bushels yet, which was Saturday night. It is an excellent idea to be able to tell customers that you propose canning before you will go below a certain price. Thompson's Extra Early Red raspberry ripened a little after the middle of the strawberry yield. The Turner came next, and now Cuthbert is beginning to ripen. Shafer's Colossal ripens last, and holds on a long while. The Doolittles are our first black raspberry. The Gregg comes in just after the Doolittle begins to fail. Then come blackberries. The Early Harvest begins to ripen before raspberries are gone. The Snyder is the one we use for the great-est crop.

This year we keep accounts with our berry-pickers by means of a blackboard. It is hung on one of the shutters used for our cold-frames. When a child brings in a basket of berries, the foreman gives him credit on the blackboard, which is right before his eyes. If the foreman does not do it right, the child makes his complaint then and there, and it is clearly understood that, if the picker assents to the figures on the board, there is to be no more talk about mistakes or omissions. Every picker brings in his berries, and sees his credit put down. He also sees how many quarts his comrades are getting, compared with his own. If he is visiting or playing, instead of "tending to his knitting," the blackboard record points the finger of reproof at him. Sometimes the foreman pleasantly explains to the younger ones, "My young friend, the reason why you do not make as good a record as the others is because you have been telling too many stories." The foreman examines the work of every picker; sees that he does not get green ones, leaves, etc., and also insists on having the bushes picked clean. The temptation to pick green ones in order to get along fast is considerable; but once in a while a child has to be sent home for the rest of the day, because he persists in getting green berries. The blackboard is one of the kind that rolls up so it can be unhooked from its nail, and carried in at night, or when rain comes up.

July 10:—Did you ever! When we decided to can our raspberries if they would not bring 6 cts. a quart, we had more orders than we could fill at 7; then we came up to 8, and we had more orders than we could fill, even at 8. To-day we are charging 10 cts., and the berries do not ripen fast enough to supply the demand, even at this price. It seems to me here is a lesson, not only for berry-producers, but for honey-producers as well. Do not be in a hurry to sell your product, and do not make contracts very much ahead.

THE BUSH LIMA BEANS AT THIS DATE.

I told you, in our last issue, that the Minnesota lima beans were all climbing poles. Well, one or two of the Kumerles are now sending up strong shoots, away up into the air, twisting themselves about in a spiral fashion, as if they could do a good job of climbing if they had a chance. Well, they are going to have a chance. Last of all, quite a few of the Henderson bush limas are also sending out shoots to climb poles. Now, friends, let us not be in haste to say hard things about the seedsmen. A quarter of an acre of our white kidney beans that have for years behaved themselves exactly like a bush bean are sprawling all over the ground, almost exactly like a patch of pole beans. Is it possible that the exceedingly damp weather has started such a rampant growth that the beans are all turning out climbers, and the celery and onions are all sending up seed-stalks? It certainly looks a good deal that way.

OUR HOMES.

God hath put all things under Christ's feet, and gave him to be the head of all things over the church, which is his body, the fullness of him that filleth all in all.—Eph. 1: 22, 23.

WHY SHOULD I UNITE WITH THE CHURCH?

BEFORE taking up the subject indicated in our text, I wish to give you a glimpse of a letter just at hand. It is so perfect a supplement to the sermon, that it almost seems as if the two writers had been talking the matter over.

Mr. Root:—GLEANINGS for July is received, and I have just finished reading your article on "Love your Neighbors." I want to tell you how I tried to keep Mr. A. from subscribing to Bee Culture. While I was away, some one sent him a swarm of bees in a very old hive. He made two nice bives; and before he could get the bees in one he was taken sick. Knowing how much he thought of them, I took as good care of them as I could. When he was fully restored in mind, he began to be interested in his bees again. Now, you know we had lost every thing, and a dollar was as big to us as a "cart-wheel," especially as we had been to so much expense during his five months of sickness, and he still unable to attend to business.

I forgot to tell you in the start, that my husband was an ungodly man, and an unbeliever. As I said, he "got" interested in his bees, and nothing would do but he must send for frames, a smoker, etc. You, I believe, sent him a sample copy of GLEANINGS, so he must subscribe for that. I told him we

could not afford it, as the bees had cost him enough already. But he did, and the very first number was of untold value to us, especially for the article in "Myself and my Neighbors." It came right in the midst of a great revival. I had been unable to get Mr. A. out to preaching; but before the meetings were over he made a complete surrender to Christ, and is now an earnest worker in the cause. I do not think GLEANINGS comes half often enough for me. During the meetings there were a good many who could not see their way clear. GLEANINGS was handed around like a tract, or religious work, and was quite a help. I think the article in that especial number was, "Am I a Christian?" Would that all business could have Christ in it! I just felt drawn to you in Christian love on reading the article in the July number, and thought I must write and tell you how much I enjoy your paper, thinking it might be a help to you in writing for the August number. Now, Mr. A. has to go off for the summer. He will be in New York in July, August, and September, and I shall have the care and anxiety of the business as well as of the family, and I want your prayers that the Lord will be with me, and that I may be able to trust him fully to care for me. We had friends to help us in our trouble, and now I think we shall get on nicely. Please excuse this effusion, and *don't* let it fall into the hands of Blue Eyes, or the printers. Mrs. J. P. A.

You will notice in the above, that my good friend says, "Do not let this get into the hands of the printers;" but knowing how such encouraging words as hers incite us all to renewed efforts, I have taken the liberty of disobeying, giving the initials only. You will notice a reference in her letter to an article in GLEANINGS for May 15, entitled, "Am I a Christian?" This sermon was followed shortly after by another one, in substance covering the head of this talk to-day—"Why should I Unite with the Church?" I have been for some time thinking of giving this talk also; and the above letter, telling how it was passed around from one to another to read, has decided me to do so. I am the more glad to give it, because the matter has come up at different times among the readers of GLEANINGS, and I know there are quite a number who have had quite a bright experience to start with; and yet, by putting off uniting with the church, they finally begin to delude themselves with the idea that they can be just as good Christians without taking any public stand with the people of God.

And the Lord added to them day by day those that were being saved.—ACTS 2: 47 (R. V.).

The translation of the Revised Version is preferable here, because of its more accurate rendering of the closing words of the verse. The Authorized Version translates: "*Such as should be saved.*" But the term in the Greek is a *present participle* (*sodzomenous*), signifying, not future, but present attainment—"Those who were being saved," or, "Those who were getting themselves saved." There is another difference in the two Versions. The Authorized Version, upon the basis of the "Textus Receptus," translates, "And the Lord added to the church." But there is a difference of opinion whether the words *ta ekklesia*, "to the church," should be retained or not. They are sustained by good authority, and there is good authority for their rejection. But,

whether retained or not, the meaning is the same. This meaning can be most clearly set forth by a combination of the two translations, reading thus: "*And the Lord added to the church day by day those that were being saved.*" That is, as fast as men were converted, day by day, they were received publicly into the company of the disciples, who constituted the church of God.

We need to understand clearly, as the connection so plainly shows, that the *visible* church is here meant, and not the *invisible*. In the 41st verse we read: "And they that gladly received the word were baptized; and the same day there were added unto them about three thousand souls," clearly referring to the converts of the pentecostal revival, who were already members of the *invisible* church, and indicating their public reception, by baptism, into the *visible* church. It was to the company of the disciples, thus increased, that there were added, day by day from that time on, such as were being saved, and were thus made ready for reception into the visible church.

Upon the basis of this apostolic example, I wish to rear a superstructure of answers to the question: "*Why should those who consider themselves Christians unite with the visible church of God?*"

I. A first answer to this question is, *Because church-membership will help one on in the Christian life.*

In speaking with a young convert recently, I said to him: "Now you must join the church at the first opportunity." He replied, "Don't you think a person can be a Christian without joining the church?" A few days afterward while calling upon a lady, I remarked: "You are a church-member, I presume."

"No," she replied, with a toss of the head, "I am not."

"You have sometimes thought of your duty in this regard, have you not?" I asked.

"Oh! I consider myself to be a Christian, and have for a long time," she replied; "but I don't see what's the use of joining the church."

"Why not?"

"Because I can be just as good a Christian without, can't I?"

These are individual examples of opinion upon this subject that are more prevalent and popular than we are accustomed to think. After we have made due allowance for those who *will talk* and must say *something*, there are a large number who find a stumbling-block just at this point, and need to be carefully conducted around it, lest they fall by the way.

To this end, let us first answer the two questions that are asked above.

To the first, *whether one can not be a Christian without joining the church*, I would reply, I presume he can. I would not deny the *possibility* of the case, any more than I would deny the possibility of one's being loyal to his country, in war times, although he may fail to go to the front when men are needed there. Joining the church does not *make* one a Christian. It presupposes that he is *already* loyal to his Lord and Savior Jesus Christ. It does, however, *bring him to the front* in the Lord's warfare. Now, although there exists a *possibility* of a man's being a Christian without joining the church, yet I must confess that I never could understand how a man can be *loyal to Christ and not want to be at the front*, any more than I can under-

stand how a man can justly claim love to his country and loyalty to her cause, and yet hide in the woods to escape being drafted. It does seem, that if one is *really a Christian* he will *want* to come to the front and join the church.

In answer to the second question above, *whether one can not be as good a Christian without joining the church*, I would reply, *No!* Membership in Christ's church *helps us* in the Christian life. By means of her fellowship we get *stimulus* and *strength*. We thus bring ourselves into association with those who have the same cause at heart. It contributes to the increase of one's *zeal*. The sharp click of the flint against the steel produces the spark. Love to Christ, brought in contact with love to Christ, produces Christian zeal. If you try to keep a fire alive with a single stick it is almost sure to go out. If you want your spark of patriotism kindled into a flame, go to the front; join the company of those in actual service; drill with them; fight with them; join in the songs of victory; and you will conclude that you never knew what patriotism was before. Don't boast of loyalty to the Master's cause when you are drilling in the company of the stay-at-homes. Not only go to the front in the Master's service, and report for duty, but get a place in the fighting ranks. Join the advance guard, if you can. Those who are stationed in the rear are most apt to flee when the shot and shell fall thick and fast. In the onward march, the rear guard have the greatest temptations to become, first stragglers, next deserters, finally traitors. If a man is in the front ranks, it is next to impossible for him to desert, for he is so surrounded by the loyal and fighting host that he can't fall back, and must move forward. Other things being equal, have you any doubt who will make the better soldier and will accomplish most for his country's cause—the man who thus bravely goes to the front, or the man who holds back and urges every excuse for staying at home? Who, then, will make the better Christian, the one who joins the church—the advance guard of Christ's forces—or the one who does not? Can you not see that you would gain *help* in the Christian life, and would make a better soldier of the cross, if you joined the church of Christ? Especially if you feel your own *weakness*, and *lack of faith*, and need of Christian *help*, and have *any fears that you may not hold out* in the Christian life—you should then by all means join the church, and gain a place in the foremost ranks. Men have said, at the beginning of battle, "Now I am going to get awfully scared, and may try to run; but don't you let me. You're an old hand at it, and are sure to stand. Now just keep me in place and don't let me become a deserter." Just so, many a young soldier of Christ, when fearful and about to retreat, has been *kept in place* by the veterans who fought beside him and urged him on, when, if he had not stationed himself there he would have yielded and fled from the field disgraced. If one loiters in the *rear*, who is there *behind* him to urge him on? We must not spend our time picking out trees behind which we are going to dodge in case we are defeated. Armies sometimes spare a fort they have captured, because it will make a good place of refuge in case they have to retreat. But the Christian soldier has no business to plan for failure. He should rather burn the bridges behind him, and thus render it impossible to retreat. Talk of *backsliding*! You can't *slide*

back unless there is an inclination in the backward direction. Join the church, place yourself in the front ranks, stand beside the veteran in Christ's service, and you will find it a wonderful stimulus and help in the Christian life.

II. Another answer to the question why you should join the church if you consider yourself a Christian is, *Because you thus identify yourself with the instrumentalities God has ordained for the advancement of his cause on earth.* There can be no question that Christ planned the establishment of the church, and that he ordained it to be the center of all activity and endeavor for the advancement of his cause. He said to Peter: "Upon this rock I will build my church" (Matt. 16: 18), thus promising an institution the basis of which should be a confession in him as the Son of God. He commanded regarding an offending brother, brought before two or three witnesses: "If he shall neglect to hear them, tell it unto the church; and if he shall neglect to hear the church, let him be unto thee as a heathen man and a publican" (Matt. 18: 17)—thus providing for a visible church which should judge whether a man were a true member of the invisible church. The company of the disciples whom Christ gathered around him were the nucleus of the church that was to be established by Christ, through the Spirit, at the season of pentecost, from which time on those who were converted were further added by the Lord unto the church. The invisible church is the true church, cleansed and purified and sanctified, and therefore it can not be to this but to the visible church, that Paul refers when he says that "Christ loved the church, and gave himself for it; that he might sanctify and cleanse it with the washing of water by the word, that he might present it to himself a glorious church, not having spot or wrinkle or any such thing; but that it should be holy and without blemish" (Eph. 5: 25—27). It is quite popular to say that Christ did not institute the church; but, like a great many things that are popular, it is very far from the truth. The church is the recognized means for the advancement of the kingdom of Christ. It was his disciples whom he commanded: "Go ye into all the world and preach the gospel to every creature." The visible church is the organized army of Christ. It is our place, if we would do our noblest for Christ, to be found in it. It may have unworthy members; there may be found within it enemies and traitors and spies; but that is no reason why we should not be found there. So much the more reason why we should join the ranks and counteract the influence of these who profess to be Christ's and are not. What would have been thought of a man who, in our nation's last great contest, should have said: "Why, yes! I am in favor of the Northern cause, and opposed to secession and slavery. I believe the former should be put down, and the latter abolished. But I think I can do more good in the army of the South than I can in the army of the North. I will serve there, and try to win men to the Northern cause. I will persuade them to desert, and join the Northern army. I can do more good by going among them as though I were one of them. I will find out their plans, discover their strongholds, and report them to the other side"—would not one of two things be true—either such a man would not be looked upon as loyal to the North, and his words would have no effect in winning men from the South, or he would be considered a spy, and the

enemy would carefully conceal their plans from him, and he himself would be cast out? Those who claim to be Christ's, and yet march with the world, upon the plea of the greater good they can do, will meet with similar results. Men of the world will say of them: "When they talk to us of joining the army of Christ, they don't mean what they say; for do you suppose that, if they were loyal to Christ, we should find them in our ranks? Not by any means!" Or they would say, "These men are spies. They are working for the other side, and are among us only to find out our plans and discover our strongholds. We must look out and conceal our purposes from them." In either case, those who would influence the world by marching in their ranks, fail of their purpose. Either their sincerity is called in question, or they are thwarted because their true purpose is suspected. Either men will distrust them or they will not confide in them. Christ may want spies to spy out the land, but he will choose them from his own ranks, and not from those who are marching with the enemy. If you would do something for Christ that is worth doing, join his regular standing army, and get your commission for service there. There is advantage in guerilla warfare when it is directed by the general in command, but otherwise it may do more harm than good. If you would accomplish your best work for Christ you must join the visible church of Christ.

III. Another answer to the question why one should join the church is, *Because by that means alone can we let our lights properly shine for Christ.* A gentleman said to me, "I call myself a Christian; I try to throw my influence on the side of right—what more is to be accomplished by joining the church?" The gain is, that until one joins the church the influence of his life can not be said to be all on the side of Christ. For example, I know a man of upright life, honest and moral, who called himself a Christian, who wanted to do all he could for Christ, who nevertheless had not seen his way clear to join the church. He thought that he was doing all the good he could, and was influencing other lives for Christ. I discovered a far different state of affairs. I found that unconverted men were pointing to him as their example and excuse. They were saying of him, "There's the man I pattern after. If he can be as good a man as he is without religion, I'm willing to take my chances." That man was letting his light shine before the world, but he was not letting it shine for Christ. He was in reality against Christ instead of for him. He was not setting up a righteousness of his own, but he was leading men to think he was, and so was exerting an influence against the Master's cause. The enemy were counting him on their side, when he counted himself on the other side, and all because he did not come out and unite with the church and proclaim where he stood. It was for self and Satan that his light shone, and not for Christ. Christ says, "Let your light so shine before men that they may see your good works and glorify not you, but glorify—YOUR FATHER WHICH IS IN HEAVEN." No matter how large and glaring a watch-fire you may build, and no matter what your purpose may be in building it, if you build it in the enemy's camp it shines to their advantage, and to the disadvantage of the forces of truth and righteousness. If you would make sure to cast no uncertain ray of light, you must at once pitch your

tent among the loyal forces of Christ, otherwise you may *mislead* men rather than *save* them. If you are going to build a fire upon the shore, so that some lone fisherman, lost in the darkness upon the sea, will be attracted by it and steer toward it, it makes all the difference in the world where you locate it. You may think that you know a *better* spot to place it than that where it is usually built—it may be a *loftier* place, and the glare of the fire may reach out *further* across the sea—yet *how do you know* but that in steering for that point the vessel may be dashed to pieces upon the hidden rocks, while the path of the sea is *clear* to the other point? If hundreds of fishermen have been guided aright by the light when stationed at the accustomed place, is it not wiser to build there than to risk the dangers of another and an untried point? The church is the *lighthouse* of God. If you have a brilliant light place it *there*, and not upon another rock, or you are almost sure to mislead the seaman who is seeking guidance to the harbor of peace.

IV. Still another answer why, if we are Christians, we should join the church, is, *Because it's our plain duty, Christ has commanded it*; and when Christ commands, there can be no question as to what is right. Do you ask a place in the Bible where he commands it? Turn to Matt. 28:19. There you read: "Go ye therefore, and teach all nations, baptizing them;" or, "make disciples of all nations, baptizing them." The followers of Christ are commanded to "disciple," or "convert," all nations; but they are just as plainly and emphatically commanded to "baptize" them. Both obligations are placed upon them. Now, if it was the duty of the disciples to baptize their converts, inversely it was the duty of the converts to be baptized. Read this same command as given in Mark 16:15, 16: "Go ye into all the world, and preach the gospel to every creature. He that believeth and is baptized shall be saved." We hold, of course, that those who believe and die without the opportunity of being baptized, are saved; but who can doubt, from these passages, that it is the duty of those who believe, to be baptized? Now, what is baptism, objectively, but the mark of reception into the visible church? The command, then, to be baptized, is identical with the command to join the church.

Take into consideration another passage: Paul, in the words of the institution of the Lord's supper, quotes from Christ the command: "This do in remembrance of me" (I. Cor. 11:25). Every disciple of Christ is directed to "show forth the Lord's death" by participating in the celebration of the Lord's supper. Now, there are many who believe that none should partake of the Lord's supper unless they have first become members of the visible church of Christ. That is my belief. The sacraments of the church should be confined to the members of the church. Especially if one neglects or despises church-membership, I doubt if he has a right to this sacrament which Christ instituted for a remembrance of himself. How, then, can one obey Christ's command to thus "show forth his death" unless he joins the church? He is simply living in disobedience to one of Christ's plainest commands. Still another passage demands our consideration. In Matt. 10:32, 33, we find the words of Christ: "Whosoever, therefore, shall confess me before men, him will I confess also before my Father which is in heaven. But whosoever shall deny me before men, him will I also deny before my Fa-

ther which is in heaven." Who, after reading those words, can dare to hope that Christ will confess us before the Father if we do not confess him before men?

"But," you say, "I confess Christ with the life, and not with the mouth—actions speak louder than words."

So far, so good. We don't want the mouth-confession without the life-confession, to be sure; but Christ wants both. In this plain passage, we have no right to read different meanings into the word "confess," according as it is applied to *ourselves* or to Christ. When Christ says, "Him will I confess before my Father," he means a confession of the mouth. So when he says, "Whosoever shall confess me before men," he likewise must mean a confession of the mouth. If we expect that Christ will say of us, before the hosts of heaven, at the last day, "This is my child," we must say of him now, before men, "This is my Savior."

Now we are ready to read that wonderful passage in Rom. 10:9, 10, and read it understandingly: "If thou shalt confess with thy mouth the name of the Lord Jesus, and shalt believe in thine heart that God hath raised him from the dead, thou shalt be saved. For with the heart man believeth, but with the mouth confession is made unto salvation." You can fully obey the commands of Christ only by coming out boldly before the world and joining the church on confession of your faith in Christ. To confess Christ by the daily life, to speak a word for him in private, to take an occasional part in the service of prayer—all this is excellent, but not sufficient. If we would be partakers of the full and free salvation of Christ, we must make the freest and fullest confession of him, before the world, that it is possible for us to make; and to this end we must be added unto the church with those that are being saved. Thus does it become us, in imitation of Christ, to fulfill all righteousness.

The answers to be given to the question, "Why should those who call themselves Christians join the church?" are thus seen to be:

First, because the church-membership helps one on in the Christian life.

Second, because one thus identifies himself with the means God has ordained for the advancement of his cause.

Third, because thus alone can one let his light fully shine for Christ.

Fourth, because it is a plain duty, Christ having commanded it.

These answers should come with convincing force to three classes:

First, to those who have just started in Christ's service. Shall such join the church? By all means! Where else could they go? Where shall the prodigal return but to the father's house? Where shall the reclaimed lamb be taken but back to the fold from which it had wandered, and there be safely sheltered within? If left without, it is almost sure to wander away again. Some question whether it would not be better for them to wait awhile, to see whether they will persevere in their Christian lives. Emphatically, No! That is planning for defeat. Leave the lamb without the fold over night to see if it is inclined to run away again? Others think that they will delay until they feel more worthy to come. If they wait for that, we hope and believe that they will never come. We never want to feel

worthy of joining the church. It is not that *we* are worthy, but that *Christ* who died is worthy, and we come in his name. We do not profess to be *sinless*, but *sinners saved through Christ*. If there is in the heart a godly sorrow for the past, a sense of sin forgiven, and a firm determination to serve Christ in the future, then you should come at the *first opportunity* and offer yourself for reception into the church of Christ. It is *always a mistake to wait*. Your duty is clear. "This do"—and there can never be any good excuse for the neglect of a plain duty. It is your duty to join the church, and the first opportunity is the Lord's time for the performance of that duty.

Second, to *Christians in disguise*, sometimes self-styled "*secret Christians*." Yet what a *secret Christian* is, I hardly know. Christ says: "No man, when he hath lighted a candle, covereth it with a vessel, or putteth it under a bed; but setteth it on a candlestick, that they which enter in may see the light" (Luke 8 : 16). What can be the *object* of having the light of a Christian hope lighted within the heart, and then covering it up so that no man can see the light? Is it because *ashamed* of Christ that such as these sometimes conceal the light? "Who-soever shall be ashamed of me and of my words in this adulterous and sinful generation," says Christ, "of him shall the Son of man be ashamed when he cometh in the glory of his Father with the holy angels" (Mark 8:38). How can a man be Christ's and not want others to know it? One would think that he would want to proclaim it to all the world, if really and truly a "child of the king." Such as are engaged in seeking a place in which to hide their light, either never were Christ's, or have ceased to be Christ's, or will soon no longer be Christ's. Hiding a light beneath a bushel not only keeps it from shining, but also causes it to grow dim, and at length to go out. You must place your lamp upon the high stand of a public confession of Christ, if you would have it truly shine for him.

Third, to *lapsed members*. How many there are, who were once church-members, who now are not! Ask them whether they are members of the church, and they will answer that they are. In reality they are *lapsed* members. This comes about in various ways. Many change their residence, and fail to take a letter of dismissal with them, because, as they say, they "expect to go back some time." Thus they are classed as "absent members," and at length their names are stricken from the list. Church-membership amounts to nothing after one has been absent a year or two. Few churches would count such an absentee a member at all. Others go to another place to reside, expecting to stay, and take a church-letter with them, but neglect to present it to any local church. Such can be classed, if at all, simply "pocket members," or "bureau-drawer members." They are placing a "pocket veto" upon the law of church-membership enacted by Christ. There are people in every community who are in reality Christians, who are ranked as "non-Christian" because they have failed to unite with any local church, and thus let people know where they stand. It is just as much our duty to *keep up* our membership in the church of Christ as it is our duty at the first to *join* the church of Christ. Neglect of this duty is the first step toward carelessness in the discharge of other Christian duties, and indifference toward the interest of Christ's cause in the community where we dwell.

I have thus plainly presented the reasons why, if you are a Christian, you should be a member of Christ's church. I beseech you to weigh them, and not to dismiss them from your mind, as you value your soul and love Christ's cause, till you have *seen your duty clearly in this regard*. Behold the truth as it is. Pray God for guidance. Determine that you will fully confess Christ before the world, and thus become a part of the church which he loved, and for which he gave himself, that he might sanctify and cleanse it, and at length present it unto himself without blemish. And the God of all peace abide with you evermore. Amen.

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

SWARMING, FOUNTAIN PUMP, ETC.

DURING the last week or ten days we have been having an unusual amount of swarming. Beginning with the 4th of July, the weather, instead of being stormy, has been fair, and every thing has been favorable for the secretion of nectar. Honey has been coming in at a faster rate than we have seen it before for several years. We have had an average of about seven swarms a day, and Sunday has been no exception. Mr. Spafford had about all he could do to take care of the apiary, and fill orders for bees and queens, to say nothing about bothering with swarms. Your humble servant has been obliged more than once to leave matter for GLEANINGS heaped up on his desk, and go out to the apiary to help Mr. Spafford. Sometimes we had three or four swarms in the air at one time. One day after I had waited half an hour, or twenty minutes, for a swarm to cluster, and still they were flying around without showing any disposition to settle, I became disgusted. The fountain pump had been recommended, but heretofore we had never given it a trial, although good bee-keepers like James Heddon and others had recommended its use. A pail of water and a fountain pump were procured. "Now," thought I, "we will see whether you'll settle or not." After quickly adjusting the spray nozzle, I began pumping the spray among them where they were flying thickest. Sure enough, it had the desired effect. After about half a pail of water had been thrown, some of the bees began to settle on the grapevines. When the entire contents of the pail were exhausted, there was a decided settling on the part of the bees. Laying down the Whitman pump I grasped the Manum swarming-arrangement (which is always in sight), jarred the bees into the basket, and had the satisfaction, in a few minutes more, of seeing the cluster hanging from the basket.

On another occasion two swarms came out almost simultaneously, from hives remote from each other. As the bees from each soared into the air, I perceived that they were gradually circling together. "Now," thought I, "I will see if I can not separate you, or, rather, prevent you from ever getting together." I began spraying the outer edges of the flying bees of the

swarm in the air, nearest to me. Those bees receiving the spray began to retreat very perceptibly. I followed up my advantage until I had them driven quite a little distance away. The other swarm, in the meantime, was coming up. I began dousing them in a similar manner, and soon had the satisfaction of seeing them retreat. Each was then sprayed, when they were hived, as before explained.

Last Sunday, the 7th, before I had a chance to get my breakfast, a swarm was out. Before I had got them fairly hived, another swarm came out. I was about to hive these, when Mr. Calvert (my brother-in-law) came to spell me. It had been previously arranged that I was to take care of the bees in the forenoon, and our Mr. Spafford in the afternoon. Some three or four swarms had come out during the morning. After breakfast I relieved Mr. Calvert, and, with lesson-helps in hand, I perched myself under the shady veranda of the house-apary, in full view of every colony in the yard. As I studied about Samuel, my eyes now and then took in a survey of the apiary. Fortunately the bees behaved themselves for a full hour. When church was out, Mr. Spafford relieved me. On returning from Sunday-school we found some swarms had come out, and that one was already in the air. This one seemed determined to alight upon the top of an evergreen-tree. Now, none of us relished the idea of climbing this tree, with our nice Sunday clothes on. Accordingly, I removed the spray nozzle of the Whitman fountain pump, and screwed on the stream nozzle. Although the bees had formed quite a little cluster, I felt pretty sure that I could dislodge them. I began to shoot a solid jet of water directly at them. This had the effect of stopping the bees from clustering there any further, as well as having the other effect of dislodging some of those that were already on. I could not dislodge the latter entirely, and left them, as I noticed that the rest of the swarm seemed to think this was not a desirable place, dripping as it was with great drops of water. They started to cluster upon another spot, not exactly an accessible one. The stream nozzle was directed at them as before. Again they took another position, and very soon we had a nice cone of bees hanging where we could reach them easily with the Manum swarming-basket. After about half the bees had settled, the cluster was jarred into the basket, which was then closed. The tripod was then adjusted, and soon we had the satisfaction of seeing the swarm hanging right from the swarming-basket instead of from the top of the evergreen.

Besides the facility with which a swarm may be induced to settle by the use of the fountain-pump, and besides the other advantage of dislodging them from an almost inaccessible position, it may be used to very good advantage in preventing bees from clustering upon their former point of attachment; that is, the place where they had previously been clustering. After shaking the bees into the Manum basket, there is always about half of the bees that persist in

clinging to the old limb. I found that, by dousing it thoroughly with water, the bees will let it alone entirely, and soon cluster on the basket, just where they are wanted.

DRIVING A SWARM IN THE AIR LIKE A FLOCK OF SHEEP.

The feature of being able to drive a swarm like a flock of sheep is a valuable one. Some of you may doubt this; but I assure you I have been successful thus far in driving and cornering up whatever swarm I experimented upon. This morning a swarm of some eight or ten pounds of bees was making straight for a hickory-tree on the outside of the apiary. This tree is some forty or fifty feet tall. I hallooed to Fred, a new hand in the business, to run around them and head them off with the fountain pump. He did so, and it made me feel—well, *real good* to see them halt, then retreat before the spray and finally settle where we wanted them to. Another swarm started to leave the premises, evidently with the full determination of making straight for the woods. The fountain pump was on hand, and, as before, we made those truant bees turn right about face, and finally to settle down upon a low grapevine. Perhaps I should state right here, that two or three days before we commenced using the fountain pump, we had one swarm that actually absconded. One of our boys chased after them until he came to some swampy land, when he had to stop and see them go off.

The timely and skillful use of the fountain pump, I think, would keep almost all the swarms from going outside of the premises of the apiarist. All he has to do is to head them off, and keep spraying them until they conclude they will *have* to settle. The effect of the spraying not only impedes the flight of the bees by dampening their wings, but it may have the effect of making them think that it is raining, and that they had better put aside their purpose. After spraying the bees for some time, I have seen them become so tired, evidently, that they would drop down from exhaustion. With their fore legs they would rub their eyes; with their middle legs they would rub the thorax, and with their hind legs they would dry their wings. It is a little amusing to see them brush themselves up after a good dousing.

Sometimes it is not advisable to use a fountain pump. Just as soon as a few bees show a disposition to cluster upon any particular place, we cease from forcing water upon them, unless, perchance, some other bees are trying to establish another location for a cluster more inaccessible. Again, with a very strong swarm I find that it takes a very large amount of spraying to have any effect upon them.

THE SMITH PUMP NOT SUITABLE.

I have tried our cheap dollar pump, but it won't answer at all for spraying swarms, although it will do very well for garden purposes.

THE FOUNTAIN PUMP, AND CLIPPING QUEENS' WINGS.

The use of the fountain pump might be

largely if not altogether dispensed with if we clipped our queens' wings. Swarms could then be hived in exactly the same manner as A. E. Manum described and illustrated a year ago. Still, a great many times a swarm will come out with a virgin queen. It is then that the fountain pump with two or three uses will pay for itself. Were it not for the fact of our filling orders, and the preferences of our different customers, I do not know but I should be in favor of clipping queens' wings here at the Home of the Honey-bees. One colony having a valuable imported queen, swarmed out. We made them come down, secured them in the basket, and hived them on foundation with a frame of unsealed brood to hold them. The next day a number of swarms came out; and as several came out simultaneously it was impossible to locate the source of each one. Toward the close of the day, when we examined the recently hived swarm with the imported queen above mentioned, I found that they had decamped, leaving only a few hundred bees to take care of the frame of brood. That they were somewhere in the apiary, and had been hived, I had no doubt; but where, was the question. If her wings had been clipped, we could have secured the swarm by itself.

HIVING UPON UNSEALED BROOD.

Out of some 35 or 40 swarms which we have hived during the last few days, as nearly as we can make out some 7 or 8 of this number have actually left their frames of unsealed larvæ. While a frame of brood tends very greatly to hold the swarm, it is by no means infallible.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, JULY 15, 1889.

I had rather be a doorkeeper in the house of my God than to dwell in the tents of wickedness. PSALM 84: 10.

BUSINESS UP TO DATE.

We are still having quite a run of business, and it is approaching the middle of July. Orders usually begin to slacken up about the first of this month. We expect to be entirely caught up in a day or so.

MORE IMPROVEMENTS AT THE HOME OF THE HONEY BEES.

WELL, we have not got to tear down our barns and build greater, exactly, but we are obliged to add more boiler capacity. We are now making preparations to tear down our 60-foot chimney, and build in its stead another one 80 feet tall, 38 inches in diameter inside, with an 8-ft. base. We expect to add another boiler, alongside of our old one, to

give us a boiler capacity of 120 horse-power. Our business has been such that our 60 horse boiler has hardly been adequate to keep the machinery moving at full speed.

THE POULTRY DEPARTMENT OF THE CANADIAN BEE JOURNAL.

We have for a long time wanted to congratulate the *Canadian Bee Journal* on securing the services of so competent a person as W. C. G. Peters as poultry editor. He is full of the subject, and his editorials show that he has had a great deal of practical experience.

THE SEASON IN AUSTRALIA.

WHILE we bee-keepers of the Northern States are enjoying a good honey-flow, and some hot weather, the bee-keepers of Australia are now fairly into winter. The *Australian Bee Journal* for June 1, 1889, says: "We are now fairly into winter; and if the instructions given previously have been carried out, the colonies should be in good condition to withstand the cold and damp to be expected during the next month or two." This does not sound much like our weather here, does it? Seasonable hints for Australia would hardly be seasonable for the United States.

THE HONEY-FLOW AT THIS DATE.

HERE it is July 12, and the honey is still coming in at a good rate, but basswood has not begun to yield to any extent yet. In fact, it is doubtful whether it will yield at all in our locality. In the basswood orchard, some two miles to the north of the Home of the Honey-bees, there is only about one tree that has even buds on, out of the 4000, so our basswood orchard probably will not yield any great amount of nectar this year. As nearly as we can discover along the roads, there are very few basswoods out anywhere. Evidently it is one of the off-years for this favored tree of the bee-keeper. *Later.*—Honey is coming in some from basswood after all.

OFF FOR WISCONSIN.

THE senior editor started for Wisconsin, Thursday, July 11. Blue Eyes accompanies him as far as Chicago, whence she takes the steamer for Manistee, Mich., where she will visit relatives. From Chicago, A. I. Root will go to Dr. C. C. Miller's, in Marengo, Ill., and thence he proceeds further to the northwest to that great basswood belt in Richland Co., Wis. Basswood is expected to be at its height about the time he will arrive there, which will be about the 15th or 16th. He has taken along with him a little Kodak camera, to take views of apiaries, gardens, etc. He was given full instructions how to "shoot it off," and it is expected that he will write up this trip, and perhaps illustrate it in the forthcoming issues of GLEANINGS.

SOMETHING FOR OUR GERMAN BEE-FRIENDS.

WE have just received from C. J. H. Gravenhorst a little work in the German language, called the "Bee-keeper's Album." It contains 51 pages of matter devoted to biographical sketches of some of the leading lights in apicultural science; namely, Dzierzon, Langstroth, Baron Berlepsch, Pastor Schonfeld, Hruschka, Mehring, Baron Ehrenfels, Kanitz, Louis Huber, Weygandt, Cowan, and Sartori. Elegant portraits of all those men are given in the highest style of the engraver's art. Many fine cuts of hives, apiaries, etc., are also given. As the present work is No. 1, we presume that friend Gravenhorst is going to publish at stated intervals

more of a similar character. We trust that such is the case; for although the language is foreign to us, the pictures are readily translated into any tongue desired. The price is, we understand, 50 pfennig, or half a mark—which would be equivalent to 12 cents. The paper and printing are of the very best. We cordially recommend the work to all who can read German. The book is $7\frac{1}{2} \times 6\frac{1}{2}$ inches.

MAKE ALL YOU CAN OF THE FAIRS.

OUR experience last fall at the Ohio Centennial at Columbus has taught us that much can be done at fairs toward educating the people in our favorite pursuit, and correcting many of the false ideas current among them. Much can be done toward correcting the public mind on the subject of manufactured (?) honey by distributing our \$1000 reward cards, and by having a comb-foundation mill, with samples of wax sheets before and after they have passed through the mill. The worst falsehoods are those which contain a grain of truth, and there is no doubt but that the comb-foundation industry furnishes a foundation and gives strength to the story of manufactured comb honey. In the minds of the great mass of the people, except those directly interested in the use of comb foundation, this product has made a vague impression, and it is not strange, knowing human nature as we do, that this foundation is exaggerated into fully completed comb, and filled with honey or a substitute. One of the best ways to correct the false notions, and shear off the great overgrowth of imagination from the facts is to show to the masses at the fairs how comb foundation is made, explaining the impossibility of accomplishing the manufacture of complete comb honey. Have a piece of natural comb and a piece of the thinnest comb foundation and a magnifying-glass, so that each may be examined. Hand to the skeptical and unbelieving one of our reward cards, offering \$1000 for proof to the contrary of your statements. In all your efforts, be patient and Christlike, remembering that these neighbors who have been misinformed have not had your opportunities for knowing the facts. If this policy is persistently carried out there can not fail to come increased confidence in bee-keepers as a class and their product, and increased consumption of honey.

THE PARIS EXPOSITION, AND THE UNITED STATES HONEY EXHIBIT.

The Paris correspondent of the *British Bee Journal*, under date of June 27, says:

The United States have a very considerable exhibit, contributed by nearly all the leading makers in the States, and shown as a joint collection. It is arranged on a floor-space of about 30 ft. long by 4 feet wide, and on the walls above are various small articles; also the well-known diagrams by Mr. Cheshire, of the British Bee-keepers' Association.

In regard to our own exhibit, he continues:

Mr. A. I. Root, of Medina, O., of course is to the fore. He shows his well-known lawn hive, his two-story hive, and his $1\frac{1}{2}$ -story hive. These are so well known as to need no further comment. There is also one of his latest natural-based foundation-machines, and a large can for catching the wax cappings when extracting is done on a large scale, as it is in the States,

Of W. T. Falconer's exhibit he says:

Every thing is got up in splendid style, and is clear varnished.

The world-wide word "Chautauqua," as applied to Falconer's hive, is disguised by the printers, doubtless, under the name "Chantangua."

Of the sections made by G. B. Lewis & Co., of Watertown, Wis., the correspondent says:

For an article that is produced by the million, they can not be surpassed.

Dr. Tinker's perforated zinc is very much admired, and the writer is very anxious to know where the doctor gets such perfect zinc. Why, he makes it himself, at his home in New Philadelphia, O. Of Dadant & Son's foundation the writer says:

It is so thin and clear that their name, which is printed on paper, and placed behind the foundation, shows plainly, and can be read easily through it.

The honey show itself is pronounced as nothing remarkable. Some of the honey was broken in shipping. "There is not really," it is said, "a well-finished section in the whole lot." The writer closes up by saying:

The inscription on top of the large stand is in letters constructed out of four-piece sections, and is very pretty, and in good taste. It reads thus: "Les insectes nuisibles et utiles," and the remaining three glass cases are filled with the specimens of the useful and harmful insects of the United States.

THE ST. JOSEPH EXPOSITION.

ONE of our subscribers, Mr. Thos. B. Nichol, of St. Joseph, Mo., forwards us some of the advance proofs of the premium-list of the St. Joseph, or, as it is called, the New Era Exposition. In looking down over the rules and regulations we note the following:

It has been urged by those responsible for the financial success of the exposition, that unless the horse-jockey had a chance at a purse of thousands of dollars, while the farmer competed for premiums of from fifty cents to five dollars, the exposition could not be sustained.

The New Era Exposition will try the experiment of reversing the order of things, relying on the agriculturists (who have hitherto loudly and justly complained) for an appreciation of efforts and a hearty co-operation.

This we believe is a step in the right direction; and the sooner the managers of our expositions begin to see it, the better it will be for them financially. The premiums offered on comb and extracted honey, bees and queens, in the Bees and Honey department, are some of the largest we have ever seen. No. 21, display of comb honey, largest and most attractive, first premium, \$50.00; second, \$25.00; No. 22, display of extracted honey, largest and most attractive, first premium, \$50.00; second, \$25.00. No wonder that the St. Joseph folks can afford to offer more for farm products when the horse-jockey is made to take a back seat. Instead of getting his thousand or two thousand dollars, he must be content with his proportion if he gets any at all. Let us take a case in point: The Buffalo International premium-list is at hand. While they offer quite a number of premiums of \$600, \$400, \$300, \$200, and so on, for single horses, the premiums on regular farm produce scarcely ever go beyond 10 or 20 dollars. The Buffalo Exposition alone offers something over \$11,000 in premiums for blooded horses alone. The same exposition offers about as many hundreds for the products of the soil. Perhaps we should mention that the Buffalo International Fair, to be held Sept. 3-13, offers very liberal premiums in the apiarian department—something like \$450. For comb and extracted honey there are two \$30.00 premiums—a number of \$15.00 and \$10.00 premiums. But they offer only a silver medal for apiarian supplies. Guess we won't exhibit this year. Mr. O. L. Hershisser, formerly a student at Lansing, Mich., under Prof. A. J. Cook, has charge of the department.

DON'T SELL TOO CHEAP.

The following very reasonable note came to hand just as we go to press. Those who have honey to sell had better bear in mind friend Heddon's suggestions.

Pleased at the partial improvements upon the past two seasons, many bee-keepers have been praising 1889 as a honey year. It begins to look plain to me that taking the country all over, we are not going to have an average crop by considerable. The past two poor seasons have cleared the market of honey, and got consumers into the habit of paying better prices than formerly. As it is a fact that we need it to keep our business equally profitable with other lines, let us hold up to this price. In this location the season's not as good, up to this date, as within the past two very poor years. We have not one-sixth of a crop. Basswood is in full bloom, fully half past, and not any thing like an average yield so far. Clover bloomed profusely, but yielded very stingily. This end of the white-honey crop. Pleurisy is not yet plentiful enough here to produce surplus honey to much extent in so large apiaries as I keep. It is just getting into bloom, and the bees are thick upon it, while they leave every other plant except that, for the basswood. We can see the honey standing in the jars some in little drops, and the bees crawling all over it, rapidly loading and going home. Only a few years ago we could not find a dozen plants within the radius of our apiaries. In a few years more we expect it to yield us a good surplus crop, if nothing unforeseen happens. Do not be in a hurry to dispose of your honey. Whatever you do sell early, do not sell it cheap. Let us wait till we see that we have to.

Dowagiac, Mich., July 13.

JAMES HEDDON.

SPECIAL NOTICES.

DECLINE IN BEESWAX.

We quote a decline of 2 cts. per lb. in price of wax from that last quoted. Revised prices will be 23 cts. cash; 26 cts. in trade for average wax, delivered here. To those who wish to buy, the price will be 28 cts. for average quality, and 32 for best selected. If those who send us wax would put their name and address on the package, or on a slip of paper in the package, so we could have a clew as to where it comes from, it would save us much trouble and annoyance.

A DROP IN THE PRICE OF THE WHITMAN PUMP.

We have received lower prices from the manufacturers of this excellent article, the merits of which are set forth in Our Own Apiary. It is only fair that we give our customers the advantage of the decline. Our catalogue price is \$7.50. We will now offer them for \$6.00 each; in lots of 3, for \$5.50 each. For larger quantities, write for prices. They may be sent by mail for 60 cts. each extra. Our old price was \$7.50. This is a strong brass pump, and will send a stream of water perpendicularly 40 feet, or it will send a spray, such as is used for bringing down swarms, 30 feet high. Of all the pumps we have experimented with, none answer so well as swarm-arresters as the Whitman.

DISCOUNT ON GOODS FOR FAIRS.

In view to the education of the people to more correct views of our pursuit, as indicated in an editorial elsewhere, we will, as has been our custom for years, furnish samples at a discount. All goods of our manufacture will be furnished at 25 per cent discount, the only conditions being that you will be allowed a discount only on samples (one of a kind), that they must be entered for exhibition at one or more fairs, and that you distribute judiciously the advertising matter we send along with the goods. If you secure any premiums, the money thus secured is yours for your trouble, in addition to the commission we allow you when you buy the goods. We will consider a box of 500 sections, 1 lb. of each grade of foundation, 50 brood-frames, flat, 50 wide frames, as units, and subject to discount as samples. We will also furnish free all you can judiciously use of the \$1000 reward cards.

AN ATTRACTION FOR FAIR-EXHIBITS.

Some of our old customers will remember that we used to advertise and furnish sections 4½ in. square, with fancy-shaped center, such as stars, hearts, diamonds, etc. We have not made these of late, but we have had frequent calls for letters to be filled with comb honey by the bees, to form mottoes. We have never been well equipped for making these till now. We have a full set of pattern letters to work from, and they are of such a size that three will fill an 8-section wide frame, the

openings forming the letters being about 7½ in. high and 5 in. wide. M and W, of course, are wider, and I narrower. The letters are of the following pattern:

FAIR, 1889.

The price will be 10 cts. per letter or figure. With thin foundation inserted, 15 cts. per letter or figure. In ordering, if you will write the letters in the order you want them, we can make 3 letters in one piece, just right to slip into a wide frame. Or if you don't happen to have a wide frame, simply tack a bar on top, to suspend it from, and hang it in the hive without a frame around it. The 4 figures, 1889, will go in a frame. To make the letters, we simply tack two ¾-inch boards together, mark the letter, and jig it out on a scroll-saw. To put in the foundation, separate the boards, lay a sheet between, and tack them together again. We make the letters large, because the bees will work in them more readily, and they are much more conspicuous when filled.

PREMIUM OFFER.

To those intending to make an exhibit, and who will agree to distribute judiciously the circulars we will send, we will furnish free one letter or figure for each dollar's worth of goods ordered, if the order amounts to \$4.00 or more. If foundation is inserted in each letter, we will furnish 2 letters for every \$3.00 worth of goods ordered.

KIND WORDS FROM OUR CUSTOMERS.

I received the package of tomato-plants at 10 p. m. last night; placed them in a little water over night, and potted them this morning. They were in prime order, hardly wilted, or a leaf injured. They can not fail to grow. I hope to have a good report to make next fall. CHAS. J. JACKSON.

Newton, Kan., June 27, 1889.

GOT HIS DOLLAR'S WORTH.

We all enjoyed reading your travels very much, and, in fact, all the Home talks and good things. If a bee-keeper can't get a dollar's worth from GLEANINGS he surely does not read and profit thereby. Please renew my subscription for one year. R. R. RYAN.

Bradshaw, Neb., June 13, 1889.

THOSE DOVETAILED HIVES "RIGHT TO THE DOT."

I am well pleased with those ten Dovetailed hives I received of you; they are right to the dot, and don't you forget it. I put up the 500 sections which came also, without breaking a single one in the bunch. MARTIN F. WILLIAMSON.

Friendly, W. Va., June 17, 1889.

HOW THE BUCKWHEAT WENT OFF.

Before I forget it I owe you a vote of thanks, or that doesn't exactly express it. I am very thankful to you for your kindness. I will try to make good the amount on GLEANINGS. It has sent me half a dozen calls for buckwheat. Can't a man touch you without getting himself spread out? Well, I will make it all right some time. J. H. KENNEDY.

Quenemo, Kan., June 12, 1889.

THE DOVETAILED HIVE JUST THE HIVE FOR THE GREAT MASS OF BEE-KEEPERS.

The Dovetailed hives ordered of you arrived in first-class order, and freight very moderate. We admire your ingenious method of crating, and are much pleased with the hives. We consider the Dovetailed as just the hive for that great class of bee-keepers who, farmers also, make bee-keeping an extra; have few appliances for putting hives together, and devote their attention to the production of comb honey exclusively. R. N. LEARNED.

Newton, N. J., May 27, 1889.

FOR SALE.—Italian queens, tested, at \$1.00 each, 6 for \$5.00; untested, 75 cents each. No foul brood. 12td L. A. RESSLER, Nappanee, Ind.

WILL pay 10 cents each for Oct. 1, 1882, number of GLEANINGS. A. I. ROOT, Medina, Ohio.

SPECIAL NOTICES.

HONEY QUEENS.

There has been such a call for honey queens from that imported queen spoken of on page 508, June 15, we have decided to sell her daughters at the following rates: Untested, \$1.50; tested, \$3.00; select tested, \$4.00. The mother of these queens still sustains her former reputation, and her bees prove conclusively that gentleness and energy make a successful combination. We also have one other imported queen whose bees are about as gentle and as good workers as the other one. Her daughters will be sold at the same price. Her queens, if any thing, are a trifle yellower. Be sure to mention, in ordering, that you want a "honey queen," otherwise we shall send you our regular queens.

SEEDS AND PLANTS SUITABLE FOR AUGUST PLANTING.

Asparagus, Palmetto. Oz., 10c; lb., \$1.50.
 Beans, Dwarf German wax. Pint, 10c. By mail, 8c extra.
 Beets, Eclipse. Oz., 5c; lb., 60c.
 Carrots, Early French Forcing. Oz., 10c; lb., \$1.00.
 Celery-plants, Henderson's White Plume, Golden Self-blanching, Golden Dwarf, or Boston Market. 10 plants, 5c; 100, 40c; 1000, \$3.00. If wanted by mail, add 5c for 10, or 25c for 100.
 Corn, Corey's Extra Early. Half-pint, 5c; quart, 15c. By mail, 12c per qt. extra.
 Cress, or pepper-grass. Oz., 5c; lb., 50.
 Cucumbers, Early Frame, Nichol's Medium Green. Oz., 5c; lb., 60.
 Grand Rapids lettuce, Henderson's New York, or Boston Market. Oz., 15c; lb., \$2.00.
 Onion, Mammoth Silver King. Packet, 5c; oz., 20; lb., \$2.50.
 Onion-sets, Winter or Egyptian. Qt., 10c; pk., 75c. By mail, 10c per qt. extra.
 Parsley, Fine Curled or Double. Oz., 5c; lb., 50.
 Alaska peas. Pt., 10c. By mail, 8c extra.
 American Wonder peas. Half-pint, 10c. By mail, 4c extra.
 Radishes, Scarlet Globe, Lady Finger, Chartier. Oz., 5c; lb., 60c.
 Radishes, fall or winter. Oz., 10c; lb., \$1.00.
 Spinach, Extra Curled. Oz., 5c; lb., 35.
 Turnip, White Egg, or Purple Top White Globe. Oz., 5c; lb., 40c.

STRAWBERRY-PLANTS.

Of these we have a plenty of extra nice Jessie or Sharpless; 10c for 10; 75c per 100; \$5.00 per 1000. Of Bubach we have also a good supply of nice plants. Prices are double those above. All strawberry-plants sent by mail at an additional expense of 3c for 10, or 15c for 100. I would advise that strawberry-plants be set where they can be shaded, unless we have plenty of rain. If the weather is exceedingly dry, they may require watering as well as shading to save them. A good watering, however, just before the plants are covered with a good

mulch of straw, leaves, or swamp grass, or something of that sort, will usually take them through the most severe drouth. Orders for strawberry-plants are liable to be delayed unless we have rains frequently.

KIND WORDS FROM OUR CUSTOMERS.

OUR HOMES.

I wish I could take you by the hand and have a good long talk with you. Our Homes does me more good than any sermon I ever heard. I would not do without GLEANINGS for almost any thing. Our Homes is written in such simple words that almost any one can understand it; and as I am not a man of "over-high" education it just suits me exactly. May you live long, and keep on doing good.

Carpenter, Ill., June 11, 1889. Ed. E. SMITH.

ONE WHO LOVED GLEANINGS.

How lonely is our home! Father died the 24th of May, aged 72 years. There are only four of us at home—mother and two sisters and myself. Father had been failing for the last two years. He was always a lover of bees, and he was always a great lover of GLEANINGS. He could not work, but would watch for GLEANINGS. The May 15th number came too late for him to see it. It came two hours before he passed away. He asked, every time we went to the office, if we got GLEANINGS. He could read some, and it passed away the time for him. Oh, how lonely it is without father! Almost his last words to me were to tell how he wanted me to fix some bees for a neighbor who wanted some. Father had read GLEANINGS for years, and we still expect to read it until we too are called up higher to meet him.

MARY E. COKELEY.
 Ritchie, W. Va., June 11, 1889.

ONE WHO IS NOT A CHRISTIAN, BUT YET LOVES THE FRUITS OF CHRISTIANITY.

It does me good all over in spots as large as a blanket to see the kind, conscientious, and prompt manner in which you do business. I appreciate and love people who wear their religion every day, as well as Sunday. Although I belong to no church, I try to do right and be honest. I like genuine, honest, and religious people, but I detest hypocrites.

W. A. CARTMELL.

Crowley, Texas, June 24, 1889.

[I am sure you have too high an opinion of your humble servant. If you lived near by me, and could see me day by day, very likely your ideal friend would tumble to pieces, and you would find he was about after the fashion of mankind in general, after all. It is Christ's spirit, and that alone, that can lift us above earth and things earthly.]

HOW TO FIX TOMATO-PLANTS DURING A SNOW-STORM.

The 13 Ignotums arrived in splendid condition. They are extra good strong plants, and now all stand upright, having scarcely wilted. Considering both strength and weight, I think the wooden box in which they were packed is as good as can be made for mailing purposes, and that you will have but very little if any complaint of damaged plants packed as these were. They came Tuesday; and fearing a frost I delayed setting them that day. Next morning the thermometer stood at 32°, and I waited until after dinner, when it commenced to rain, with the wind in the east, and thermometer at 37°. Thinking that the wind would shift to the south, I set out the plants and went to work in the shop. At 3 p. m. my wife called and asked if I knew that it was snowing. Looking out, every thing was seen whitening with snow, which came as if it meant business. I ran and got 13 Simplicity covers, and put them over the Ignotums, in a hurry. The snow fell fast and thick until 7 p. m., when it changed to rain, with the thermometer at 32°, at which point it had been four times before within a week.

A STEP FORWARD TOWARDS SUCCESS!

After carefully studying the demand of consumers and dealers, and selecting of the many styles of packages for comb honey the very best and the most attractive, we have now prepared an improved paper carton combined with a comb-protector. Honey, put up in these packages, will be bought in preference to all others at highest market price. Our patent comb-protector will prevent leakage and soiling of sections. Comb honey can be easily and quickly put up in our cartons. These advantages and the small cost of our cartons and comb-protector will save labor, time, money, and honey. Strohmeyer's patent comb-protectors require ¾ inch of the inside height of crates. Price list and sample carton sent free on application.

HONEY COLUMN.

CITY MARKETS.

KANSAS CITY.—*Honey.*—New comb honey is coming in quite freely. We don't look for a very active market before September. We quote white 1-lb. comb, 16c. Very little extracted on the market. We quote white clover or basswood, in kegs or barrels, 70¢ 7½¢; amber, in barrels, 6c. *Beeswax*, none in market. **CLEMONS, CLOON & Co.,**
Kansas City, Mo.
July 22.

NEW YORK.—*Honey.*—Our market is unchanged, although somewhat higher prices are asked for new extracted. There is some demand for new comb honey, but we have no stock yet. *Beeswax*, 26c.
July 22. **F. H. STROHMAYER & Co.,**
New York.

ST. LOUIS.—*Honey.*—We quote white-clover honey, comb, 1-lb. sections, 12¢ 13c. Extracted, clover, 5¢ 7c, new stock. We have reports from several of our shippers, and they say the dry weather of April caused not over 50 to 60 per cent of white clover to be gathered. But, with dry weather, prospect of full crop from fall flowers.
W. B. WESTCOTT & Co.,
St. Louis, Mo.
July 27.

CINCINNATI.—*Honey.*—Nothing new since our last report. We may note the arrivals of quite a number of small lots of new honey, with quite plentiful offerings. Demand is slow. Extracted brings 5¢ 8 cts. on arrival. Comb, 12¢ 15c in a jobbing way. *Beeswax.*—There is a good demand at 20¢ 22 on arrival for good to choice yellow.
July 22. **CHAS. F. MUTH,**
Cincinnati, Ohio.

ALBANY.—*Honey.*—Market not opened yet. Some talk of too much wet weather for crop, but I think the early sale after market opens will be the best. Free consumption does not begin until October. Consignments solicited.
July 24. **H. R. WRIGHT,**
Albany, N. Y.

NEW YORK.—*Honey.*—Our market remains quite active for extracted honey. Orange blossom, fine quality, sells readily at from 7¢ 7½¢. Off quality of Southern finds quick sale at from 60 to 70c per gallon. No new California honey on this market. Extracted would bring from 7½¢ 8c, while it is too early to stipulate on prices on new comb. *Beeswax* is dull, and prices declining on account of limited demand. Good yellow sells at from 25¢ 25½c.
July 22. **HILDRETH BROS. & SEGELKEN,**
New York.

BOSTON.—*Honey.*—No change in the honey situation. We are expecting some new this week. At present we are without a single pound of comb honey, but we are receiving some very fine extracted from C. M. Lincoln, of Rupert, Vt., and it will sell readily at from 8¢ 9c. *Beeswax*, 24¢ 25.
July 22. **BLAKE & RIPLEY,**
Boston, Mass.

ST. LOUIS.—*Honey.*—No market for comb honey. Extracted, quiet at 6¼¢ 6½¢ for bright; 5¢ 5½¢ for dark.
July 22. **D. G. TUTT GRO. Co.,**
St. Louis, Mo.

DETROIT.—*Honey.*—No new honey in the market, and old all sold. *Beeswax*, 24¢ 25. **M. H. HUNT,**
Bell Branch, Mich., July 25.

COLUMBUS.—*Honey.*—Honey is coming in very slowly; selling at 16¢ 17c for nice 4¼x4¼ sections.
July 22. **EARLE CLICKINGER,**
Columbus, Ohio.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections and 12-lb. cases, at 16 c (for 100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey, at \$5 per can. Safe arrival guaranteed by freight.

OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.

FOR SALE.—10,000 lbs. of choice white-clover honey in first-class one-pound sections, 24 and 48 lb. cases. This is the finest honey I have ever raised. If you desire to purchase, state quantity and I will quote bottom prices. **EZRA BAER, Dixon, Ill.**

WANTED.—100 to 200 lbs. extracted honey.

DR. G. H. COREY, Bristolville, Ohio.

PRICES REDUCED.

Untested queens, 65 cts.; 10 for \$6 00. Select tested, \$1.50; ten 2-cent stamps taken where postal notes can not be had. Can send by return mail. Money orders payable at Nicholasville.

OUT-APIARIES NO. XII.

UNLOADING AND FREEING BEES.

UPON hauling the first load of bees to an out-apiary, no special care need be taken till the load is taken off, for no bees are flying. After the first load, however, the case is different. Unless it happens to be so early or late in the day, or so cool that no bees are flying, great care must be taken. Use judgment as to how close you dare drive to the apiary, unless, indeed, there is no chance to approach near enough for the bees to trouble your team. I once kept bees in an out-apiary where there was no chance to get in the inclosure where the bees were, so I used a wheelbarrow to wheel them from the wagon to the apiary. But ordinarily you can drive nearer than it would be wise to have a team stand. Before you drive close enough to have any anxiety, get down from your wagon, put up your lines and have every thing in readiness to unhitch in a twinkling when you stop. If you have a single horse, unfasten the hold-back straps so that nothing shall be left to do but to unhitch the traces. Then lead your horse to the place where you will unload, unhitch as rapidly as possible, take your horse to a safe distance, and tie him; then go back and unload. Make some calculation to put the first loads in such part of the apiary that they shall interfere least with you when hauling succeeding loads; that is, in general put the first load in the furthest part of the apiary. I am not sure what is the best way to let the bees out of the hive after putting them on the stand; but I wouldn't let any of them out till I had finished unloading. Sometimes I have let them out without smoke, by moving very softly; but on doing so I am quite apt to take a short foot-race immediately after the bees issue from the hive. One might think that, after being pounded over the road so

long, bees would be good natured; but for some reason they are apt to be cross; and when a lot of cross bees rush out of a hive whose location they have never marked, I am doubtful about their finding their way back to the right hive, and a little skeptical about their being kindly received in any other hive. A few whiffs of smoke before unstopping the entrance makes matters pleasant, and I don't know whether that is better, or to dash cold water into the entrance.

I suspect it is better to let bees alone as much as possible the day they are placed in a new apiary; and I make a practice, pretty generally, when I take a load to an out-apiary to-day, to overhaul those that I hauled yesterday, after opening those I brought to-day.

BEST TIME TO TAKE BEES TO AN OUT-APIARY.

In the spring, pasturage is usually scarce; and if you have enough bees so that you need to take them from home for pasturage, they are likely to need the extra pasturage in the spring as much as any time, so that you will do well to commence hauling your bees just as soon as you can in the spring. Even if there is but little to work on in the spring, that little is quite important to encourage brood-rearing; and if you have 150 colonies, and take 75 of them away, the remaining 75 will have just twice the pasturage they had before, be that little or much. Besides, as friend Root suggests, the outside pasturage may be better. Bad roads may delay matters, for in some localities there are times in the spring when the roads are almost impassible. I would wait some little time for good roads.

I have sometimes kept bees home till well on in May; in fact, till one of the colonies had swarmed, as I was feeding daily in the open air, and I thought this would be of more advantage to the bees than the little they would gather in the fields at the out-

apiary. I don't think so now. I want them away as early as possible.

C. C. MILLER.

Marengo, Ill.

BEE-KEEPERS' CONVENTIONS, ETC.

OUR GOOD FRIEND DR. MASON GIVES US SOME GLIMPSES AND HINTS IN REGARD TO THEM.

FRIEND ROOT:—I wish I had the descriptive power of some of your correspondents, so that I could tell about my observations, made when on a Ramble, and of the amateur experts I see at such times, in an entertaining way. At any rate it may not be uninteresting to learn that, in this locality, or within the bounds of our Tri-County Agricultural Society, comprising the counties of Lenawee and Monroe, Mich., and Lucas, Ohio, the bee-keepers are awake to the importance of improving every opportunity to educate the people in regard to our important and growing industry.

A year ago last winter the society held a three-days' meeting at Monroe, Mich. It was just "chock full" of enthusiasm, and bee-keepers did their full share. It was so arranged as to have our specialty discussed in the evening, when there would be a full attendance of people from the city, whom it is quite desirable to disabuse of their false belief in regard to the adulteration of our product, and correct the false impressions made by "Wiley" lies and newspaper squibs—the production of the fertile imaginations of reporters.

The next week after the above-mentioned meeting, a farmers' institute, under the auspices of the Ohio State Board of Agriculture, was held in this county, ten miles from Toledo, at which our friend T. B. Terry was one of the lecturers, and our specialty was again brought to the notice of the farmers and others by the reading of a paper by myself, and the subject received its share of attention. And again at a like institute held in another part of the county on the last day of last year and the first day of this, the subject was again presented by an essay that gave something of the natural history of bees and the benefit they are to the farmer and to the horticulturist.

Last winter at Adrian, Mich., was held the anniversary of the Lenawee County Horticultural Society, and one of the principal addresses, through the efforts of one of your patrons, Mr. D. G. Edmiston, of that place, was on the relation of bee culture to horticulture. It was well received. Again in January last was held at Adrian the meeting of the Lenawee County and the Tri-County Agricultural Societies; and on the programme for one of the evening sessions, half of the time was given to a paper on bee-keeping, etc., by H. D. Cutting, of Clinton, Mich., and to one by your humble servant. The subjects of both papers were discussed by such bee-keepers as D. G. Edmiston, Mr. Allis, A. M. Gander, and others; and the discussion showed that a lively interest was taken in the subject. I never was at a gathering of any kind where so many sample copies of bee-journals were asked for by interested parties.

Mr. Newman had kindly sent some copies of the *American Bee Journal* for distribution, and I had some extra numbers of *GLEANINGS* to distribute also, and they were given to interested parties, and I doubt not you will hear from some of them. I had some copies of "Dot Happy Bee-Man" song

with me, and at the close of the discussion of the bee essays the glee-club sang it, to the evident satisfaction of the hundreds present.

At the close of the institute, at the solicitation of our friend H. D. Cutting, we (that's my better half and I) went home with him, 22 miles by rail, and had a good three-days' visit with him and his family.

Of course, I had to take a good peep at his bees. Till the last two or three winters his bees have been wintered outdoors, packed on their summer stands, but he is now a thorough convert to the benefits of cellar wintering. His cellar is under his house, and used as a family cellar for vegetables, etc., and is 16x24, and 7 feet high. He has made a kind of rack along one side and end, so as to hold three tiers of hives, which are set with their entrances toward and within a few inches of the wall, each one being easily removable without disturbing any others. The frames are covered with enamel cloth, and the bottom-board is left on. Some of them were placed in winter quarters Oct. 20, and the last on Nov. 20; and I am safe in saying that there were not two quarts of dead bees on the cellar bottom, from about 40 colonies, and none had been taken up. A small window at one end admits light at all times, sufficient so that no artificial light is needed to see to get things from the cellar, and but little light reaches the bees. He prefers a temperature of from 38° to 40°. If with the temperature of my cellar, 50°, I were to admit light, I should have to carry out mostly dead bees in the spring.

On the evening of the second day of the institute I had the pleasure of going home with and being entertained by Mr. E. W. Ellis, president of the Adrian Scientific Society. He lives five miles in the country, and, metaphorically, is full of bugs, beetles, reptiles, etc. Being rather timid, and having no especial liking for such animals, you can perhaps imagine my feelings on being ushered into a room about twelve feet square, more or less, "zhust zhammed crammed full of dose pets vot vorks all der day und nefer schleep nights, more'n ten thousand hundred, 1 bets." But then I soon found they were all dead. Mr. Allis is an enthusiastic entomologist, and he has a large library of scientific books, and seemed to know all that was in them. Of course, he keeps a few colonies of bees, and tries all sorts of experiments with them.

We were entertained at Adrian by Mr. Edmiston and family; and of course he keeps bees, or how else could I possibly have stayed over night with him? His bees are wintered on their summer stands, in chaff, and other hives of that character; and being a small-fruit grower and nurseryman he does much toward properly educating the people of his locality in regard to bees and their work and production.

During the last two winters I have attended five of these institutes, held in the three above-named counties, and made special preparation to present our branch of agricultural or horticultural interest, bee culture, etc., in the most interesting and attractive form that it was possible for me to do. If any other bee-keepers were present, they have willingly "lent a helping hand." In no case has an effort been made to induce any to engage in bee-keeping as a business, but to give, in as entertaining a way as possible, a brief natural history of bees; tell where honey comes from, and how the bees gather, store, and ripen it; how extracted honey is secured, and, if possible, illustrate; tell how

and in what way bees are a benefit in fertilizing and cross-fertilizing fruit and other blossoms. Also tell about the reported injuries done to fruits, grapes, etc., by bees, and how they have been accused of "eating young ducks," etc., and correct these false impressions. It is the bee-keepers' own fault if our business is not properly brought before the public at agricultural, horticultural, scientific, and other gatherings. To be sure, it is not an easy matter for a large majority, perhaps, of bee-keepers to prepare entertaining articles on our specialty; but "there is nothing like getting used to it." If one is not accustomed to it, and does not feel capable of preparing an entire article, just let such a one get, if he has it not already, a work entitled "Bees and Honey," by Thos. G. Newman, and the first fourteen pages will make an interesting introduction. It has just such information as is interesting to the general public, and written in a very interesting way. When the next opportunity presents, make selections from Prof. Cook's Manual of the Apiary, the A B C of Bee Culture, either or both, always giving proper credit, of course, and you will be surprised at the amount of interesting and valuable information that can be thus furnished to willing listeners. And now that the new edition of Langstroth on the Honey-Bee, just revised by Charles Dadant, is to be had, there seems to be no end to interesting matter. New ideas are put forth, and the old ones are put in new dress, so that one is almost "lost in wonder, love, and praise."

Then the different bee-journals are constantly teeming with things new and old, so that, if one had nothing else to enjoy or do he might almost revel in an elysium of bee-lore. We bee-keepers should be part and parcel of all agricultural and horticultural gatherings, whether for discussion or fun and frolic, and also of many scientific and social gatherings and should "let our light shine." In order to have the proper amount of time allotted to us at these gatherings we must be on hand and have a hand in making up programmes, and see that the right ones are put in to fill the bill.

A. B. MASON.

Auburndale, Ohio, Mar. 18, 1889.

Friend Mason, I can readily imagine how all these conventions succeeded, had a good attendance, and that fun and frolic, as well as education and information, were the order of the day, providing *you* were present. I have attended some conventions where they could not get hold of a Dr. Mason, a Dr. Miller, nor a Prof. Cook, and it was hard work to keep things lively, and to keep up an interest. We certainly should be part and parcel of all agricultural and horticultural conventions, and we ought to let our light shine. If we do not it is very apt to burn dim and go out. May God help us along the line which you have mapped out.

COMB-HONEY SLANDERS.

THE CATCLAW AND WAHIA, OF TEXAS, ETC.

MR. ROOT:—I inclose you a copy of the *Brackett News*, our local paper. You will notice an article entitled, "A Professor Mistaken." As GLEANINGS reaches only those who are fully aware that manufactured comb honey is only a myth, we educate the public in this section by writing occasionally to our local papers. Our greatest opposition here is not from

the "manufactured comb-honey" people, but from the numerous old fogies who keep a few box hives and sell a pound of black comb containing honey from various sources, good and bad, pollen, and perhaps a few bees, all for 10 cents.

You will not, I hope, put us down as frauds for claiming on our letterheads that the catclaw honey is equal to clover honey. You perhaps have not tasted catclaw honey. I have tasted clover honey, and can judge. We hope that, in a few years, catclaw honey will be as well known in the North as the clover is in the South. At present, bee-keeping in this section is only in its infancy, and we have not yet any Hetherington, Dadant, Doolittle, or Heddon, although we may have soon.

Our principal honey crop is in the spring. Bees fly on and off all through the winter. They work on mistletoe in December and January; aiguita in February; mountain laurel in March. This last is very valuable, as it comes at a time when the queens begin to lay. From the middle of March to the middle of April we have various flowers—prairie flowers, pssymon, hackberry, grape, daisy, etc., which stimulate brood-rearing, but not enough to show in the hives. Swarming commences about March 20th and lasts until April 20. Of course, it varies a little. Wahia, a short bush with feathery leaves (like acacia), has round white fluffy balls. This opens April 20, and yields half a crop of flowers, generally for three weeks. Catclaw, a bushy tree, has a similar flower, but long. It opens up about May 6, and to that we look for the other half. The honey from both these sources is white, and has a delicate flavor, but it granulates quickly.

From the end of May to October we have a little honey from corn (which we never extract); and after a heavy rain we have honey from white brush and sage; but it is in such a small quantity that we can seldom keep it separate. It is much superior to catclaw. In October we have sunflowers and broomweed. This honey is amber-colored, but has a nice taste, not too strong.

This year has proven to us very conclusively that it is an advantage to have out-apiaries.

Wahia and catclaw are plants for a dry climate, and we had so much rain this winter around our apiaries that the plants had very few flowers on them; whereas, outside a circle of about ten miles in diameter, of which we were in the center, the wahia and catclaw yielded abundantly. The bees from the apiary had to fly four miles and made only half a crop; whereas, if we had had an apiary at Elm Creek they would have made a full crop.

The rain falls in spots, and next year the conditions may be reversed, or perhaps the same; but in a country where one square mile will yield honey in abundance, and the next square mile none, I think it is well to have out-apiaries. When the year is good we can put from 160 to 200 colonies in one yard, without overcrowding.

We obtained a select tested queen from Paul Viallon, at the end of April, and we have now over fifty young queens laying that were raised from her, and they are keeping three Langstroth frames full of brood, which is good for this time of the year, when there is no honey.

We can only reiterate the hope expressed by so many other bee-keepers, that next time you go on a trip, you will manage to pay us a visit.

ST. LONGLEY BUCHANAN.

Brackett, Tex., June 20, 1889.

could be by sugar feeding, when no stores were to be had. If one commences in the fore part of June with any sort of a nucleus having a laying queen it can be built up strong very speedily. We presume you did not get any brood from other colonies; but we infer that you took queens or queen-cells. You also purchased 18 or 20 queens; but as all the nuclei died to which these were given, it is perhaps fair to make no account of it. The fact that you did winter through 45, all made from this original colony June 7, is astonishing. I once increased 11 colonies to over 50, and wintered them all; and I did it much on the plan you have mentioned. I suppose you did not keep any account of your time. If you could tell us just how many days' work it took to do this we could tell better whether it is a paying business. My impression is, that it will pay handsomely whenever bees can be sold, say for \$5.00 a colony. We used to have a good deal of sport in hunting wild bees, and bringing them home; but after I learned how to make colonies by increase, in the way you have outlined, I decided that I could build up colonies a good deal cheaper than to take them out of trees in the woods.

QUEEN - EXCLUDING HONEY-BOARDS.

BEE-JOURNALS, AND ARE THEY FULLY OF PUFFING UP THINGS TOO MUCH?

ON page 441 of GLEANINGS I notice an article from the pen of my neighbor, J. F. McIntyre. Said article is headed, "A Big Testimonial in Favor of Perforated Zinc." Well, that big testimonial brought back to my mind what a friend of mine said to me on the Ojai about six years ago, when I asked him why he did not take a bee-paper, he being quite an extensive bee-keeper. He said he used to take several Eastern bee-papers, but he got tired of reading fine-spun articles and big reports from men that kept five or six hives of bees to experiment with. Well, I think that was a pretty big hurrah for one honey-board. If it had been 50 or 100, then I should have said hurrah too. I have used the zinc honey-boards again this season that we used last (see page 358), with a little better result than last season. This year four out of eight let the queens go through about as well or as easily as the workers. One of them we saw the queen go down through with perfect ease (this queen was a good-sized Italian); but, as you say, those zincs may have been made on your old machine that was somewhat worn. One of them was about half full of drones, hung by the neck, their bodies dangling down from the under side of the zinc. The other four worked entirely satisfactorily; and if I can get a queen-excluder that is a queen-excluder, I will use over one thousand of them next season.

I was at friend McIntyre's a few weeks ago, and saw, while there, one of Dr. Tinker's honey-boards. It appeared to me that the bees can get through it much easier than they can through the all-zinc ones, as the strips of zinc have two rows of holes in them; thus each row is close to the wood slats; and I notice the bees can pull themselves up through the perforations by catching hold of the wood slats. I gave Mr. Intyre one of my zinc

honey-boards. He will probably report his success with it. McIntyre and myself are the only bee-keepers in this county who have ever used a honey-board of any kind, I think. He has used probably not more than one or two. I have used over 200 Heddon slat honey-boards for the last three or four years, but I think I will make them all queen-excluding next season, for we have several thousand drone combs that we want to keep the queens out of. Can you tell me where I can get a machine to make the strips of zinc, with two rows of perforations in them? There are many bee-keepers here who count their hives by the hundred, who don't know what a queen-excluder is.

The honey crop in California is very short this year. I think it is less than a quarter of a crop. I have a list, nearly complete, of all the bee-keepers in the county, of the number of colonies each one owns, and the number of tons of honey produced by each. I will send you a report when complete, if you wish it.

DATE. May.	Weight or Gain in pounds.	DATE. May.	Gain in pounds.	DATE. June.	Gain.
10	2	29	2½	16	0
11	1½	30	2½	17	½
12	1½	31	1½	18	½
13	1½	June.		19	1½
14	1½	1	2½	20	0
15	½ lost.	2	3	21	1
16	0	3	3	22	1
17	3½	4	1½	23	¾
18	2½	5	2	24	1½
19	3½	6	1½	25	1½
20	2½	7	1½	26	1½
21	5	8	1½	27	¾
22	4½	9	2	28	2½
23	3	10	3	29	4
24	4	11	2	30	½
25	½	12	1		
26	3½	13	1		
27	3	14	1½		
28	3	15	1½		

You can see by the record which I send you, of a hive that I had on scales this season, that the honey came in very slowly. It does not look very big for California, I assure you; but it will partly explain to you how myself and my four boys did all the work of extracting and taking care of over 1100 hives of bees. Myself and the three youngest boys extracted in 13 hours 2½ tons of honey, and we did not play much of the time either. Such rapid work is in a great measure due to the very convenient extracting-house that we have, a description of which I may give you in the future.

FOUL BROOD.

This is getting to be very scarce in this county. I commenced experimenting about the time that you were here last winter, with a very simple remedy for the cure of foul brood. I take two or three spoonfuls of sulphur, put it in an old fruit-can, and pour over it enough kerosene oil to make a thin paint of it. Apply it with a small paint-brush to the combs that have the diseased cells in them; brush them all over with the sulphur and oil. It will kill some of the healthy brood, but not all of it; also brush it over the frames and as much of the hive as you can without getting it on the bees. One or two applications have cured six or eight for me this season, or at least they are perfectly healthy now, and some of them were very bad.

Several combs were nearly half diseased. If the disease does not appear again in those same colonies by next spring, I will shout "Eureka!" Now, friend Root, don't say that you smell brown coffee or chilled brood, or something else worse.

L. E. MERCER,

San Buena Ventura, Cal., July 6, 1889.

FALSE STATEMENTS IN REGARD TO THE HONEY BUSINESS OF OUR COUNTRY.

As a protection to our bee-keeping population, we propose in this department to publish the names of newspapers that persist in publishing false statements in regard to the purity of honey which we as bee-keepers put on the market.

HOW TO PREVENT THEIR PUBLICATION, AND HOW TO CORRECT THEIR BANEFUL INFLUENCE; SOMETHING FOR OUR SUBSCRIBERS TO DO.

IF there is any thing that the veracious scribes like to talk about in the press, and roll under their tongues as a precious morsel, and finally spit out upon the public, it is the subject of adulteration. They seem to have gone wild on the subject. They know people like to be told that they are being humbugged; and they know that the story of "Yankee ingenuity" will cause the gullible public to hold up their hands, "Did you ever!" and as long as there is a demand for it, so long the same old story will be rehearsed, unless there is a stop put to it. "Manufactured comb honey," "artificial combs deftly filled and capped over by means of appropriate machinery"—oh dear! how stale it sounds! If the reporters could only change their tune a little it would be gratifying; but "appropriate machinery" has to be stuck in every time. Well, within the last few weeks, or at least since the Philadelphia *Record* commenced republishing the comb-honey story, the whole press all over the land has been reiterating it in long and short squibs. Clipping after clipping has been sent in until we feel discouraged. We have published them, and refuted them publicly, and sent marked articles to the editors, calling upon them for retraction. We have written private letters, asking them in all fairness to be kind enough to make some amends. Nor has Bro. Newman of the *American Bee Journal* been less vigilant. We have about come to the conclusion that the bee-journals need assistance in helping to cry down the evil. Jones sees a false statement about the comb-honey business in one of the columns of his local paper. He cuts it out, marking the date and issue of the paper, and sends the same on to us, or to Bro. Newman, of the *American Bee Journal*. Well, so many clippings like this have come in that it would almost fill one issue to make any thing like an appropriate denial for each one. Quite recently some four or five correspondents, instead of sending the marked article to us for refutation, have themselves called upon the editor, showing the absurdity of the statement in a recent issue of his paper. In two or three instances they have written out a refutation themselves, and this refutation appears in the very next issue of the paper, so that the false impression is corrected right where the mischief is done, and not in the columns of a bee-paper whose readers know perfectly well the untruth. The following is a spicily written article from the pen of one of our subscribers, Mr. Julius Gerard, of Mariposa, Texas; and as it illustrates the point we are getting at, we reproduce it here entire:

A PROFESSOR MISTAKEN.

GLUCOSE AS ARTIFICIAL HONEY; A PRACTICAL BEE-KEEPER'S KNOWLEDGE OF THE FACTS.

Editor Brackett News:—I suppose whenever you want to get the real facts about any thing you refer to your *Encyclopaedia Britannica*; for instance, if you wish to know how far it is from Brackett to the sun, you refer to the *Encyclopaedia*; and whatever the given number of miles may be, you or any one else will accept it as a fact. I am sorry to say, however, that my confidence in the American *Encyclopaedia* has been lowered 100 per cent, because I see at least one instance in which hearsay is given out as true science.

Mr. Chas. Morris, of the Philadelphia Academy of Science, writes concerning glucose, in Vol. III. of American Supplement, page 537, in the left-hand column, 21st line from the top, as follows:

"Glucose is used chiefly in the manufacture of table syrups and confectionery, in the brewing of ale and beer, and to some extent as food for bees and in the making of artificial honey. No reliable statistics can be had as to the quantity used in brewing, since brewers seek to conceal the fact of its employment. When it is fed to the bees, the honey yielded by the bees is almost pure glucose. In artificial-honey making, the comb is made of paraffine, and filled with pure glucose by machinery. For whiteness and beauty it rivals the best white-clover honey, and it can be sold at less than half the price. Its one defect is, that it is not honey."

Now, sir, this falsehood is given by a professor of science, and published as a fact in the *Encyclopaedia Britannica*, a work to which thousands of people refer as authority.

If the author of the article on glucose will take the trouble to come out to the Mariposa apiary I will convince him that his education as a bee-keeper has been sadly neglected, and that what he wrote about artificial honey being made of glucose and then put into artificial comb by machinery, is false; and if he has taken no more pains in writing the other parts of his work than he did in this, I would not give a nickel for all the volumes of the *Encyclopaedia Britannica*.

Mr. A. I. Root, of Medina, Ohio, offers a reward of \$1000 to any one who will show or tell him where artificial comb honey is made; this offer was made because so many false reports have been cast abroad about honey. Mr. Root has not yet found anybody who claimed the reward.

If Professor Morris, the glucose gent, tells us that the distance to a certain star is just 400,000 and $\frac{1}{2}$ of a mile, I for one am willing to swallow it, even to a fraction of a mile. But when he wants to tell me or any other progressive bee-keeper any thing connected with our industry, he should be a little more careful, as we never go by hearsay, but by facts. That man is doing a hard-working class of men a great injury. I can assure you, dear sir, that there is no artificial comb honey made by machinery, and that there never was any made.

Mariposa Apiary.

JULIUS GERARD.

Another one of our subscribers, also secretary of the Ohio State Bee-keepers' Association, Miss Dema Bennett, of Bedford, O., who, after having read the usual yarn about manufactured comb honey "definitely filled by appropriate machinery," in a large Cleveland daily, called upon the city editor in person, proving to him the falsity and absurdity of the statement respecting manufactured comb honey, which appeared in a recent issue of his paper. After telling him that tons and tons of honey are produced honestly, she referred him to us. As a result of this visit he wrote us a letter asking for facts in regard to the honey business. We immediately sent him a card, offering a thousand dollars for a sample of manufactured comb honey, "definitely filled by means of appropriate machinery." We also wrote him a long letter, detailing the importance of the honey industry in the United States, telling him where he could find out just

how bees "make honey," by sending a reporter. We referred him to Dr. A. B. Mason, Auburndale, O., and to H. R. Boardman, of East Townsend, O., and we requested, as a special favor to bee-keepers, that he send a reporter to either one of these gentlemen, and report what they see in his own paper.

A personal letter, written to the editor who has damaged the bee-keeping industry by one of the falsehoods, or, better still, a personal visit itself, will secure the attention that a prompt denial from a bee-journal might fail to do. In the one case Mr. Gerard wrote an article to the Brackett *News*. In the other case a lady bee-keeper (and what editor would not give one of the opposite sex a fair hearing?) called upon the city editor and enlisted his interest so that he even wrote to A. I. Root for information. The point is, that the *refutation or denial should appear in the paper in which the falsehood has been published*; in other words, those in whose minds the false impression has been created should have a speedy denial. These large papers will rarely deign to publish any thing from a small paper, but they will take something first-handed, as a general thing, providing the right influences are brought to bear. Now, then, we suggest that, instead of sending so many of these clippings to us, *you sit down yourself* and write to the editor of the paper in whose columns the false statement appeared. We will furnish free all the \$1000 reward cards you can use, and other matter you may call for. The more bee-keepers who will do this, the more effect it will have. Be sure to write in a courteous and gentlemanly manner. Do not call them a "pack of fools" or a "set of liars;" but write in such a way that they will respect the writer. Of course, we shall not cease pecking away at the falsehood, as we have done in the past, but we solicit the most hearty co-operation of our subscribers. Do not forget that, when the item appears in your local paper, a *prompt denial from yourself*, especially if you are a person of influence, and one whose word even the editor himself has no reason to doubt, will have more effect upon the editor than a denial from a bee-paper perhaps several hundred miles away. Do not leave any local editor unvisited, who dares to slander our industry by publishing any thing about "artificial combs deftly filled and capped over by appropriate machinery."

DR. MILLER ON SWARMING AND ITS PREVENTION.

THE CAGED-QUEEN PLAN.

I AM glad to see the views of Hasty, Doolittle, and Stachelhausen on swarming. No other matter connected with bee-keeping, at present, possesses more interest for me. In raising comb honey, swarming is the one great drawback that upsets all plans; and if we know the conditions necessary to induce swarming it may help us toward prevention. Indeed, I care very little to know the cause or causes of swarming, only as it helps me to know how to prevent it. Sometimes I think I have prevention of swarming just in my grasp, and then like a "will o' the wisp," it's away

off. I don't like to tell how much I've done in different years to spoil my crop of honey by trying experiments to prevent swarming. The experience of this summer has muddled afresh some of the things that I thought I had pretty well settled, and leaves the whole matter an open question. Years ago I practiced with considerable success the plan then recommended by friend Doolittle for the management of swarms, which was, in brief, to cage the queen when a swarm issued; in five days, cut out all queen-cells, and in five days more destroy queen-cells again, and liberate the queen. This worked well, and I am not sure whether any plan can be adopted that will give better crops where white clover gives the only surplus. The great objection to it is, that it requires some one to be constantly on the watch to see the swarms issue. After trying various plans, and giving them up in despair, I came back last year to caging queens again. After following the Doolittle plan already mentioned, the colony thus treated never gave any trouble again about swarming that season. It seemed reasonable that the same plan might be used without waiting for the bees to swarm, so I caged the queen before the colony had swarmed, looking through the brood-combs and destroying all queen-cells, if any were already started.

The queen was placed in the cage, between two top-bars in the brood-nest, and the bees always feed her there. I think in no instance have I found a queen dead in the cage after being so placed. After remaining thus for ten days, all queen-cells were destroyed, if there were any, and the queen liberated. Sometimes no queen-cells were started during the caging of the queen, but generally several were found sealed at the end of the ten days, and these cells were of the best kind. You will see that this varied not such a great deal from the old Doolittle plan, and I expected the same results but with some fears, as I have been so often mistaken in what to expect from bees. This year I have had a good many cases in which the bees swarmed out after the queen was liberated, sometimes in two days after, and sometimes sooner, the queens not having made any start at laying. Indeed, the year has, I think, been an unusual one in the matter of swarming. Many colonies have swarmed out while the queen was caged in the hive, and there seemed to be one or more cases where the bees, I think, remained clustered on a bush with no queen. At the Bolden apiary a large swarm clustered on a low bush, remaining there two days and nights. I suspected that a clipped queen had traveled there with them, but I found nothing of the kind. If a young queen had been with them it hardly seems that they would have remained so long clustered, as the weather was fine. When I found them they had dwindled to a pint or more, and had deposited on the bush a mass of white wax of irregular form, sufficient to make a ball the size of a hickorynut or walnut. I cut off the bush and ran the bees into a hive in which I put a comb of honey and an empty comb—no brood. I looked over the combs carefully, confidently expecting to find a queen of some sort, but could find none. Two days later I found them busily storing honey, having started two queen-cells with pollen in them. I then gave them a sealed queen-cell. I incline to the opinion that a colony with a clipped queen had swarmed and settled, most of them having gone back, gradually, to the

hive, the queen having been lost. At present I am trying the plan of keeping the queen caged for some days after destroying cells the tenth day. You thus see I am still anxiously seeking to learn how to prevent, not increase, swarming.

HOW TO LOAD HIVES.

You think, Mr. Editor, I should load hives on a wagon with the frames running in the direction of the road, to prevent loosening frames when bumping down off bridges. So I should, if the road were largely made up of bridges, and it is possible I am wrong; but the bumps of that kind are very few, and the wagon box is constantly shaking from side to side in such a way that the swing would gradually loosen the frames, so I always load the hives with the frames at right angles to the direction of the road. Last spring I hauled nearly 200 to the out-apiaries; and although pretty heavy with honey, not a frame was loosened, and the same was true about hauling home the previous fall when they were very heavy with honey. C. C. MILLER.

Marengo, Ill.

Yes, friend Miller, we do not care so much about the *cause* as we do the *prevention* of swarming. If the cause will give us the clew to its prevention, well and good. We would much rather have good strong colonies—the stronger the better. It is true, new swarms have a peculiar vigor; but the parent colony loses sometimes four or five days in semi-loading in its preparation for a swarm—days that are of utmost importance so far as the production of honey is concerned. We have one good strong colony of imported stock that has not swarmed at all, nor even built a queen-cell. It has kept right on bringing in honey while the rest were getting ready for their picnic in the air. Now, if we can make these restless colonies behave like this one by caging the queen, what a bonanza we shall have!

LETTER FROM ITALY.

A GLIMPSE OF BEE-KEEPING AS IT IS IN THE NATIVE HOME OF OUR ITALIANS.

EDITOR GLEANINGS:—It is a nice thing to communicate to your brethren in bee-keeping your victories and the number of pounds harvested; but, American friends, what do you think of 1889 up to date? Somehow or other the pen does not seem to run so well. I'll do my best, however.

When upon the Alps to look over my bees I asked an old woman near my yard, 76 years of age, "Do you ever remember such a year as this one?" She answered me, "Yes, but once when I was yet a girl, when it rained for such a long time that corn was being sold for 18 cents a kilogram."

I wonder what honey will have to be sold for if this weather continues. In fact, but a few days excepted, this spring has been but a continual rain—just enough to prevent bees from going out. A warm temperature prevailed—just the thing wanted; fruit-trees were in full bloom, and the poor bees inside nearly starving. Stores were used up in a most wonderful way; but about the 20th to the 25th of May, brood-rearing came to a standstill, owing to shortage of stores, and scarcely any honey coming in. About the 15th of June this year my colonies had to be fed, and some at the Alp apiary

starved on account of rain, with plenty of honey in the fields. Out of the 102 colonies which I had this spring at the home apiary down in the valley, only about nine swarmed, owing to the bad weather prevailing during fruit-bloom. April 25th to the 20th of May I did not care to prevent swarming, wanting to increase the number of my colonies steadily. In the valley, however, the bee pasturage is very scarce; in fact, my only resource for the present, of any account, is chestnut. Notwithstanding the very beautiful hills, having at the back the lofty peaks of Italy's crown, my bees would nearly starve, or at least give but little increase, even in good years, were they not migrated in due time to fields more profitable to myself and enjoyable to my faithful workers. You see, I combine the Alpine holiday stay with the occupation on which I am relying for my "bread and butter." Like you, I am engaged in bee-keeping, not as a pastime, but as a regular business, in which pursuit Mr. Dadant was my principal master, without, however, having ever seen his face, and the one who decided my shaking hand to cut the rope which tied my frail bark to the land of hesitation; and GLEANINGS is the always long-looked-for fortnightly visitor; and, more than that, the regular companion on the lofty mountains and along the Alpine valleys while on apistic rounds. I have taken, besides, a partner in business whom I hope you all have already taken too, who promised me that, if I were faithful to him, "every thing I would undertake would prosper." I am trying hard to do so, dear friends.

Mr. Dadant's controversy in the *Apicoltore* of Milan, on the Berlepsch Italian small square frame versus the Langstroth-Quinby frame, still enlarged by Mr. D. himself, convinced me of the superiority of the shallow-frame hive, with large brood-chamber, with equally large surplus apartment; in fact, the little experience I have had with them has already more than convinced me of the importance of some conditions in preparing colonies for the harvest, especially in moving them from one field to another, which I have done for the last years, when moving my hives from the valley to the pasturage on the Alps; viz., migratory bee-keeping, which, when done with care, and under certain rules, has proven to me most profitable, about which I will report later on if you care for it.

But I should want the Rambler's pen, to draw out a sketch of the writer, the donkies, and the carriers of the "alveari" (hives), when, a few weeks ago, notwithstanding all the care taken, some of the yellow-jacket ladies got out and went for them. O Dr. Miller! come and help, please.

Suserna S. Giovanni,

F. MALAN.

Waldensian Valleys, Italy, July 7, 1889.

And so, friend M., it transpires that the great amount of rain through the spring and early summer extended not only throughout the United States, but even across the ocean to far-away Italy. We are glad to get this glimpse of bee culture from you; and we are more rejoiced than we can tell, to know that you have taken Christ Jesus our Savior as a partner in business. Truly "we be brethren." If it should ever be my good fortune to visit Italy, it will add much to the pleasure of the trip to think that I have real brethren over there—brethren through Christ Jesus our common Lord and Master.

O. M. BLANTON'S VISIT THROUGH ARKANSAS AND TEXAS.

HOW THE COW-BOYS GET THEIR HONEY.

FRIEND ROOT:—I promised you that, when I returned from San Antonio, Texas, I would write you of what I saw that would be interesting to bee-keepers. I stopped on my way at Hot Springs, Arkansas, the great resort for the afflicted of almost all chronic diseases. I found it quite a city, nestling in the mountains, with handsome buildings, and a population of 12,000. After a week's indulgence in the hot baths, with great benefit, I left for Dallas, Texas, as one of the largest and most prosperous cities in the State; thence I went to Fort Worth, and on my way I saw the magnificent fields of wheat, corn, oats, and other cereals, which would have made you feel as though you were in the Miami Valley, but for the few hundred acres of cotton on those large farms. The farmers were harvesting wheat, and the harvesters and binders were in active operation.

From the phenomenal city of Fort Worth, of 15 years' growth and a population of 45,000, I stopped over at the beautiful city of Austin, and inspected its capitol, one of the grandest and most complete pieces of architecture in North America; thence to San Antonio to meet my children and seven grandchildren who were pleading to go home to Greenville, Miss. I had but four days to visit among the bee-keepers, and had a poor opportunity to inform myself. The honey prospect was very good, on account of the seasonable rains.

I met Bro. Flournoy. He had abandoned his large apiary on account of the previous dry seasons and the ravages of foul brood. Some of the comb honey I inspected was very white and translucent, and made in beautiful one-pound sections, and the extracted was of excellent flavor, and light amber. I was told it was from the "cats-claw" (*uña de gato*) family of the mimosa, which blooms in April.

From my observation, the honeys of Texas are of a very strong flavor, owing to the great fragrance of the flowers, and from that cause you soon tire of it for a table luxury.

Some few of the honey-plants I will refer to:

1. The *aiguila* blooms in February; extremely fragrant, and yields much honey for early brood; flowers small, in clusters, and of orange color. The berries are similar in color and size to currants, and of acid flavor, used in making jelly and pies.

2. The mesquite also yields much honey; and a singular feature about it is, that it rarely blooms in a rainy season, but flows abundantly in a dry one. It belongs to the family of *Leguminæ*, the beans of which the birds of every kind, and also cattle, feed upon. The beans are ground, and made into a kind of tortilla by the Mexican Indians, for food, when other means of sustenance are scarce.

3. The *lechuguilla* (pronounced lai-chu-geel-ya). It is a fiber plant, common on both sides of the Rio Grande, and as far east as the Nueces. The Mexicans use it for making rope. The flower blooms at the top of a tall stem, and is remarkable for the great quantity of honey it yields. It is of the yucca family. A gentleman informed me that, in riding through it, he grasped the flower with his buckskin glove on, and his hand was moistened from its nectar.

The wild heliotrope, Mexican willow, and hun-

dreds of other plants too numerous to mention in this article, yield honey, and most of the flowers are so fragrant that, in riding through the chaparral, you are almost overcome by the odor.

Southwest Texas is a great country for the bee-keeper, especially Uvalde County, except when the season is very dry, when the honey crop is almost a failure. In the mountainous parts of the Pan Handle (Northwestern Texas) bees are very abundant, and they are found in the caves and clefts of the canyons; and as the cow-boys' story goes, the clefts are so filled with honey that large combs project from them, and all they have to do to secure a sufficiency of it is to take a Winchester rifle and a bucket, and shoot off the comb and adjourn to camp for a feast.

Here at Greenville the spring opened favorably for a good yield, but the excessive rains now are a great drawback. My apiaries were much neglected last winter, owing to my absence from home, and I lost at least 60 colonies, and am now reduced to about 400. I found time in the spring to put them in good order and melt up a great portion of old combs—some, I am satisfied, were 12 years old. By this means I enabled them to make new comb for the queen to deposit her eggs in. I have so far secured only 8000 lbs. of honey, as much new comb had to be constructed; and my absence from home, and so many affairs to attend to, caused my apiaries to suffer.

O. M. BLANTON.

Greenville, Miss., July 8, 1889.

NOTES FROM MY WORK-SHOP.

DOUBLE-DECKED CELLS.

I BELIEVE it was Dr. Miller who lately called attention to the fact that bees sometimes build an extra tier of cells over the surface of a comb of sealed honey, after which the central tier was never opened by the bees. My surplus combs hang from the ceiling of my honey-house. Twice, once last fall and again this spring when robbers were particularly searching and energetic, I opened the doors for several days, and gave the bees free access to these combs until they were satisfied there was no more honey in them. In spite of this I found several combs containing honey in a central tier of cells, which they had not removed.

DAMPENING SECTIONS.

All sections that have been allowed to get thoroughly dry will break largely in folding unless they are dampened before using, no matter what some manufacturers claim for their peculiar mode of manufacture. I formerly dampened them by piling them up in layers, wetting the back of each alternate layer with a brush or sponge. This was tedious, and often injured the appearance of the sections. I now use a much better and more expeditious way, as follows: Take the crate of sections as it comes from the factory, and set it on the floor, or, better, put two sticks under it to raise it slightly. Take an old quilt or blanket, something that will hold a great deal of water, and wet it, as much as it will hold without dripping. Fold this closely around the crate of sections. A dry cloth thrown over the wet one to prevent evaporation will be a help. Leave them over night or for several hours, and you will find them damp enough to fold without breakage. It does not take much

moisture to toughen the thin film of wood where the bend comes.

T SUPERS.

I am using quite a number of these this year, and so far I like them very well, after making some changes. I did not like to have the sections held so far apart by the T tins letting them get out of square, and leaving great chinks for the bees to fill up with propolis. So I took the tins to the vise and flattened the fold until it was no thicker than the two thicknesses of tin. Perhaps they are not quite as stiff that way, but they are stiff enough. Then I cut the sides $\frac{3}{8}$ of an inch shorter, and, nailing them so that the inside length was slightly less at the top than at the bottom, I had a case that keeps the sections close and true, and avoids a great deal of propolizing.

GETTING THE LAST SECTIONS INTO T SUPERS.

Several devices for this purpose have been described and illustrated, I believe. Nothing better can be made than a piece of heavy tin the width of the section, or less, and five or more inches long. Bend it at right angles, $4\frac{1}{2}$ inches from one end, and nail a small block close to the bend, on the outside, to handle it by. Two of these may be needed. Their use is evident.

UNFINISHED SECTIONS.

Well, Dr. Miller, you have done it. I have been wondering for a long time who would be the one to make that point against the claim that sections filled with comb built the year before are unprofitable to use. We all know that, in producing extracted honey, empty combs are a very profitable to use, and it really seems as though the same principle ought to hold good with combs in sections. In my experience, though, it does not. Within the past week I have taken finished sections of honey, built on fresh foundation, from all sides of sections, filled with nice, clean, dry comb, nearly half of which were still unsealed, both put on the hive at the same time. Why is this so? Do the bees object to the small size of the combs, or does it simply take longer for them to ripen the honey put into the cells of full depth? The latter seems to me the better explanation. Perhaps if we should give the bees all the sections of comb that they could fill with honey, and then give them their own time to seal it after it was thoroughly ripened, we should find they would store as much or more honey than in sections where they had to build their comb. I confess I never tried this in just this way. This would be managing them on the extracted-honey plan.

With comb honey we very properly try to remove the honey as soon as it is sealed, while extracted honey should be left on the hive as long as possible. To produce extracted honey profitably, too, a much larger hive is needed than for comb honey. If we should allow a colony storing honey in combs no more room than is usually given to a colony producing comb honey, and not extract the honey from any comb until it was perfectly sealed over, should we get any more of extracted honey than we should of comb? I rather think we should not get as much.

I have experimented with sections of comb in various ways this year. I have used a great many bait sections, just as Dr. Miller advises, and I am willing to take back a part of what I have said, and admit that these bait sections often serve a very good purpose; and as there need be only a few of

them, it does not matter very much if they are not first class. I know of no better way to convince any one that sections of old comb are seldom if ever finished so as to equal in appearance those built new, than to use just this one bait section in each case, all others being filled with fresh foundation. Let such cases be filled during a good flow of honey from white clover, and any one with eyes can see the great difference in appearance. I am trying another experiment which I wish the readers of GLEANINGS could see in its progress. I have a number of Heddon cases, new style. These have seven single-tier wide frames, held together by screws on one side of the case, which we will call the front. The three back frames in each of these cases are filled with sections containing foundation put in them last summer, but little or not at all worked. The middle frame contains sections filled with comb built last year—nice ones, no candied honey or any thing objectionable about them. The three nearest the front are filled with sections of fresh foundation. Very often, as I pass about the apiary I lift the covers of these hives and note the progress of work in the sections; and it is very comforting to me to see in how many cases the three front rows are in advance of all the rest, although the row of combs in the middle has the best place, and it deepens my desire to have just as few unfinished sections as possible in the fall.

Dayton, Ill., July 10, 1889.

J. A. GREEN.

Thanks, friend Green. If you will turn to page 306 of GLEANINGS for April 15 you will see a diagram which represents the "double-decked cells," as you call them. We should like to know, however, whether the combs containing these cells are of ordinary thickness. If so, it is a rather unusual phenomenon.—Your method of dampening sections is rather novel; but in our climate we are of the opinion that the damp blanket would have to be around the crate of sections more than over night. If left long enough it would surely do the business, and you have our thanks for the suggestion.—As to the matter of putting the last section in the T supers, although we fill a great many supers for hives set up, we use no special appliance for getting the last section in. It does sometimes cause a little trouble; but a little shucking of the crate will usually cause it to slip into its place. The point you speak of, of a space between the sections, formed by the T tins, is one of the objections against the T super, as ordinarily made. The one-piece sections have a tendency to assume a diamond shape. When two of these sections lean in opposite directions from each other, we have noticed sometimes a space of nearly a quarter of an inch. The space formed by a T tin is usually just wide enough to cause the bees to chink propolis in between the rows at the top. This can be obviated, however, by using an extra set of T tins; and this extra set will at the same time hold the sections perfectly square.—On the matter of unfinished sections, we do not suppose there will ever be an agreement among the mass of bee-keepers as to whether their use is profitable. Our experience rather coincides with Dr. Miller's. Quite a number of our colonies would not go up into sections, although they were strong, and their brood-nest was

crammed full of honey and brood. From all such we removed one of the sections of foundation and put in its place a section of partly drawn-out comb. In most cases it had the effect of starting the bees above at once. Honey was first stored in the bait section, and then the bees gradually began upon sheets of the adjoining foundation. On others of our colonies we put in a whole row of unfinished sections, because they were not as strong as some others. Although the other rows contained full sheets of foundation, the row containing the unfinished combs of the previous year are the only ones to-day that contain any honey at all. In a heavier honey-flow, perhaps our experience would be reversed.

M. H. HUNT'S APIARY.

HIS ONE-STORY CHAFF HIVE, ETC.

THE cut shows only the central part of our apiary. The large hive is the center, and contains four swarms. It is made quite ornamental, and we all think it a very handy one to work with. The upper story is hinged, and self-supporting when tipped half over. The

Chaff hives suggest outdoor wintering, which we have always practiced, and, with the exception of the great honey-dew year, we have been very successful.

HUNT'S APIARY.

The grass in the apiary is always kept short; and to keep it down close to the hives, so the mower will cut it all, without hitting them, the sod is removed for a space of eight inches all around each one, and cinders packed in. As the grass sometimes grows through this, we are experimenting with water lime; and if it stands the winter without crumbling, we shall use it around and under all our hives.

We have always tried to make our yard attractive, and I think it pays in the satisfaction one feels in looking it over, and showing it to visitors. It also stimulates others to do likewise, which certainly helps our business.

We have sold both of our out-apiaries. We could not attend to them as we wished, on account of our increasing business. Our house and factory are a few rods to the right of the honey-house.

Bell Branch, Mich.

M. H. HUNT.

The apiary presents very much the appearance it did when we visited it a few years ago; in fact, a photographer, we fan-

HUNT'S CHAFF-HIVE APIARY.

rest of the hives (ninety in all), except five or six, are our new style, chaff in the lower part only. The upper part is movable; and when off it is just right to hang in brood or wide frames. Should you wish to get at the brood-frames when the sections are on, it is but a moment's work to remove them all at once. The brood-frames come up even with the top of the lower part. The space for surplus is 21 x 23 inches, and can be used for any kind of surplus arrangement that one happens to fancy. The upper part is made slanting in order to get the cover the same size as the lower part, making it more handy to pack and ship. The whole top is filled with absorbing material in the winter.

cy, might step into the yard at any time and take a picture, and friend Hunt would never have any regrets in having it presented to the public. We do not know whether he always keeps down the grass so that it presents the appearance of a nice lawn. If he does he does better than the most of us. Sometimes visitors call at our apiary, and we have to apologize because of the grapevines that have grown over the hives, and are sticking out in every direction, or because of the long grass that has not yet been mown. We generally get around it by saying we have been "so very busy."

Last year, when we had foul brood, we used to say that, as the apiary was a big expense, yielding almost no revenue, we hardly felt that we could put more money into it than was absolutely necessary. Friend Hunt's idea of keeping cinders under the hives to keep away grass is a good one, though it must be considerable labor at first. If the weeds come through, sprinkle a little salt where they start up. The cheapest way to keep grass and weeds away from the entrance is to sprinkle with salt. A couple of pailsful of rock salt will keep the entrances of a hundred hives clear for the season.

AMONG THE BEE-KEEPERS OF VERMONT.

CONTINUED FROM LAST ISSUE.

BRISTOL is a fine location for a crop of basswood honey, as these trees are plentiful on the hills and mountains. This crop is generally gathered inside of two weeks. In 1883 Mr. Manum's best colony gave 312 lbs. of comb honey. In 1885, when he obtained 19 tons of comb honey, and 3 tons of extracted, from 450 colonies, spring count, his best colony gave 228 lbs. of comb honey; and that season, at the Mills Apiary, near Bristol, his hive on the scales "gained in one day while working on basswood, 33½ lbs.; in 4 days, 123½ lbs.; and in five days, 179½ lbs."

White clover is more plentiful, and yields better on the heavy clay soil in the towns along the shore of Lake Champlain, and for this reason several apiaries are quite a distance from Bristol on the west and north, one being within a quarter of a mile of the lake, and 16 miles from home.

We visited all the apiaries but two of the most remote. All were of great interest to us, but we were especially pleased with the situation of the new one, apiary No. 6.

The valley is long and wide, large enough to give quite a meadow pasturage, white clover being plentiful 1½ miles away. On all sides, except the southwest, were high ridges on which basswood-trees were abundant. Here in an orchard on level ground, well sheltered from cold north winds, they were laying out the new yard.

At each apiary is a building containing work-room and honey-room, and one hive standing on scales. A piece of section on which the hive number is stenciled in black is tacked in the gable of each. Records of each colony are kept on a piece of section, or smooth piece of wood, which is left on the packing inside the case.

In some hives we found the records of several years giving dates of examination, when swarms issued, when requeneed, age of queen, etc., all kept in a kind of shorthand familiar to many bee-keepers. A book account of the important operations requiring special attention at a certain time is also kept in each bee-house. Hives are usually placed in rows 5 feet apart and 12 feet between the rows, when they face each other, and five feet between when back to back. In setting hives, a long line is used, the distance measured off, stakes temporarily driven, and a hive set against each stake and blocked up level. The packing is left about the inner hive the year round, and hives are not changed when once placed, unless to another yard. To prevent an upset during gales in winter, each hive is

tied by a large cord to stakes driven into the ground.

Most of the readers of GLEANINGS are familiar with Mr. Manum's three-legged, swarm-catcher, in the cage of which the clipped queen caught as the swarm issues is confined, and on which the bees cluster, and where they are left until there is plenty of time to hive them. Mr. Manum places the catcher so the caged queen is as near as possible to the flying bees; or if they have clustered, he pushes the cage into the cluster, or near by, and they soon find the queen and settle around her. If the swarm has gone some distance, or is in a high tree, the cage is stood up in front of the old hive. When they find they are without a queen they return, find her, and cluster with her. That they may surely cluster instead of going back into the hive without her, the hive entrance as well as that of one or two hives next to it is covered with a sheet.

Instead of carrying hives for the swarms, the latter are carried to the hives. A part of each swarm, about one-third, is shaken off in front of each old hive, and two or three of these reduced swarms with one queen are put in each new hive.

After the honey season, occasional trips to the out-yards are sufficient. Then where bees are very strong, and hanging out on the hive, new colonies are quickly and easily made without opening hives, by dipping off part of the bees and putting enough with a nucleus, or into a hive of comb having a caged queen.

The bees are mostly Italians. Some of the apiaries have a trace of Holy Land and black blood. The queen-rearing stock is selected out of this large number. Especially good stocks are set apart, and gradually culled down to a few of the best. We saw some fine queens here—good size, with thick and plump bodies, and darker than the usual type.

In the out-yards, the comb honey, when finished, is disconnected from the brood-nest, and remains in the outer case until cleared of bees. In the gable at each end is an auger-hole covered with a beelid, which, if properly arranged, allows bees to leave but not to return. In the honey season this usually works well; but when robbers are troublesome too much dependence is not placed on it, and there is on the inside a piece of wood or tin which may be turned around over the hole, and so all possibility of bees entering be prevented. The cover, which is fitted with a simple device, can be tipped back, and is held by a cord. This saves lifting. To hurry matters, the case is occasionally opened, and a few puffs of smoke given; this causes many to fly out, when it is again closed. When they are mostly out, the clamps are removed to the honey-room and stood in piles just as they are, except that the propolis is first scraped from the top and bottom to prevent them from being fastened together. There they are left until convenient for teams to take them to the home honey-house.

The crop at the apiary near the railroad is cleaned, crated, and shipped from there. In loading, the teams are backed up, the heads of horses covered with a coat or blanket to protect them from the bees, the honey is put in as quickly as possible, and covered with a sheet; the driver mounts the load; and as the horses are started, this covering is pulled off and the bees are soon left behind.

The home building is 16 feet by 34, and 1½ stories high. The upper part is used for storing fixtures,

while below it is divided into three rooms. On the east is the work-shop, fitted with desk, work-benches, and tool-racks; with doors opening into the apiary, and driveway with a stairway leading to the left. Next is the sorting-room, which receives through an outer door the clamps of honey. Here they are emptied, and the sections scraped, which are then stored in the west room, which is 16 feet square, and plastered. This has not been room enough to store the large crops, and much had to be left in store at the out-yards until room could be made. The small crop of last season had been shipped; but piles of clamps containing partly finished or empty combs occupied much of the room. When unloading, they back up to the door, quickly unhitch the horses, and get them under cover, and unload, if possible, before the bees in the home apiary realize their opportunity.

We noticed the hands were on the alert, and lost no time in getting the horses out of the way. The harnesses were made especially for quick work, snaps being used whenever practicable. The importance of this has been learned from experience. At Mr. Manum's farm, just out of Bristol, where he had planned to build a new home and move his home apiary, he has built a new honey-house and work-shop, 30 x 48 feet, two stories high, with a cellar basement. The sorting and storage rooms are to be very large, and each has a wide outer door opening into a shed, into which a team may be driven, horses and all, the doors closed, and honey loaded or unloaded at leisure, without fear of robber bees.

On the farm is another patch of Chapman honey-plants. Altogether he has about a quarter of an acre. He says the bees work on it all the time it is in bloom, and are wild over it; but whether it is best to plant it largely by the acre for honey alone, he is not sure. The plants are quite ornamental, four or five feet in height, and were then covered with round balls going to seed. He also had several patches of Japanese buckwheat, which promised much better than the ordinary kind.

Mr. Manum is interested in gardening and poultry, and he has a hen-house 65 feet long, 16 feet wide, and 1½ stories high, in which were Wyandottes, Plymouth Rocks, and common fowls. The house was conveniently arranged; and in the yards, by means of tubs and connecting troughs, he had arranged his summer watering-fixtures so that, by simply pumping a barrelful in the new building, each yard was supplied. This disposition to systematize work and invent labor-saving devices, is also seen in the hive-fixtures used in the management of the apiaries.

In 1877 Mr. Manum was engaged in the harness business, but was looking for another, on account of failing health. Mr. Smith, now of the firm of Drake & Smith, persuaded him that winter to read "Quinby's Mysteries of Bee-Keeping," which he lent him. He read and became interested, and that spring he bought two colonies; and by increase and purchase he had 20 colonies in the fall. A year or two after, he heard of Mr. Crane, whom he visited and found ready to give ideas which were of help. He tried the American hive and many others; changed and experimented, until by improving and combining he settled upon the hive and fixtures he now uses. He commenced with the 5-lb. box, with glass in one end; then on recommendation of Mr. Crane he tried that with glass on four

sides. Later, they together worked out many sections, crates, and other hive improvements.

The first section he used held about 4 lbs. They were made of pine, and nailed; later he used them holding 1½, 1¼, 2 lbs., and 1 lb.; and now he has discarded all but the 1-lb. box. He has tested the half-pound, and believes bees store honey in them just as well, but does not care to use them, as there are so many more pieces to handle, and make too much work.

We believe Mr. Manum was the first to make a white-poplar dovetailed section. His expenses the last three years have been quite heavy, with a very slight amount for the other side of the account, and affairs have looked somewhat blue; but he feels confident the coming season will be a good one. He fed, the past season, for winter stores, 28 barrels of sugar.

While there we visited the factory of Drake & Smith, who manufacture, as well as their celebrated white-poplar sections, a fine line of small-sized locked-corner boxes, having a sliding cover. They are also of poplar, and are turned out very white, smooth, and perfect. We saw the various machinery used, and were especially interested in that used for gluing and putting together the boxes. This firm also manufacture all kinds of hives and fixtures. Their foreman, Charles McGee, was one of Manum's hands in the apiary, and now owns 170 colonies, which he keeps in two yards, and leaves the shop to care for them during the swarming and honey season. His crop the past season was 1500 lbs. of comb honey.

Another firm in Bristol, Prime & Gove, also make very fine white-poplar sections, as well as hives.

We also visited the apiary of Mr. Edwin A. Hassetline, on a farm near Bristol. He had 75 colonies, and his crop last season was about 500 lbs. He runs the Bristol outer case.

After a visit both enjoyable and profitable, we left the home of those who had done so much to make it pleasant for us, and, by the kindness of Fred Manum, were driven to Middlebury to see Mr. Crane. Fred, a single young man of about 25, is the only son. He manages an apiary during the season, and helps his father at other times; but we suspect he cares more for horses than for bees. We were surprised to see the load of outer cases and hive stands which he managed to pack and pile up together on the double wagon, when they were moving. We did not ask the privilege of riding with him on the load.

Mr. Manum has since met with a great affliction in the loss of his wife, whose helpful sympathy and kind spirit made his home a home indeed. The news of her death, coming when we were expecting and hoping for good news, gave us pain, and roused our fullest sympathy for the husband and son. We shall always remember her kindness.

Pawtucket, R. I.

SAMUEL CUSHMAN.

To be continued.

Thanks, friend Cushman. As we have been following Mr. Manum very closely in his writings, your visit is of more than ordinary interest, because it details some things in regard to our good friend Manum and his work which he himself with rare modesty omits to say of himself. We feel as if we wanted to enjoy the privilege that you have had, of visiting this energetic Vermonter; and we trust that this hope may be realized

by one of the representatives of GLEANINGS in a year or so. We are impressed with Mr. Manum's system all the way through, and we are not at all surprised that he is a *successful* bee keeper. We admire his good sense in using snaps on harnesses wherever practicable, for facilitating hitching and unhitching his team to and from the wagon. We often wonder now why so many farmers and others will go to the trouble of winding a hold-back strap three times around the thill, and buckling, instead of making the same attachment instantly with a snap. In Mr. Manum's case it might save him the destruction of a wagonload of comb honey, and possibly permanent injury to the team itself. If our friend will adopt Mr. S. I. Freeborn's suggestion of using a draw-pin to disconnect the team from the wagon itself by a simple jerk with a chain or rope, he will have his harness rig very nearly perfect. On account of our recent mishaps in hauling bees we appreciate thoroughly all these improvements.

MANUM IN THE APIARY WITH HIS MEN.

MOVING BEES.

"GOOD-EVENING, Whittier. I have brought you a load of bees from Fred's yard. He is getting short of empty hives; and as you have a plenty here, I thought I might as well bring the bees here now as to move the hives. You will find there are but few bees in each box, as I have brought only what bees adhered to the combs after a swarm had issued. While the swarm was in the air he simply transferred the combs and adhering bees from the old hives to the moving boxes, and let the swarm return, to find nothing in the hive but foundation or empty combs. The honey season is so nearly at an end with him that I thought it better to get some more increase now than to keep them all in one hive and get nothing. I think they will both build up strong for winter."

"Well, I must say, Mr. Manum, that you have a very convenient box for carrying bees in."

"Yes, I like it very much. I can move full colonies in very warm weather, without danger of melting down the combs. Last year I moved 100 colonies 11 miles when it was very warm. You see how I have got it fixed. It is simply one of my brood-boxes with a thin bottom nailed to it, and a three-inch (high) rim covered with wire cloth for a cover, held in place by dowels and hooks. This forms a three-inch space over the frames for the bees to cluster, which relieves the combs of so many bees; and with 1½-inch holes near the bottom, covered with wire cloth, gives them a current of air, which is very essential in warm weather; and you will also observe that each comb is secure. They can not move, as each end of the top-bars is set in grooves, as well as the bottom-bar. They are so spaced that the box holds but 11 combs instead of 12, making a ⅝ space between each comb. Now, you see all we have to do is to set the box near the hive they are to be put into. Remove the rim-cover, shake the bees adhering to it in front of or in the hive, and lift out the combs one by one, and set them in the hive, and the work is done. My

wagon-box is set on springs made of steel rods, so arranged that the spring comes from the twisting of the rods. I first set 12 of these boxes on the bottom of the wagon-box, then this rack goes over them, and on the rack I place 12 more, making 24 swarms for a one-horse load. We carry 50 in the two-horse wagon, so that, when we wish to move an apiary, Fred and I with both teams can move 74 colonies at one trip. I must now go home and take off what honey there is finished up, as I want to get an early start in the morning; for I am going to drive out to Ferrisburgh to see how Leslie is getting along."

JULY 20.

"Good-morning, Ed. I just thought I would call a few moments and let old Bill take a rest awhile. I am going out to see Leslie, and it is quite a drive over these hills. How are you getting on requeening your apiary?"

"Pretty well. I have now young queens in all the hives that had two and three year old ones; but some of them are caged yet. I am to liberate the last lot to-day. You got those queens all right that I sent you, I suppose."

"Yes, sir; and they were nice ones too. What kind of candy is that that you use for queen-cages? Is it what they call the Good candy?"

"No, it is the Manum candy. I have used it for about ten years. It took me two years to get it to suit me—or at least to suit the purpose for which I wanted it. The beauty of this candy is, besides being a perfect bee-food, it will never dry up and become hard. I have kept it four years in an open dish, and at the end of that time it was as good as newly made candy. I kept the secret to myself until three years ago, and then I told only one man how it was made; but within a year I have told several."

"Then you have no objection to telling me, have you?"

"No; I am willing all should have the formula now, and here it is:"

MANUM'S QUEEN-CANDY.

Take 8 spoonfuls of coffee A sugar; 1 of wheat flour; 1 of glycerine; 2 of granulated honey.

"First thoroughly mix the flour with the sugar, then pour the honey and glycerine in a tin dish; then the sugar, and set the dish into another larger dish partly filled with hot water (I use an ordinary glue-pot); set it on the stove and let it simmer until the sugar is dissolved, then remove to cool, when it is ready for use. If the honey is thin it may be necessary to add more sugar or use less honey."

"Now one word before I go. Be very careful about exposing honey after the bees stop getting it from basswood, and that will be very soon now. When you notice them hanging around the honey-house it will be a warning to you to be very careful, as it will take but little to set them to robbing."

"How do you do, Leslie?"

"Good-afternoon, Mr. Manum. You are quite a stranger here."

"Yes, I have rather neglected you this year; but the truth is, I have had my hands full since the season commenced; and besides, I felt perfectly at ease, knowing that you would do as well without me, as you have worked at the bee-business long enough now to be thoroughly posted."

"Well, I have done as well as I could; and by corresponding with you often I have got along pretty well so far."

"Well, Leslie, I have brought you something

new. You know I have been experimenting for a number of years with queen-nurseries, and never fully succeeded in getting one that suited me. The little tin incubators I made four or five years ago work very well, but I am always worrying for fear they will set the building on fire. But the other day I hit upon a nursery that works to perfection, and here it is.

MANUM'S QUEEN-CELL PROTECTOR.

"Simply a frame filled with little boxes which have a wire-cloth cover. You see, my frame takes just 32 of them, but I prefer a half-frame holding 16, like this one. All you have to do is to hang the cells on these tin points, and hang the frame in an upper story in place of a comb, and let the queens hatch; or if you prefer you can hang the nursery in the body of the hive under the sections, but it is handier to get at in an upper story. I have now eight of these nurseries filled with cells, in my home apiary, and one to each of the other apiaries. I am making more as fast as I can, so all can have five or six.

"I want you to be sure to discard all queens over one year old, unless you have one or two very extra good two-year-olds that you will want to breed from next season. I am thoroughly determined not to winter any queens older than one year."

"Well, that is just what I am doing; and you will find I have not increased the number of colonies in this yard very much. When a two-year-old queen swarmed out I killed her and let the swarm go back, and I kept the cells cut out until they had nothing to raise a queen from; and now I am giving them virgin queens as fast as I can hatch them; and by giving them plenty of room in the boxes I find they work quite as well, but more especially after I have given them a queen."

"Yes, after you give them a queen they carry up the uncapped honey from below to make room for the queen to lay. I am teaching Scott and Fred this year how to run them in this way—especially those colonies that have cast a swarm—by keeping the queen-cells all cut out until the brood is too old to build more; and in 16 to 18 days after the swarm issued, give them a virgin queen. There is no danger then of second swarms, and it is a very easy

way to requeen an apiary from choice stock; and by the help of these nurseries it will now be nothing but fun to hatch queens. Well, I have made you quite a visit; and as I see nothing out of order here, I will hitch up old Bill and start for home."

Bristol, Vt.

A. E. MANUM.

We are interested in your bee-candy. We suspect that one of the elements which contributes to the success of your candy is glycerine. It is this, doubtless, that keeps it soft so long. Just now we are making the Good (or Scholz) candy as follows. We select some of the very nicest alsike or bass-wood honey that we have in stock. This we heat until it becomes quite thin. To this we add confectioners' powdered sugar, and knead it into a stiff dough. But this candy, if allowed to stand awhile, will run and become soft. To prevent this we add common powdered sugar, kneading it over to make as stiff a dough as possible. We have found that a mixture of the two sugars gives better results than either one alone, and our losses in bees and queens sent out have been reduced to a very considerable extent, so that now we scarcely have reports of bees dying, even during hot dry weather, most unfavorable for shipping bees. Well, now, may be your candy is better yet. We are going to give it a test at any rate.—We received your sample queen-cell protector, and instructed our engravers to make a full-sized engraving of it. The tin which supports the cell is shown in front of the cage. It is passed through the little slot shown on the top of the cage. The wire cloth is made to slide in a groove, so the hatched queen may be easily taken out and another cell put in the place of the one now empty. The principle of the queen-cell protector is about the same as that illustrated and described on page 201 of Alley's Beekeeper's Handy Book; and, as nearly as we can judge, Alley's queen-cell protectors are used very much on the same plan. Such a queen-hatcher works well, and we have tried them considerably.

MUD-WASPS, SNAKES.

FRIEND COOK:—I send you to-day a nest which I first thought was a wasp's nest; but on investigation I found it full of spiders. I found it in the upper part of a hive. Will you kindly describe it in GLEANINGS?

Fremont, Mich., July 2, 1889.

W. E. GOULD.

Prof. Cook replies:

The nest is that of the mud-wasp, probably some species of *Sphex*. These wasps have long peduncled abdomens, and are interesting in that they do not kill the insects which they furnish to their yet unhatched larvæ. I have often found live spiders entombed in these clay sepulchers. The wasp paralyzes the insect, spider, etc., places it in the mud cell, lays an egg on it, and seals all with clay. When the wasp egg hatches, the young or larval wasp feeds on the still living food prepared by its parent.

COPPERHEAD SNAKES.

I wish to thank GLEANINGS, for through it I have received from J. R. Atchley, Arlington, Texas, a beautiful copperhead. This, though very poisonous, is really one of the most beautiful of American

snakes. I am delighted to get it. Though sent in a close box all the way from Texas by mail, it came safely, and was lively upon arrival. I should like to get the other Southern snakes, especially the moccasins. I would pay for expense and trouble. They can be sent at my expense. I am told that it is unlawful to mail them. A. J. Cook.

Agricultural College, Mich.

A GOOD YIELD.

ORGANIZING A CONVENTION.

I HAVE secured two tons of comb honey, and extracted three and one-half tons, making 11,000 lbs. All of it is clover, except some that is mixed with linn. Prospects are good for more honey yet. I have increased from a trifle over 120 colonies to 195. My bees are all Italians; but as soon as I can find time I expect to experiment with Carniolans, but more for amusement than in hopes of finding a better bee than the Italian.

What is to prevent us bee-keepers of Western Missouri and Eastern Kansas from having a rousing convention in the fall? Doesn't it look too bad to have such a host of bee-keepers in a good honey-producing country, and never a meeting of any kind! We could meet at some town that has the proper conveniences, without very great effort; and if it is not too soon I would suggest that we have a convention at Higginsville, where, I'm satisfied, we could be furnished suitable accommodations at a great deal less expense than at Independence or Kansas City. I am satisfied that, if we would try, we could get up a convention that would be of assistance to us in the way of giving us a chance to shoot off our ideas, and air them a little.

PREVENTION OF SWARMING.

I found a cure for swarming this season by removing most of the capped brood and replacing with empty combs. This plan, if used with judgment, will not interfere with work in the sections, and will prevent swarming if care is taken and plenty of room given as it is needed; but unless you have weak colonies or nuclei to build up, you will increase some, which, if not wanted, can be doubled back into the hives as fast as the bees hatch out of the combs. R. L. TUCKER.

Lexington, Mo., July 4, 1889.

BEEES BITING HOLES IN CAPPINGS.

VALUABLE SUGGESTIONS FROM DOOLITTLE.

I HAVE read the different articles written by friend Manum, in late numbers of GLEANINGS, with much interest, and I find that his mode of working for honey corresponds very nearly with my views on the subject. There is one little item which I wish to notice, however, which must be either a mistake of the typo or else Mr. Manum must have fallen into an error, according to my experience. On page 535 we find him saying to Scott, "No, no! don't smoke them, as that will cause the bees to bite holes in the cappings and spoil the looks of the honey," while a few paragraphs further on, Scott says that the scale hive showed the day before a gain of 18 pounds of honey, so that we infer that honey was coming in very plentifully at the time friend Manum fears that the bees will bite holes in the cappings if the bees were

smoked. Now, according to my experience those bees could not have been smoked enough at that time to make them bite into a single capping; for when bees are getting honey at the rate of 18 pounds a day, nearly every bee is as full of honey as it can well be, hence could have no desire to take more honey, even if it "lay around loose." At such times as this it is only fun to get the bees out of sections, for they are so heavy with honey that a little shaking will cause them to rattle off the combs like beechnuts off a tree when they are fully ripe. Here is a point in bee-keeping which I have never seen noticed that I remember of, which is, that the same number of bees will occupy nearly double the space when honey is coming in plentifully that they do in a time of honey dearth. During our peculiar season, the present year, the bees were nearly starving just before the basswood bloom; and as but little brood was reared 21 days before basswood opened, there were but few bees hatching to replenish those in the hive; yet when they began to get honey from the basswood, the bees which before occupied only the brood-chamber to the hive so expanded that they now filled nearly as much room in the sections as there was in the brood-chamber, or double the room they did a few days before. I do not believe in smoking bees any more than do Messrs. Manum and Root; but in all of my experience I have never had holes bitten in the cappings to honey except in times of scarcity, and in such times it is hardly possible to get the bees off section honey without their doing more or less of this work, unless they are immediately shaken off the honey, or driven down into the hive before the sections are removed.

DISTURBING NUCLEI.

On page 533 I see that friend Root was annoyed when raising queens in upper stories by having to disturb his nuclei in the upper hive every time he wished to get to the lower one, and thinks that this is an objection to my plan of working. To overcome this difficulty I tack the queen-excluding honey-board lightly to the bottom of the upper story or hive, so that at any time when I wish to get to the brood-chamber all I have to do is to lift off the upper story and set it to one side, the same as I would do were there no queen-excluding honey-board between the two, nor any queen-cells or nuclei about the hive. When doing this the upper cover is not touched, hence this upper hive is really not disturbed in the least in getting at the brood-combs below. Perhaps it would not be more than right for me to say that, during the time of scarcity of honey, and when it was coming in very slowly from clover, I did not have my usual success in getting queens fertilized in upper stories, so I fear that this part of the plan, as given in my book, may not work with all, especially those who do not have a heavy honey-flow at any time during the year. As I had in previous years sold myself short of bees, and used so many from my stronger colonies to start the queen-business early, I did not tier any hives for extracted honey till into the basswood bloom, hence I had an experience with it only in the height of the honey-flow and afterward. Now that the basswood is in bloom I am having success again. The queens were allowed to hatch as usual before basswood; but when they became three or four days old the bees would begin to persecute them, which finally resulted in their death, and in one or two instances in a general row "upstairs,"

in which many bees were killed. It may also be that the reason lies in the fact that queens are more easily superseded the latter part of the season, that being the time in which the bees do the most of this work where left to do it themselves.

While this part partially failed, the getting of nice queen-cells above the excluders was a perfect success, even when the bees were living only from hand to mouth, as not a single failure occurred.

PREPARING FOR WINTER.

Perhaps some will think there is time enough to talk on this subject three months from now; but I wish to say that I have found that August is the month in which we lay the foundation for our success or failure in wintering bees. All colonies should be reinforced and made strong during this month, or in the breeding, not in the fall. If any queens are old and feeble they should be superseded at once, and not wait till into September, for the eggs laid during this month are to make the bees which are to go through the winter—yes, and those that are to do the work the succeeding spring. I had my eyes opened considerably on this point this year. Last year I bought some hybrid bees, one colony of which were nearly black. Into this I introduced an Italian queen the 20th of August; and as she did not breed very much last fall, of course the bees going through the winter were mostly hybrids. I watched this colony very closely, and you can see that I learned something new when I tell you that there were quite a number of nearly black bees going in and out of the entrance July 4th of this year; hence these bees were nearly if not quite ten months old.

G. M. DOOLITTLE.

Borodino, N. Y., July 16, 1889.

FOUNDATION VERSUS COMBS.

IN FAVOR OF EMPTY COMBS IN THE SURPLUS APARTMENT.

AS Dr. Miller desired a statement from different bee-keepers as to their success with sections filled with old combs left over from the previous yield, I herewith give you my plan: I always have more or less comb left over from year to year. In the fall of 1884 I had 3000 sections partly filled with honey. It was extracted or fed back to the bees. In 1885 there was no honey; 1886, clover yielded enough to rear large quantities of brood, so the 25 old stands swarmed in June. I sandpapered my sections and scratched off the end of the cells $\frac{1}{2}$ of the way down to the base, and put them on the 25 new swarms. As fast as the bees hatched in the old hive, the bees were brushed off into the new swarm, leaving just bees enough to care for the young queen in the old hive. Basswood opened July 10, lasted 14 days; and those 25 new swarms gathered and stored 3000 lbs. of basswood honey in the 14 days, all sealed. I had over 1000 partly filled sections which were extracted. The old combs looked as fine and white as those just drawn from foundation. In 1887 we had no honey, and not much in 1888. This year I had 30 Heddon supers filled with sections containing old combs. I went through the former method, excepting that I filled a good many crates alternately with old combs and one with foundation. They are still on the hives. The combs are filled with honey, and sealed, while the foundation is fairly worked out with some honey. Some of the old combs are worked away out into

the next section of foundation. I use no separators. I prefer giving supers of foundation to heavy swarms which will immediately occupy them. Basswood will now soon open. It is just loaded with buds.

J. R. REED.

Milford, Wis., July 10, 1889.

Your testimony is strong in favor of unfinished sections. See our remarks at the foot of J. A. Green's article, in the current issue.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

THE DOVETAILED HIVE JUST THE THING.

THE hives and other goods came all right, and in splendid shape. You beat the world on fine goods at low prices. The Dovetailed hive is just the thing to put bees in; and the section-holders are the nicest arrangement for the double chaff hive, better than a crate. Ten holders put crosswise fill the bill, and a person can get them out easily.

SHIPPING BEES FROM NORTH TO SOUTH TO CATCH THE HONEY-FLOW.

If nothing happens to prevent, I want to go to Florida this fall with 200 swarms of bees to catch the honey-flow from orange-blossoms. I have been thinking about the Dovetailed hive ever since it came out. I have been shipping bees in light cases, and I came to the conclusion that I would have the Dovetailed hive shipped in the flat. But since I saw your letter, explaining how it could be used to ship bees in, I think it is just the thing to kill two birds with one stone. You may think I am wild, but I am not. If bees can be shipped from the South in the spring, and do better than bees wintered here, why won't the rule work both ways? They claim the trouble is to get bees ready for the orange-blossoms. I am going to take them there ready for work.

C. E. JONES.

Delaware, O., July 11, 1889.

Yes, sir, friend Jones, the Dovetailed hive will be just the thing for shipping bees from north to south. We should be glad to have you report the success of the enterprise.

WHY THE BEES WILL NOT RAISE A QUEEN.

Please unravel the following knotty and to me mysterious behavior on the part of a colony I have. They cast two swarms, and afterward lost their queen (I saw her after she was hatched). I presume she was lost in her wedding-flight. The hive has remained entirely free from eggs or larvæ, showing the absence of even a fertile worker. I gave them a frame containing eggs, which they either destroyed or ate up. I then gave them a queen-cell which they tore open and demolished. I then gave them a frame containing eggs, larvæ, and sealed brood. The eggs were destroyed, and the larvæ, I think, sealed up; but no queen-cell made—we can not find a queen in the hive. All the frames are filled with honey, save the one with brood, I gave. Would it do to give a queen, or break up the colony and combine with other colonies? We can not find any thing bearing on this case in the A B C.

W. B. ROHMER, M. D.

Bay St. Louis, Mo., June 12, 1889.

It is not at all unusual for bees to refuse to

accept a queen, after they have failed one or more times in raising one. I should think it quite likely they had something among them that they treated as a queen; and though she never lays eggs of any kind, this bee will be the ruin of the colony if she is not put out of the way. Treat them exactly as you would a case of fertile workers. Give the colonies several frames of brood, with bees adhering, or unite them with a weak queenless colony, which amounts to the same thing.

BURR-COMBS; CAN THEIR ATTACHMENTS TO THE SURPLUS APARTMENTS BE AVOIDED WITHOUT THE HONEY-BOARD?

Can we make our new hives so as to discard the honey board and not have burr-combs built between the brood-frames and section-case? If not, why not? Yes. By making the top-bar $1\frac{1}{2}$ wide by $\frac{1}{2}$ thick, and closing them to $\frac{1}{8}$, you will not have any more dauby messes by tearing off honey-boards, nor will you have any burr-combs built between the brood-frames and the section-case. I used this kind of frame last year, and this in about 80 colonies, and I have yet to find the first bit of burr-comb between. It brings the sections close to the brood-nest, and the bees are quick to enter them.

A. L. KILDOW.

Sheffield, Ill., July 8, 1889.

We do not know but there is something in what you say, friend K. We have a hive out in the apiary, with top-bars $1\frac{1}{2}$ inches wide, and spaced $\frac{3}{16}$ inches apart. Although there are fewer burr-comb attachments to the cover it does not prevent them entirely. It has been claimed before, that top-bars one-half or even a full inch thick, and $\frac{3}{8}$ wide, will do away with burr-comb attachments. We should be glad to hear from others on this point.

A 5-CENT PACKAGE OF JAPANESE BUCKWHEAT, AND WHAT IT DID.

Please find inclosed 17 cents, for which send me some Japanese buckwheat and one bee-brush. I planted the 5-cent paper you sent, early in the spring, and saved about a quart of seed. I planted that the first of June, and it is now in full bloom, and very attractive to the bees. I wish to plant some more; and if I wait until the seed matures I fear it will be too hot and dry. I think it is the first buckwheat ever grown in this part of the State, that is attractive both to people and bees. I also have a few of Simpson and spider plants, which the bees do not notice. Mignonette, bee-balm, and bee-clover they are continually humming over.

MRS. ROSE RILEY.

Columbus, Tex., June 23, 1889.

COMBS BUILT CROSSWISE OF THE FRAMES; WHAT TO DO.

The first of last month I obtained three swarms of bees from a neighbor, the first swarm I had ever seen. I put two of them in Simplicity hives; the other was put in a box hive with the intention of transferring it. The trouble is, with the Simplicity hives, the frame in one of them got out of place in some manner, and they have built their combs between the frames attached to the slatted honey-board, so that I can not take a single frame out. The frames in this hive had starters in them, and were contracted to six. The other one had no

starters in, but the full number of frames, 10. The bees, instead of building their comb to the comb-guides, built to the space between the frames, so that none can be removed except two on one side that have not been built on yet. Would you advise me to take out part of the frames containing honey, substituting frames of foundation? I want to put Italian queens in them. There is nothing in your book so indelibly stamped on my memory as your advice about starting with a few colonies. There are several small things I have learned, that, had I had several colonies, might have been costly lessons to me.

J. C. SINGLES.

Strickersville, Pa., July 6, 1889.

We should think, from the account you give in your letter, that in one case your frames were improperly spaced. In the other case they were jarred out of position, as you say. Either one would cause combs to be built crosswise, or in between the frames. We would advise you to pull the hive apart, having previously given them a good smoking. Select the cards of comb that have brood in; put them into frames, and fasten them with transferring-clasps, or in any of the ways that are usually adopted in transferring. The combs containing only honey had better be used up on the table as chunk honey. The rest of the space fill up with frames of foundation. Be sure next time to space each frame so their common centers shall be $1\frac{1}{2}$ inches apart. The tips of the fingers, shoved between the top-bars, will usually make the right spacing.

DOES IT PAY TO FURNISH ALSIKE SEED FREE TO FARMERS WITHIN A MILE AND A HALF OF THE APIARY?

I have something over 70 stands of bees. I have an offer from some farmers within a mile of me. They say they will sow all the alsike clover seed that I will furnish. The question is, will it pay?

Sabina, O., July 6, 1889.

N. SHUMAKER.

It is a hard matter to answer your question by a direct affirmative or negative. Perhaps we should say this: That we are in the habit of furnishing alsike clover seed, free of charge, to farmers within a range of a mile and a half of our place. In like manner we furnish the buckwheat. A good deal depends upon your locality as to whether it will pay, and the amount put out. One of our bee-keeping friends—a Mr. Chase, in a neighboring town—buys his alsike and sells it to the farmers at a reduced price. We believe he has within range of his bees something over 100 acres of alsike. Of course, where a bee-keeper is able to sell the seed to the farmers, the question as to whether it will pay or not is not so hard to settle. Generally speaking, however, we think it does pay to furnish farmers within a mile and a half of the apiary as much alsike seed as they will sow.

BEEES TOO NEAR A HIGHWAY; HOW TO MOVE THEM BACK.

I live within five steps of a turnpike road, and my bees have been a source of great annoyance to people passing. I have been very uneasy in handling my bees, for fear they might make some horse run away, and do damage. So great has been my

fear that I have not been able to do any thing with the bees. I ought to cut out queen-cells and do a great many other things, but I dare not for fear of the annoyance to passers by. I have had a notion of moving them back about 50 or 60 yards, but I did not know whether I could do it or not. My bees have been unusually cross this year, on account of rainy and cool weather, and at this time of writing they are most of them clustering in front of the hives. They have been dragging out drones for two weeks. If you think I can move them back without any great loss, please tell me how. If I can move them, when would be the proper time. This fall or next spring? I leave bees on summer stands all the winter. G. W. REAME.

Franklin, Tenn., July 3, 1889.

Under the circumstances we would not advise you to keep your bees in their present location. You had better move them to the back part of your lot, at least far enough from the highway so that no annoyance can occur. It is not usually possible to move bees a short distance without some inconvenience or loss; but if you have only a few colonies I would advise you to move them all back at night, at once. Change the appearance of the old location, and make every thing look as strange as possible. At the same time, make the new location resemble as much as possible the old one; at any rate, put each hive in the relative position it occupied on the old location. If the bees should cluster on the ground near the old location, scrape them up, mix them together, and make a nucleus or colony of them, and take them back among the other bees. For further particulars, see "Moving Bees," in the A B C of Bee Culture. Also see R. Powell's article in GLEANINGS for July 1, p. 531.

A VARIEGATED CALIFORNIA GARDEN.

Few people who plant gardens for beauty are aware of the great number of plants with variegated or odd-colored foliage. True, we have many plants which are almost constant bloomers, but a plant with beautiful foliage is itself a flower which lasts through the entire season. Do you wish to plant fruit-trees in your garden? Our beautiful purple-leaved prunus, *Pissardi*, bears a very fair plum; and the fruit of the peach-tree with purple leaves is by no means to be despised. Here in California we have evergreen orange, lemon, and lime trees, whose leaves are most beautifully marked with yellow, white, and green. Some of my apricot-trees are gray with light and dark green variegation.

You can have corn (*Zea Japonica* var.), and lovely foliage beets of half a dozen varieties. Our Chilean beets have been as much admired as any thing we have in our garden. We raised our abutilons, with their beautiful spotted green and yellow leaves, from cuttings. They rooted readily, and in four months were blooming profusely without a drop of water from the time I planted them. I think our dry summers heighten the variegations. I paid a dime for my *Althea* var., but its yellow-white and green leaves are not so pretty as those of the *wiegela* or the very showy *euonymus*. The *wiegela* grows easily from cuttings too. The purple-leaved *filbert* which I bought proved to be plain green; but the purple *barberries* keep their colored leaves the whole year. We have rubber-trees of the glos-

siest evergreen; but when my wife learned that there was a variegated *Ficus elastica*, the glories of the others were faded. Our beautiful green *dracena* was forsaken when I brought home one with red leaves, and our common maples looked faded beside the varied foliage of their Japanese cousins.

Our spotted callas suffer from want of water, and our sun is too hot and dry for the *caladiums*, *crotons*, and the half-dozen kinds of *coleus*. I think the last will do fairly well when it is a year old. *Tradescantia multicolor* fades in our hot sunlight.

Nothing is prettier of its kind than the old-fashioned ribbon-grass; and it stands drouth and heat very well, and keeps fresh all the year with me. My *Eulalia Japonica* looks very much like it; but the *Eulalia zebryna* is an oddity, for its stripes go across the leaf. No other plant is thus marked except one other from Japan (the *Scirpus*).

But if I should tell you all about my acalphas, *alternatheras*, *aloes*, *amaranthus*, *stevia*, etc., brother Root would surely say, "Waste-basket," so I will just wish, in closing, that you could see our *geraniums*. Their leaves are gorgeous, and they stand drouth better than almost any other plant, unless it be the variegated myrtle, or *vinca*.

Springville, Cal.

C. M. DRAKE.

EXTRACTING FROM YOUNG SWARMS, ETC.

(1) Do you think it would be safe to extract honey from the frames of the young swarms, after the 1st of August, providing they have plenty of honey?

(2) Do you think bees could be moved a mile at this time of year without their going back to their old location?

F. N. PERDEW.

Henry, Ill., July 18, 1889.

(1) You can extract from surplus frames, but we would hardly advise you to take any from the brood-nest. In most localities, or at least in our own, there is very little certainty in getting very much honey after the first of August. It is safer for beginners to leave the brood-nest alone. If you get a good fall crop, give the bees empty combs in which to put it. These sealed combs will come very handy for distributing stores just before putting bees into winter quarters.

(2) Most of the bees would stay in their new location, although doubtless some would return to their old stands. If you move them a mile and a half, we should expect very little going back; two miles, ordinarily, none at all. If you move them a mile, change the appearance of the old location as much as possible, and in the new location put the hives in the same relative position they occupied formerly. See answer to G. W. Reame, in the opposite column.

CLOSED-END FRAMES; FRIEND HEDDON'S SUGGESTION ON P. 536 BEING TESTED.

I notice on page 536, July 1, that Mr. Heddon has exactly described the hive I am using. I never liked the beveled edge nor the Heddon L. hive with the bottom-board fastened, so I made a hive with a bottom-board and cover the same as the patent Heddon. The brood-chamber is 18 x 11½ x 9 in., which holds 8 frames, the closed end resting on the strip of tin extending in ¼ inch on the bottom end of the hive. This is a reversible frame or hive. I use two of these stories on strong colonies for extracted honey, and a super with sections on top. This hive has given me the best satisfaction of any

I have tried yet. I can winter bees better in this hive than in any chaff hive ever made; in fact, for wintering bees outdoors I would rather buy the above hive than use chaff hives furnished free. I use a single brood-chamber of soft pine, unpainted, for wintering, which is inclosed in another hive one inch larger, or, rather, with an inch air-space between, which gives me a double-walled hive with one inch of dead-air space all around. My bees are always strong in spring, and breed up early. This and the Heddon hive are the hives of the future.

Clarion, Pa., July 12, 1889. J. T. FLETCHER.

PURE ITALIAN DRONES; IS THE DRONE ONLY THE SON OF HIS MOTHER OR NOT?

Is the question settled beyond dispute, that a queen of pure Italian pedigree, but mismated, produces hybrid drones, or is it still open to positive proof? I know that several well-known breeders hold they are hybrids, but that's not proof. I am interested in the mother, for the other day I found a young Italian queen, without wings, laying, of course, nothing but drone eggs, and the drones were the brightest of any in the yard. Now, if those drones were good, why should they not be equally so if the queen could have flown and been mismated?

H. F. HART.

Avery, La., July 6, 1889.

It is commonly supposed that the drone is the son of its mother only; but G. M. Doolittle and one or two others have ventured to question this statement. Our experience and observation, however, have rather tended to sustain the statement of Dzierzon and Berlepsch, that the drone has only one parent. Here is a chance for careful experimenting.

THE FOOD COMMISSIONER SEEKS INFORMATION IN REGARD TO ALLEGED ADULTERATED HONEY.

Mr. A. I. Root:—Cleveland papers charge that parties are manufacturing an entirely artificial honey-comb from paraffine, then filling it with glucose, and selling it for pure honey, although there is no part of it the product of the bee, or, at least, not more than to give it flavor. I have looked the markets through somewhat in this city, and talked with men who seem to be conversant with bee matters, and I can not find, thus far, any foundation for the articles in papers. It is claimed here, however, that bees are sometimes fed glucose or cane sugar, and an inferior article of honey is produced, also that glucose syrup is added to strained honey. I am anxious to lend any assistance in my power to the consumers and producers of honey, and write you for information. Do you think that honey made from or by bees fed on sugar or glucose could be called adulterated? and do you know whether there is any truth in the charge made in the Cleveland press? Can it be done successfully? and have you any means of knowing if strained honey is being adulterated with glucose? and if so, who is doing it? The whole subject is new to me, and any thing that you may say will confer a favor on all honest producers.

F. A. DERTHICK,

Food Commissioner of Ohio.

Columbus, July 13, 1889.

Upon receipt of the above we replied as follows:

Mr. F. A. Derthick:—As we notice you are the Ohio Dairy and Food Commissioner, we take pleasure in answering your kind letter of the 13th inst.

We inclose you half a dozen cards, offering \$1000 for samples of manufactured comb honey. These cards will give you the whole status of the thing in a nutshell. This offer has been out now for two years; and although we have distributed thousands of them, and although the same has been published in a number of newspapers, no one has even taken the pains to write us that he could fulfill the conditions of the proposal. We also send you a sample copy of our journal, "GLEANINGS IN BEE CULTURE." Please read the article on page 543.

In regard to feeding glucose to bees, we would say it *can* be done, but it would not pay to do so, because it would cost more to get the bees to put the stuff into their nice combs than the bogus article would bring afterward on the market, even if sold at the price of A No. 1 honey. Liquid or extracted honey may be adulterated, but usually there is not enough money in it to do it. When good pure California honey can be bought for 4 or 5 cts. per pound by the carload, it is not at all likely that dealers would go to the trouble of adulterating it with glucose, an article which costs nearly or quite as much per pound. Notwithstanding these newspaper stories to the contrary, you will see that plain common sense, and the application of a little arithmetic, show that very little honey is adulterated. We should be glad to have you use your influence in removing the ban of suspicion from honey.

THAT TESTED QUEEN.

The first queen (tested Italian), received from you May 14, was accepted May 15; introduced to a two-frame nucleus of young blacks. She got down to work in short order, and to-day \$10.00 would not buy her. She has ten frames full of mostly capped brood, and the colony is large enough to swarm. They are always working, while the others lie idly about. The last two queens received from you came in fine order. I introduced by dropping into full colonies immediately after catching the old queen. I can always tell by the way the bees act whether all is well. One came out and flew around four times, and doubtless would have been flying yet, but I caught her and clipped a wing, and that settled it. This has been

BY FAR THE BEST SEASON

we have had for some time, and honey has been produced by the ton. Just here harvest is about over, and drones are scratching, but the Italians are very busy. In the timber, however,

FIREWEED

is at the best, and bees are very busy. Oregon is slow to adopt modern appliances, and but few enthusiasts are to be found; but as the State fills up we shall be able to give better reports.

Portland, Or., July 11, 1889.

E. J. LADD.

JAPANESE INFERIOR TO SILVERHULL BUCKWHEAT FOR HONEY.

Well, Uncle Amos, I have just come in from the buckwheat. It is in full bloom, and there are ten to one more bees on the silverhull than on the Japanese. It was so last year on my place; but the Japanese was so boomed through GLEANINGS I thought I would hold still for a while; but when the same thing occurs again with the two kinds side by side, on the same kind of ground, I wondered if the booming had not been a little strong, in order to sell the stuff. The Japanese stands up some better and gives longer, larger grain, and will

bloom a little longer, and perhaps yield a few more bushels per acre; but as a honey-plant, with me the silverhull is far ahead. The 500 sections came to hand all right.

J. W. C. GRAY.

Atwood, Ill., July 10, 1889.

Your experience doesn't seem to agree with others'. The Japanese, according to most reports, has fully equaled the other buckwheats as far as the yield of nectar was concerned; but in grain yield, in every case it has been vastly ahead. We should be glad to hear from others as to the comparative yields of nectar.

TO GET THE BEES TO CAP THE TOP ROW OF CELLS.

I can't get my bees to cap the top row of cells in the sections which are in T supers. What can be done to remedy it? I couldn't find any thing about it in the A B C.

C. F. MCCOLM.

Lexington, Ill., July 10, 1889.

We sent the above to Dr. Miller, who replies as follows:

The T super differs in no respect from wide frames or other receptacles with regard to finishing sections. The upper part of the section is sealed over before the lower; but as a general rule the row of cells adjoining the wood at top, bottom, and sides, remains unsealed. Sometimes they are filled with honey, and sometimes left empty. I do not know what the conditions are, to secure the complete sealing of this outside row of cells, and I shall be glad to hear from any one who does. Perhaps a heavy flow of honey and a somewhat crowded condition in the hive is all that is necessary; but the majority of sections have this outside row of cells uncapped, whether raised in T supers or what not.

Marengo, Ill.

C. C. MILLER.

WINTERING QUEENS IN NUCLEI.

Is it possible to winter queens in three-frame nuclei, such as I have ordered, to have for building up in spring? A B C and Root's Quinby do not mention it. Is it now too late, if possible? My single box colony has grown to 6 very good ones; 2 are rather strong, and working in the sections—induced to by Dr. Miller's plan. I shall increase to 15 or 20 next year.

J. B. ENOS.

Connellsville, Pa.

Yes, it is possible to winter queens in 3-frame nuclei, providing that the same is packed in chaff hive, between two division-boards, or providing they are to be put into a good dry cellar; but it is usually better to have a stronger colony—one that will cover 6 frames will usually winter very successfully. We have wintered a great many 3-frame nuclei in chaff on their summer stands, but we prefer stronger colonies.

SERIOUS STINGING IN THE THROAT, BUT NOT FATAL.

A neighbor of mine who keeps a lot of bees in box hives wished me to take some honey out of the top they had made there. I smoked them and took a long knife and cut out the combs, which contained honey and some brood. When I had finished he gave me some of the honey to take home, and that honey came very near being the death of my wife. She put a piece of the comb in her mouth; and as it so happened one of the cells contained a bee, which stung her on the tongue, which swelled so large, and her throat also, that she came very near dying from suffocation. She could hardly speak so as to

be understood. You can just think how much I thought of bees about that time. But the good Lord spared her life. I wish you would print this in GLEANINGS, as a warning to others to look out.

Durham, Ct., July 10, 1889.

C. L. ROSE.

BEES IN A HOLLOW ROCK.

I have a rancho in Texas, on which there is a cañon about 100 feet deep, and about half way up in one of the solid walls there is a hole in which I have seen the bees coming and going in a stream about as big around as a barrel. It has never been robbed, as no one can get to it without infinite trouble. I have written you for a smoker. I have one hive here in the city, and four in the country. I think I shall get more. The hive here is doing famously. I see the bees rushing in, loaded down with honey. They beat any thing I ever saw for hard and hurried work.

A. L. REDDEN.

New Orleans, La., June 29, 1889.

There are several places in California such as the one you mention; and one place was pointed out to me where a man lost his life in attempting to take out the honey. The bees went at him in such numbers, and stung him so fiercely, he lost his hold and fell upon the rocks. Where you speak of a stream of bees as big as a barrel, I suppose you mean that a space equal to the size of a barrel is pretty well filled with bees on the wing, going to and fro.

J. D. FOOSHE EXPLAINS.

I shall be glad if you will say that I have never seen Mr. Doolittle's book. I read last year in GLEANINGS, I think, where he gave his plan in detail as to how he reared his queens by nature's plan. At that time I think he said that he saved all the old cell-cups, and transferred eggs or larvæ; and this year, in the *Queen-Breeder's Journal*, I read another article giving the same plan, with perhaps his plan, of using the manufactured queen-cell cups, in which he said he transferred larvæ and had cells built out in upper stories, with queen present. I tried transferring eggs, or larvæ, to old cell-cups, and made such a poor success that I thought of the plan of letting bees start cells and transfer them to upper stories. I gave friend Doolittle credit for my plan for it was suggested to me by him. Friend D. has a masterly article in the April number of the *Queen-Breeder's Journal*, upsetting the Dzierzon theory. I can't help but believe he is right, so far as my experience goes.

Coronaca, S. C., July 8, 1889.

J. D. FOOSHE.

NATURAL HONEY-COMB WITH SQUARE CELLS.

I have a piece of new honey-comb made entirely by the bees, the cells of which are square (4-sided), and the bottoms of the cells are quartered instead of being in three parts; there are about 50 contiguous cells like this, and the surrounding comb has regular 6-sided cells. Is this new, or does it often occur?

C. W. COSTELLOW.

Waterboro, Me., July 3, 1889.

In the experiments made with plates for foundation, some years ago, considerable foundation was made with the cells square; and reports were made through the journals that the bees used it just as well as six-sided foundation. As, however, nothing was gained, but something lost, the idea was dropped.

A NOVEL BEE-CATCHER.

Herewith I send you a sample of my bee-catcher. Well, who has got it patented? If by any possibility nobody has, then, if you wish to, you are at liberty to make and supply all demands.

ANDRUS' BEE-CATCHER.

It is convenient for picking bees off the windows and turning them outdoors, or, better, putting them in a box like the one in which this is packed, and then step to the door and let them out. Take the ends *only* off the box, and pull out the catcher.

Almont, Mich., May 19, 1889. J. H. ANDRUS.

The bee-catcher sent by friend A. is a very ingenious and pretty little machine; but I think very likely they will prove to be more convenient for the women folks than for a genuine bee-keeper himself. They might serve very usefully, not only in getting bees off the windows, but for picking up and removing any bug, worm, or spider that might invade the home.

HONEY FROM TOBACCO.

In GLEANINGS for July 1st are some comments upon bitter honey. I wonder if you ever stumbled upon honey gathered from a tobacco-patch, when other sources were lacking—perfectly clear, decidedly bitter, genuine to a T. This may have been the cause of much of the bitterness alluded to in your journal. I notice the bees prefer to gather water from the outlet of a certain tile, although there are many other outlets *never* visited. I wonder if they distinguish any chemical properties from this percolating through certain strata.

Assumption, Ill., July 12, 1889. W. N. ROOT.

OLD COMBS IN SECTIONS.

As you ask for testimony from experience, I will say I have used sections filled with comb, for the past 8 years, and I can not get enough of them. I always get the highest price paid in market for my honey, and we use a large amount at home; and while we object to foundation honey, we see no fault with old comb. If I use foundation at all it is only as starters. I usually raise my starters in the bee-hive, according to G. M. Doolittle's plan. Old comb should be entirely clean from old honey.

Grattan, Mich., July 8, 1889. A. P. COWAN.

THE T SUPER.

As I use a lot of T supers I will give my plan how to keep the sections down to their place, and at the same time protect them from propolis. I put T tins down from the top between the section rows; this is not new, but you know some of the sections will spring up—that is, they are not square. To keep the T tins down I lay $\frac{1}{4}$ -inch tacks, one on each end of the T tins, with the points toward the sides of super. With one-hand I press the T's down, and with an iron or an eight-inch file I press the tacks in the wood, which keeps the T tins down.

La Paz, Ind. C. A. BUNCH.

The same idea has been suggested before.

REPORTS ENCOURAGING.

PROSPECTS GOOD.

THE prospect for a crop of honey during the next three months is very good. I have 170 hives, about one-half one story, and weak at that, as the bees do not gather honey much in June, and about June 1st they kill their drones, and the queen sometimes stops laying. This year they gave us a few eggs all the time, but did not lay more than half their usual amount. I have just finished extracting 170 gallons of choice honey, and the prospect is good for 15 tons extracted and 2 tons comb honey this year.

G. W. CAMP.

Armona, Cal., July 10, 1889.

I took from two colonies last summer nearly 300 pounds of honey. Around here, if they get 10 pounds they think they are doing well.

Marshalls Creek, Pa.

J. GILBERT.

BOOMING.

Bees are just booming at this date. I wintered 14 colonies in your one-story chaff hives. They began swarming May 5th, and increased to 31 by June 28th. Bees in this section have had a great swarming mania this season.

F. W. LAMM.

Somerville, O., July 15, 1889.

"HONEY UP TO OUR CHINS."

The wax-extractor is just rolling out the yellow stuff. The strainer is "boss," and our "other half" says, "Bless Mr. Root;" and whoever saw a better smoker? We are in honey up to our chins. I will ship you some beeswax soon.

D. H. TWEEDY.

Smithfield, Ohio, July 13, 1889.

HONEY FLOWS LIKE WATER.

I am rushed to death. Honey flows like water. I have taken off 2000 lbs. of white-clover honey. I have 75 swarms now. I had 15 swarms to-day. If I did not understand some of the habits of bees I should get clogged up; but so far every thing is lovely, and every bee doing his level best. Basswood is not yet open. When it opens I shall have eave-troughs on.

E. A. MORGAN.

Chippewa Falls, Wis., July 3, 1889.

A BIG YIELD; 200 LBS. PER DAY FROM 25 COLONIES.

I suppose you begin to think my orders are coming thick and fast. If you were in my place you would not wonder at it. My bees are gathering in something like 200 lbs. of honey per day, and part of them are out of storage room, and building comb on the outside of their hives. I never saw such a honey season. I started in with 25 good colonies and 3 very poor ones; I had 58 supers filled with sections and starters, and have 62 very strong colonies now. We had some heavy rains, which insures a good fall crop of honey.

J. A. MAXFIELD.

Saxon, Ills., July 15, 1889.

REPORTS DISCOURAGING.

LITTLE SWARMING OR SURPLUS.

I had 31 colonies, spring count; very little swarming; and as to honey—well, I have not enough to supply my table. Except one hive there is not 10 pounds of surplus on hives; i. e., on all, old and new.

G. F. AYRES.

Atherton, Ind., July 5, 1889.

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 137.—*a. Do you practice clipping queens' wings? b. If so, do you do it because it saves trouble in hiving the swarms, or because it prevents absconding, or both?*

No. H. R. BOARDMAN.

a. I do not. RAMBLER.

a. Yes; b. Both. GEO. GRIMM.

a. Yes; b. Both. A. E. MANUM.

a. Yes; b. Both. A. J. COOK.

a. Yes; b. Both. S. I. FREEBORN.

a. Yes; b. To prevent absconding. P. H. ELWOOD.

a. Yes, invariably. b. For both reasons. P. L. VIALLO.

I practice nothing of that sort, and am not troubled much with swarming. C. F. MUTH.

No; we never clip wings. We tried it, and got disgusted after two seasons. DADANT & SON.

a. Yes. b. To prevent absconding. I very rarely hive a swarm, as, three days out of four, no one is present in the apiary. C. C. MILLER.

a. No. b. I found more trouble in taking care of my swarms when the queens' wings were clipped than when they are not. It might be different, however, in less favored localities for hiving swarms. JAMES HEDDON.

a. Yes. b. For both these reasons; but they are only secondary ones with me, as I have too little natural swarming to require any special attention to that subject. By clipping her wing we keep track of the queen, which allows us to practice certain methods of management on a certainty, instead of by guesswork. O. O. POPPLETON.

a. Yes, and it pays well. b. It does both if properly done. Four years ago my best colony swarmed, and left without clustering. One of the queen's wings was clipped, but not short enough to prevent flying slowly; but they went over a piece of woods filled with undergrowth, so we could not follow them, and I lost them. A. B. MASON.

Principally because it saves trouble in hiving swarms. I do not know that I ever had a swarm abscond, even when my queens' wings were not clipped, and I never knew more than one to make any great effort to do so. Several important advantages are gained by clipping queens' wings, in comparison with which I think the disadvantages hardly worth mentioning. J. A. GREEN.

a. We clip all our queens' wings. b. We do it to make sure that no swarms go off in our absence. We have no one to look after the swarms or care for the bees in any way when we are not there. Our visits to each yard, during the swarming and extracting season, are from a week to ten days apart. Very seldom do swarms come out while we are away. We make all our increase by division of the old colonies. E. FRANCE.

a. Yes. b. Both, and more especially because the queen is so much more easily found, if she has the larger part of all of her wings off, as I always cut them. In strengthening weak colonies, and in many other operations in the apiary, it is often necessary to find the queen; and any thing which facilitates our finding her, helps just so much in our work. G. M. DOOLITTLE.

a. I have, the past two years. b. I seldom if ever have absconding bees here, perhaps mainly because there is no cave or trees to enter, and I sometimes wonder if they are not somehow held back by the great throng of bees at home. I clip wings to help control swarming. I am not positive yet that I shall always keep it up for that purpose, and to enable me to know my old from my young queens when I wish to displace old ones. R. WILKIN.

I do not. I have never been troubled by bees absconding, or "going to the woods." My experience, extending through many years and many hundreds of swarms, leads me to believe that first, or prime swarms, invariably cluster, after leaving the hive, and that in cases reported of prime swarms leaving without clustering, they had been out before on some previous day, or even the same day, clustered, and, being unobserved, returned to the hive on a second swarming. Such swarms will frequently leave without clustering. MRS. L. HARRISON.

I am an anti-clipper, largely because I greatly dislike to have swarms enter other colonies, as they will do when compelled to come back by the absence of their queen. Clipping has no effect upon that abnormal disposition to swarm known as swarm-fever, unless it be to make it worse; and the great host of second swarms, and thirds and fourths, of course have virgin queens that must not be clipped. In apiaries, where swarming is usually moderate, clipping is a practical method, no doubt. E. E. HASTY.

Most of the respondents practice clipping queens' wings, both because it saves trouble in hiving swarms, and because it prevents absconding. James Heddon, Dadant & Son, H. R. Boardman, Rambler, Mrs. L. Harrison, and E. Hasty, are anti-clippers, in the words of friend Hasty. For those who produce extracted honey, and, as a matter of course, keep strong colonies, clipping queens' wings is not so necessary, as very few swarms, comparatively, will issue. But E. France does so because it makes a sure thing of the swarm. With the Dove-tailed hive, we have lately been putting an ordinary queen-excluding honey-board between the bottom-board and the brood-chamber. Unlike the ordinary drone-excluders or queen-traps attached to the entrance itself, it causes no obstruction to the bees passing in and out. While it prevents the bees from absconding with the queen, it also keeps the queen in the hive, with no danger of her being lost. Of course, if the bees should make two or three attempts to swarm in the absence of the apiarist, and fail, they might kill the queen; but this they would not do with a clipped queen, even without the perforated zinc. Those who have a bottom-board with a bee-space formed by a rim around the outside edges, except at the entrance, can use their queen-excluding honey-boards in the way describ-

ed. Perforated metal in front of the entrance will answer the purpose of clipping; but on account of the drones, and the general hindrance of a limited number of holes for the bees to pass, it makes considerable obstruction at the entrance. A perforated honey-board placed directly under the brood-frames is about as perfect as any thing we have ever tried, and it does the business too. In the basswood orchard we have restrained a number of queens in that way.

QUESTION 138.—*a. If you practice clipping, are you not sometimes troubled by queens getting lost in the grass? b. Do you estimate that such loss is counterbalanced by an occasional absconding swarm with an unclipped queen?*

a. No. GEO. GRIMM.

a. Yes; b. Yes, and more. S. I. FREEBORN.

I do not practice clipping. MRS. L. HARRISON.

a. Yes. b. Yes, many times over C. C. MILLER.

I have never had any experience in clipping queens. H. R. BOARDMAN.

I should prefer to lose a swarm occasionally to clipping the wings of queens. C. F. MUTH.

Having clipped but very few queens, I do not remember to have ever lost one in that way.

E. E. HASTY.

a. Yes. b. We have so few swarms abscond that it is hardly worth considering as a factor against us. JAMES HEDDON.

a. No; b. I have practiced this clipping for 20 years, and there has been no loss to counterbalance. A. J. COOK.

a. Seldom. b. Losses from both of these causes have been too small with me to need taking into account. O. O. POPPLETON.

a. Yes, occasionally, when too careless. b. Yes, especially now that queens can be bought so cheap all over the country. PAUL L. VIALON.

a. Yes, especially when we get behind in our work. b. We lose very few, and the loss is not to be compared to loss of swarms. P. H. ELWOOD.

a. There is no grass in my apiary for queens to get lost in. I should not anticipate much trouble if there were. d. Yes. J. A. GREEN.

a. I suppose I do not lose one queen in thirty at swarming; but I reckon myself as more skilled in finding queens than in any other part of my business. R. WILKIN.

a. No. What on earth do you suppose I want grass around for—that is, tall enough for that purpose? One of friend Root's 12-inch \$4.30 lawn-mowers does away with that nuisance, and makes "fings look beautiful" in the apiary. A. B. MASON.

a. No, not when the attendant attends to business. b. Yes, as the loss of a queen at swarming time is of but little value, compared with a swarm of bees, as queens and queen-cells are plentiful at this season, or ought to be, in every well-managed apiary. A. E. MANUM.

I formerly clipped all queens' wings; but in swarming, unless the apiarist was looking at the yard all the time, queens were liable to get lost. If an apiary is run in a common-sense manner, there

is no swarming to contend with, and no loss of queens. The Rambler has had but one swarm in the past three years, and that swarm came from somewhere else. RAMBLER.

a. No, I have lost but one queen in this way in an experience covering a period of 19 years. If you do not allow the grass to get tall, and no apiarist should so allow, there should be no trouble in finding queens. b. I have lost only the one queen as spoken of above, and not a single swarm by absconding, so I shall keep up the practice of clipping the wings of my queen, as I believe it is very profitable for me to do so. G. M. DOOLITTLE.

We do sometimes lose a queen when swarms come out in our absence; but we lose but very few in that way. I would rather lose 20 queens than one swarm during our swarming season. The loss of a swarm is the loss of the honey that they would have gathered, but the loss of a queen at that time is no loss at all, as the eggs laid now would not be hatched in time to gather any of our surplus honey. Our surplus-honey season closes with the basswood. If a queen is lost during our honey harvest, the bees have plenty of time to raise another. We want our workers all hatched before the middle of June. From the middle of June to July 15 I would rather not have any brood to feed, and we often cage queens to prevent raising brood at this time, as our honey harvest is short and we want to make the most of it. E. FRANCE.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

HOW TO BURN SULPHUR.

The best way to burn sulphur is to melt it over a fire and dip strips of muslin in it. The muslin will burn like a tallow candle, and burn all the sulphur it will take up. Make a trial and satisfy yourself.

Souderton, Pa., June 18, 1889. M. B. BERGEY.

THE BEST LOCALITY FOR HONEY.

What portion of the United States do you consider best for the abode of a bee-keeper, every thing considered? A. M. DOTY.

Kansas City, Mo., July 12, 1889.

[Southern California and Southwestern Wisconsin are as good as any. All the Northern are good honey States. As to your own State, you *might* not better yourself if you moved.]

HOW TO SILENCE THE BOGUS-HONEY STORIES.

I see a great deal in GLEANINGS about adulterated honey. Now, there are some right here who believe that honey and comb can be manufactured. I argue by the hour some days, and tell them you will give them enough to get married if they can prove it. J. G. EARL.

Arden, N. Y., July 8, 1889.

THE QUEEN-EXCLUDING HONEY-BOARDS DO THE BUSINESS.

The No. 1 honey-boards, 15 x 17½, are the finest thing for raising extracted honey I have ever seen. I used the fifty I had of you in May, and used full frames of comb in upper hive, and not any brood above in one of them. J. H. HAIGHT.

Brothertown, Wis., July 8, 1889.

ANOTHER ONE GONE.

Our good friend and bee-keeping brother J. Vandervort, of Laceyville, Pa., has lost his beloved wife after years of suffering. She died of consumption on the 12th inst. The blow is none the less because our friend was long prepared for it. Our hearty sympathy is extended to him in this sore affliction.

C. P. DADANT.

Hamilton, Ill., July 19, 1889.

SULPHUR FOR FUMIGATING.

Take a common iron pan; to every teacupful of sulphur put a tablespoonful of alcohol in the center. The sulphur must be thoroughly dry. It can not be too dry to burn up clean. Damp sulphur will not burn well, and will run. It is not necessary to have a great draft. It will burn with a little draft.

M. H. MENDLESON.

Ventura, Cal., July 3, 1889.

STINGLESS BEES.

Have you ever seen any stingless bees? Gov. B. F. Flanders, while in Mexico, saw several hundred hives (the hives being merely hollow logs piled one on the other, pyramid shape), and the bees were stingless.

A. L. REDDEN.

New Orleans, La., June 29, 1889.

[We have never seen any stingless bees, friend R.; but our correspondents have before mentioned the fact that they were pretty common in Mexico. They are of little practical value, however. The amount of honey they gather is insignificant. Like some human beings in a warm climate they live only from hand to mouth. A Mr. Grouen, writing from Brazil to one of the German bee-journals, speaks of 18 kinds of bees, the greater part of which are stingless.]

SWARMING OUT AND TAKING THE HONEY WITH THEM.

We had a swarm of bees that came out the 26th of June. We hived them, and they went right to work carrying honey from the hive they came from into their own, and kept it up two or three days. Now they are all right.

W. BURGESS.

Kansasville, Wis.

[What you mention, friend B., is very singular, although I believe that such things have been recorded once or twice before—a new swarm going back to the parent hive and carrying off its supplies. It has happened, I believe, however, only when there was a dearth of honey after the swarm goes out. If that state of affairs should continue, of course the parent hive would be likely to starve. When the honey-flow commences again, this borrowing from the old folks ceases.]

SPIDER PLANT, ETC.

Do you still find spider plant as productive as indicated in the A B C of Bee Culture? The cut illustrating the surprise of Novice, eld Sol, and the bees, presents an amusing tableau. What plants are best adapted to rather light sandy loam soil? What of the Simpson honey-plant? J. H. HOAG.

Waterford Works, N. J., July 2, 1889.

[We still find the spider plant as productive as mentioned in the A B C, providing it is on very rich ground, and has good cultivation. Such ground, however, if put into strawberries, would give a yield of 100 bushels or more per acre; and so far the 100 bushels of strawberries has proven to be much more profitable than the honey from the spider plant. With the latter, however, the bees gather the crop without expense. With the strawberries you have to have a swarm of boys and girls.]

MINERAL WAX.

I was very much surprised to see your inquiry about mineral wax in GLEANINGS. Near Boryslaw, Galicia, 50,000 hundredweight of ceresin is dug out every year. It is called, when raw, ozokerit; after

being refined, crosin, ozo-cerotin, or ceresin. Wax is taken from *Myrica cerifera* and *Myrica Carolinensis*, etc. There are about six different kinds of vegetable wax. It would make a long and interesting article for GLEANINGS.

PAUL PEINE.

Martinsburgh, W. Va., July 22, 1889.

ANSWERS TO QUESTIONS

FROM OUR A B C CLASS.

This department is designed primarily to cover questions either not already answered in the A B C of Bee Culture, or, if incorporated in this work, are here dwelt upon more in detail on account of the importance of the question. While these answers are of vital interest to the A B C scholars, they will doubtless be found, in many instances, to be of considerable value to the more advanced student. For lack of space, the question itself, instead of being directly stated, is omitted, the same being implied in the answer. It is hoped that the class will first consult their text-book before sending in their questions.

G. C., Connecticut.—If your bees are lying out, smoke them in and give them a little more room, adding a super, if they have not one already. Sometimes it may be advisable to lift the cover up a little temporarily, to give the bees a little more ventilation.

TO GET RID OF ANTS AMONG THE HIVES.

J. K., Missouri.—To keep black ants out of the hive, get rid of the ant-hills in the immediate vicinity by pouring on them coal oil. Mr. A. E. Manum recommends putting pieces of tarred paper on top of the brood-frames.

TO MAKE SWARMS STAY AT HOME.

R. A. T., N. Y.—We can not discover anywhere in your letter that you have taken the precaution to put in a frame of unsealed brood into the hive where you put your new swarm. If you are troubled by the swarm leaving, try the unsealed brood, and you will be surprised to see what an effect it has in holding them. It is not infallible, but it exercises quite a stay-at-home effect on the bees.

J. W. M., Pennsylvania.—We have seen chilled brood that looked in every way like foul brood, with the exception of the dark-brown color and the ropiness. We should rather incline to the opinion that your bees are affected with chilled brood were it not for the fact that you say it is spreading. Taking it all in all, we should say it is foul brood. To further assist you, please read the article, "Foul Brood," in the A B C book which we send you.

A. Y. B., Illinois.—The latest edition of our A B C of Bee Culture gives very full directions how to get bees into the sections. A recent article from G. M. Doolittle recommends placing a small piece of drone brood in the surplus apartment. Bees will not enter the sections unless honey is coming in at a pretty good rate. The colony should be strong. When we say "strong" we mean 6 or 8 pounds of bees. There should be so many they can hardly be accommodated in a single story.

A SPECIMEN OF FOUL BROOD.

J. W. M., Pennsylvania.—Your sample of brood came to hand. After carefully examining it we can not be sure even now that you have real foul brood. The odor from it is more distinct and penetrating than that from the disease which we have had. It can scarcely be called ropy, yet it has somewhat of this characteristic. As you say it is spread-

ing, it is quite likely you have foul brood. We should be glad to have you keep us posted in regard to it. If there is some disease which is very similar, or akin to the disease which we have had, we should like to know it.

DRONE CELLS FROM WORKER FOUNDATION.

A. W. G., Wisconsin.—Bees will seldom work worker foundation out into drone comb. Sometimes, when the foundation is not wired, it sags, and the cells elongate, and the result is drone-cells, or at least the same are sometimes filled with drone brood. If the foundation is wired, and there is a young queen in the hive, you will not get a single cell of drone brood; in fact, you will rarely get drone comb out of worker foundation under any circumstances.

SWARMING AS A RESULT OF A SURPLUS OF CELLS.

C. F. S., Massachusetts.—The reason your bees swarmed is because you allowed them to build queen-cells. Immediately after the issue of the first swarm you should have examined the parent colony, and pulled out all the queen-cells but one. As long as there is a surplus of young queens or cells, so long, probably, will you have swarming. If they still continue to swarm, give them a young laying queen, and they will be likely to settle down to business. The latest edition of our A B C book will give you further hints on this point. Please read "Swarming and its Prevention."

CAN THE PURITY OF AN ITALIAN QUEEN BE DETERMINED BY HER LOOKS?

C. M. H., Wisconsin.—The queen and your letter came to hand. Allow us to correct the wrong impression that you have. Pure Italian queens vary in color, all the way from black to a bright golden yellow. In fact, the Italian queens are the most variable in color, stripes or no stripes, of any race of queens. It is utterly impossible to say from looks of a queen whether she is Italian, hybrid, or black. Her purity must be judged entirely by her progeny—the number of their yellow bands, their disposition, etc. The other colony which you speak of, which were first Italian, and then turned out to be blacks, probably lost its Italian queen, and the hybrid was reared in its stead.

J. L. U., Mississippi.—The Golden bee-hive is a swindle, and the vendors of the same are rascals. The less you or anybody else has to do with them, the better. You can make any hive you please, and they have no right to interfere. If they threaten you with suit, tell them to come on. They will do nothing but talk. Their hive is virtually the Langstroth hive, as Prof. Cook says, and this hive is the property of the world. The Golden bee-hive people may possibly have a patent on some insignificant feature of the hive, but that need not trouble you. If they are going to enter suit so fast, tell them to sue A. I. Root. He is one of the biggest infringers on their alleged patent, and we do not care if you show them this letter. We have published the Golden bee-hive as a swindle for years. They work only in localities where the people are ignorant of modern apiculture.

HOW TO ITALIANIZE ECONOMICALLY.

O. B., Kentucky.—The best way to Italianize is to purchase three or four untested queens of some reliable breeder, if you want to do it with as little money as possible. After these have produced a

lot of Italians, are populous and strong, give to each of the queens a frame of drone brood; cause as much Italian drone brood to be raised as possible. In the meantime, keep all black-drone brood shaved down. If you have any black drones flying in the air, trap them with perforated zinc. After you have raised a lot of Italian drones, start raising young queens from your tested Italians. These will probably be fertilized by the Italian drones. If your neighbors have black bees in box hives, put perforated zinc successively in front of each hive until you have trapped out all the flying drones. Your neighbors will not object if you tell them what you wish to do. We can not very well send you drones by the pound; but you can rear them in the way stated above—enough so to make quite a decided showing of pure Italian queens from those you raise.

FOUNDATION IN HIVES SET UP; GLASS IN THE SIDE OR ENDS OF HIVES.

L., Pennsylvania.—We do not furnish foundation for the brood-nest of our regular hives set up, unless it is specially ordered. Foundation is a great convenience, and prevents the comb from being built irregularly; but as it is not absolutely necessary, we do not send it out. In regard to the arrangement of your hives, we would not advise you to put them upon benches. Put them on a nice clean place directly on the ground. Very few good bee-keepers recommend having the bees raised up from the ground. To put glass on the sides of all the hives so that you can see what the bees are doing would make a big bill of expense. The glass would break in shipping, and we can not see that it would be of any particular advantage. If you get more good colonies, we think you will agree with us that we don't want any glass at the sides or ends of a hive. The best way to examine a hive is to open it and pull out the combs. To watch the bees to the best advantage, get an observatory hive.

HOW TO MAKE A COLD-BLAST SMOKER CONQUER.

J. E., New York.—We do not make any smoker hot blast. If you will use excelsior and sawdust mixed, or even planer shavings mixed with a little sawdust, pack them solid in the fire-box, make a little ventilating hole with a lead-pencil or other instrument through to the grate, ignite with a match, and get well a going, you will have a volume of smoke that is equal to any hot-blast smoker. When we have filled the smoker in this way we have sometimes wished, on account of the abundance of smoke, that there was no such thing as a smoker around the bees. Yes, we have even had to drop the smoker and step a little distance away and get a chance to breathe. The great secret of making shavings and pine sawdust burn is so make a draft-hole right through its center, after packing it solid. As it burns, this hole continually enlarges. Another point: Suppose you have a hybrid colony to handle. They are very cross, and you want an extra amount of smoke. Fill the smoker as before directed; place your thumb over the end of the smoker, closing the nozzle. Work the bellows until the fuel of the fire-box is ablaze, and the flame shoots out at the rear end of the smoker. Now then: Turn on your hybrids; and if you can not conquer them, smoke will not do it. You may think you would burn yourself to close the orifice to the smoker with your thumb, but you will not.

TOBACCO COLUMN.

CONDITIONS UNDER WHICH WE GIVE SMOKERS TO PERSONS WHO
STOP USING TOBACCO.

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to GLEANINGS. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco-using, providing he give us his pledge that, if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to GLEANINGS, though we greatly prefer that he be one, because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

THE UNION IN TOBACCO.

Come, one and all, and hear me tell
How those who smoke can ne'er do well;
They smoke that they may taste and smell,
And for tobacco they will sell
Their rights to social union,
Their rights to social union.

They clean their pipestems with a wire,
Then fill the bowl and stick in fire,
And smoke till it doth quite expire;
Nor do they ever seem to tire
Of this tobacco union,
Of this tobacco union.

Sometimes from two to ten you see
Collected in one company,
And all agreeing in high glee,
To have a jolly smoking-speech,
A jolly smoking union,
A jolly smoking union.

And as they smoke the fumes arise
Like morning mists beneath the skies;
Then woe to him who bath weak eyes,
Unless he gets him up and hies
Away from such a union,
Away from such a union.

Some folks there are who smoke and chew,
Tho' oftentimes it makes them spew,
Makes them drunk as a tippler too,
And still the habit they pursue,
And boast of social union,
And boast of social union.

Sometimes about their neighbor's door
They cast their quids—two, three, or four,
And spit upon the hearth or floor,
Perhaps a pint, or less or more,
And talk of social union,
And talk of social union.

Sometimes within the church you view,
Some persons there will sit and chew,
And spit upon the floor or pew,
Until it spreads a foot or two,
And sing of heavenly union,
And sing of heavenly union.

The quids are oft so large within,
The juice runs out and stains the chin;
And then I always have to grin,
And think there is no little sin
In this tobacco union,
In this tobacco union.

Willow Springs, Mo.

J. S. H. BLACK.

Please send a smoker to my friend M. E. Dickson, of Days, Desoto Co., Miss., who has resolved to quit the use of tobacco. If he commences again I will send you the price of the smoker.

Horn Lake, Miss.

JAMES R. ELMORE.

Please send a smoker to Mrs. S. A. Eley, for she has taken the pledge to quit the use of tobacco; and if she uses the weed again I will see that you get your money.

J. W. TAYLOR.

Hickory Creek, Ark.

I have a young friend who is slightly interested in bees. I have been loaning him GLEANINGS to read. We have lots of talk. I induced him to quit the use of tobacco. He has seen your offer as a pledge, and has requested me to write for it. If he ever breaks his pledge I will send you \$1.00 for the smoker. His address is Jno. T. Dedmon, Navasota, Tex.

W. W. SOMERFORD.

In the May issue of GLEANINGS I notice in your Tobacco Column you offer a smoker to any one who stops using the weed. In case this entitles me to your offer I stand ready to contract with you under the conditions in GLEANINGS. As I have a few colonies of bees I hope to profit by them through your liberal offer of the smoker, and through your journal; and lastly, but not least, quit smoking.

Maple Creek, Neb.

J. H. KLINE.

In your Tobacco Column you state the conditions under which you give away smokers. I read in GLEANINGS how that cancers and other diseases are caused by the use of tobacco. New Year's day, 1888, I thought I would stop the use of the cursed plant. I have abstained from the use of it ever since; and feeling no desire to return to its use, I feel confident that I shall not have to pay for the smoker in the future. You may take my name and use it to the best advantage, as it may be instrumental in inducing others to quit.

Burlington, N. J.

SHERMAN BORDEN.

How thankful I am that there are so many dropping off the filthy habit of using tobacco! and I am glad in my heart that I belong to that little band, after using tobacco ever since I was 13 or 14 years of age (I am now 42). I have read GLEANINGS for some time, and have been a subscriber since January last. I read many good pieces before I came to the conclusion that it was a filthy habit; and seeing that some had used the weed longer than myself, and had given it up, I said to myself, "Why can't I?" So I thought to myself, "I will try, but not in my own strength alone, but ask the good Lord to help me, and take away the appetite;" and I feel to thank him for what he has done for me in this one thing alone, with all the other blessings that come from his bountiful hand. I feel that I owe some of it to you and GLEANINGS. So let others take warning, and don't say, "I can't quit," for that is a mistake; for I have said the same. Undertake it, and ask the good Lord to help and strengthen you, and give you grace to overcome the evil, if it is one, and I believe it is. Now, friend Root, if I am worthy of a smoker, send me one, as I quit tobacco in all forms seven weeks ago; and if I ever take to it again I will pay you for the smoker. I don't want to be hired, or any thing of the kind; but it is to keep me in mind of my pledge. But I have no desire for the weed now, and am determined not to touch it again.

N. J. MCADAMS,

Western, Neb.

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

THE HOPATCONG; A NEW HAT FOR THE APIARY.

A MONTH or so ago, one of our engravers (who by the way is interested in bees), seeing a peculiar kind of hat in one of the shop windows in Cleveland, sent a rough pen-drawing of the same, with a note, asking if such a hat would not be very cool and desirable for a bee-keeper. Upon receipt of this I wrote him, asking him to have one sent, that we might try it. After testing it a couple of weeks in the apiary, during some of our hottest weather, I requested him to make an engraving of it, showing it in different views. This he has done, and I append the result below.

A NOVEL BEE-HAT, ALIAS THE HOPAT-
CONG.

The engraving is so complete as to make a detailed explanation almost unnecessary. You will observe that the hat is supported by a light rim, an inch or so above the crown of the head. Its special feature is the perfect access of light breezes to all parts of the head. An ordinary hat, it should be observed, incloses the top of the head in a tight box, as it were, leaving very little opportunity for the escape of the heat formed by the rays of the sun on the top of the hat, and heat formed by radiation from the crown of the head. The result is that most hats in the hot sun, while they ward off the direct rays of the sun, do not leave sufficient ventilation around the crown of the head. This Hopatcong is very airy; and in practice, I can confidently say, is about as cool a sun-shade as I ever wore. I liked the light cloth hat we advertised, but it was hardly sufficient protection from the sun, although it allowed the breeze to circulate through the light fabric of the crown. I have exchanged hats with different persons, and the verdict is always that the Hopatcong is the coolest hat they ever wore. It is the same sort of hat that we see represented in pictures of scenes in China and In-

dia. Although not a very handsome head protection, it is extremely comfortable; and if the natives of India and China use this hat to any great extent, they have more respect for comfort than some of their more civilized neighbors.

There are two objections to the Hopatcong. While it projects far enough forward and back to properly shade the face and neck, it is hardly wide enough to give sufficient protection to the sides of the neck, as the diagram at the upper left-hand corner will show. Again, it is rather too expensive to be adopted very generally. The one that I wore cost \$2.00 at retail, and I have not yet learned where they can be obtained for less money. I understand that they are being used to some extent in the Southern States, and that they are retailed at a dollar apiece. They can certainly be made for less money; and as soon as the people who are necessarily obliged to work in the hot sun know of their comfort, they will be adopted more generally, in spite of their oddity, I think. Now, please do not send in orders to us for these hats—at least for the present. I am quite sure that you can get them in most cities, and your local retail dealer in hats and caps ought to be able to procure you one if you wish.

A VERY GOOD SUBSTITUTE FOR THE HOPATCONG.

Just after I had gotten the Hopatcong, our Mr. Spafford, who is in the apiary constantly, struck upon an idea which I think is certainly worthy of being given to beekeepers at large. It is this: He purchased an ordinary palm-leaf hat, but one or two sizes too large for him. He then wet the hat so as to make it assume a conical shape, the same as shown on page 249, 1887, where Dr. Miller is seen emptying a T super of sections. He then took two corks, about $\frac{3}{4}$ of an inch in diameter. These he cut into halves longitudinally. These four halves were then sewn on the inside of the crown of the hat, equally distant from each other. When the hat is adjusted to the head it is supported from the head by means of these four corks. In other words, the hat itself—at least that part which would ordinarily come in contact with the head—is kept $\frac{3}{4}$ of an inch away. This leaves quite a good opportunity for the circulation of air around the head. Mr. Spafford and I often traded hats, and I have been surprised to note that his hat was nearly as cool as the Hopatcong, and his did not cost more than about an eighth as much as mine. It had this additional advantage, that the drooping rim thoroughly shaded the head and neck on each side as well as before and back. While all the breeze would not circulate over the crown quite so freely as in the Hopatcong, yet it was decidedly cooler than the ordinary straw hat, where the rim fits closely around the head. On some accounts I should prefer it to the Hopatcong. Now, may I suggest that Dr. Miller take his bee-keeping hat, or, rather, get one a size larger than he ordinarily wears, if he can, and adjust the little pieces of cork in such a way as to keep the hat away from the sweaty head? If he does not think it is a great im-

provement over his old hat, then I will send him my Hopatcong all the way to Marengo, free of charge.

Oh! by the way, as I was wearing the Hopatcong constantly, I very thoughtlessly, on my way to the basswood orchard, one day went through the streets of our village with this odd-looking head protection. I could not quite imagine why everybody was staring at me; nor could I guess, when I got back further into Hoosierdom, why the farmers would constantly look at me. Then I reflected that it was my Hopatcong. Well, I consoled myself with the feeling that I was not considering looks but comfort. I mention this incident to show you that it is an odd-looking hat, and if you wear one you must not be surprised if you are stared at by visitors.

THE CANADIAN HELMET.

While on the subject of hats I may mention the Canadian helmet—such a hat as is worn by bicyclists and others, made on the same principle as the Hopatcong, as above illustrated; and if they only afforded a better shade they would be as cool. I have myself worn one during one season; and my brother-in-law, Mr. Calvert, wears one every day (he is a Canuck, you know). As years go by, I begin to see these hats more frequently on the streets. When I visited D. A. Jones, he insisted that I should wear one of his helmets, which I did under protest; but I very soon learned to like it; and after I came home I seized the first opportunity to get one.

SWARMING AT THE HOME OF THE HONEY-BEES.

Very soon after the last issue was mailed, swarming began to "let up," and we had only about one swarm a day. We now have none at all. I am satisfied now that our excessive swarming was largely if not entirely due to the number of old queens in the apiary, some being three years old. This apiary, on account of foul brood during last year and the year before, has not been used for filling orders, consequently this year almost all the queens are old.

HOW MANY BEES IN A POUND?

A short time ago a prominent pharmaceutical concern in the city of New York gave us an order for 1000 bee-stings. Perhaps I should explain here, that from bee-stings a medicine is prepared called *apis melifica*. This medicine is used only by homeopathic physicians, who give it to patients in cases of swellings, skin ruptures, etc. To return: Stings can not be extracted from the bees in any wholesale way. It must be done one by one, and with suitable tweezers. Our method of procedure was as follows: A frame of bees was put in a comb-holder, just before the window. Our Mr. Spafford took a pair of tweezers and grasped the bee by the thorax. A slight pressure caused the bee to protrude its sting a trifle. Another pair of fine tweezers grasped the sting and pulled it out. A cruel operation, you say. Yes, but the bee was crushed immediately after the removal of the sting, by the tweezers holding the thorax. There was no other

way than to count each individual sting as it was pulled out and dropped into a receptacle to receive it. In the tray, after the whole job was completed, we had 1000 stingless bees. These bees were placed on some very delicate scales, and weighed. As nearly as we could get at it, 1000 bees weighed $2\frac{1}{4}$ ounces, minus their stings; but as the sting itself is such an exceedingly small instrument—much smaller and more delicate than the point of the finest cambric needle, and very much lighter, it would not play any very great part in the weight of the bee. However, it would be fair to suppose that 1000 stings might weigh $\frac{1}{2}$ of an ounce—not more, I think. These bees, at the time of killing, had very little honey in their honey-sacs—about as much as bees usually have when sold by the pound. In round numbers, then, 1000 bees will weigh three ounces. At this rate a pound will contain just exactly 5333. If the bees have very much honey in their sacs, this number would be reduced to something like an even 5000, or perhaps a little less; so it is fair to suppose, under ordinary circumstances, if my estimate was correct, that a pound of bees would contain, on an average, about 5000 bees. For several years back we have said in our price list, "As nearly as we can make out, there are 4000 bees in a pound." In our next edition we will put it 5000, unless somebody makes out that I have made a mistake. I should like to have some one else experiment and see if my figures are correct. There is no practical bearing as to how many bees there are in a pound; but it is interesting to know, when we are talking about the numerical strength of a colony, how many thousand bees there should be in a hive to be able to take advantage of a honey-flow. Some colonies of bees contain 8 pounds, and some even 10; the average working colonies, not much over 5 pounds. The number of bees in a colony might range, then, all the way from 5000 up to 50,000. Now, will not somebody be kind enough to weigh the bee's load, and tell us how many grains or ounces of nectar 1000 bees can carry?

Since writing the foregoing, I discover on page 313 of Dadant's Revised Langstroth that a Frenchman, L'abbe Collin, has found, by careful experiment, that, in a normal condition, it takes about 5100 bees to make a pound. Considering the difference in bees and circumstances these figures are pretty close to mine. He says again, while in a natural swarm supplied with honey it takes less than 4300 bees. Now, on the supposition that the latter figure is correct, how much does one bee-load weigh? Here is a chance for our young bee-keepers to use their arithmetic. Well, I will give my answer. One bee-load weighs in round numbers $\frac{25}{5100}$ of a pound; or, in other words, it takes 25,000 bees to carry a pound of honey. According to this it must take a tremendous big swarm, say 12 lbs. of bees (estimating 4300 to the pound), to carry on the wing with them even 2 lbs. of honey. It seems as though there must be a mistake somewhere, for an average swarm ought to be able to carry with them more than a pound of honey.

NOTES OF TRAVEL.

A. I. Root Among the Bee-Men of Illinois and Wisconsin.

WHAT HE SAW AND WHAT HE LEARNED.

IT is now 15 minutes of train time, on the afternoon of July 11, and myself and Blue Eyes are all ready for a trip. Mrs. Root decided that she could not go this time. My first point is Chicago, and thence to Dr. C. C. Miller's, Marengo, Ill. More anon.

July 11.—At Elyria we found the train two hours late, and so we found our way into a meeting of the Salvation Army. I felt that the spirit of Christ Jesus was there, in spite of their queer methods. The leader was a woman of middle age, evidently a hard-working woman; but the earnestness and zeal with which she prayed was hard to be resisted. The audience was few and scattering, but the melody of their simple hymns still lingers in my ear, and, I trust, in my heart also.

July 12.—This morning we saw the sun rise on the great grain-fields of the West—the wide acres where bread for the world is grown. How beautiful are the harvest-fields with their modern machinery! The village gardens, many of them, look shabby compared with neat, clean, orderly grain-fields.

July 13.—I have been getting an appetite for breakfast by helping friend Miller hoe out one of his little gardens of roses. You see, I am here a week before I expected to come, and so their plans of having the roses (and bees too) all in apple-pie order were rather upset. When I arrived the doctor was at the Wilson apiary; but his good wife sent me over, and I begged to go out among the bees and take them by surprise. The bees were making such a roaring, and the doctor's long hat came down over his face so much, I easily got up right by his side, unperceived. The hat is the one on the table in the picture (see GLEANINGS for 1887, p. 249). I watched him make his examination, but said nothing. Finally he very leisurely straightened himself up, but even then did not see me until he became conscious of a shadow near by; then he gradually tipped back his head until he could look over the apparition that had so noiselessly come close to him. For a brief second he seemed "sort o' dazed," and stared with open mouth in a way that seemed to say, "Well, who are you, and what do you want, and how came you here, any way?" until I really began to fear he wasn't going to be glad to see me; and then what a laugh we *did* have! Miss Emma was but a few feet away; but the roar of the bees, and the fascination of finding T supers with section after section filled and capped over with snowy-white cappings, held her spellbound until I went up and startled her too, by telling her I wanted to see the lady who is not ordinarily very much "stuck up."

Well, Dr. Miller has propolis enough in his apiaries so there is quite a chance to get stuck up, and therefore both of them were

clad accordingly. They didn't expect me for a week, and they were just "going for" the bees, in order to get the work ahead before I came. Some fire had dropped out of one of the cold-blast smokers, and burned a great hole in Emma's dress, and—then we all had another big laugh. She was just under one of her father's own apple-trees, close by her own home; and if she *wasn't* rigged to receive company, it was *my* fault and not hers. Had I knocked at the front door, and then sat in the parlor while she went in the back way and took half an hour to fix up—but I didn't, and I didn't feel bad about it either.

I just got one of the smokers and helped "make honey." I do wish the publishers of the cyclopedias could be with us so as to tell accurately just how honey is made. Dr. Miller controls swarming by caging the queen just before swarming time, and keeping her caged ten days. All queen-cells are carefully destroyed when the queen is caged, and when she is let out the bees are shaken from the combs, and a most *thorough* examination is again made for queen-cells. It is some work, but it does the business. As fast as the sections are capped, or nearly all capped, the T supers are stacked up over one of the hives until we get time to carry them away. As fast as one full T super is removed, an empty one takes its place. I tell you, the honey is coming in lively, and we are having fun for sure.

TAKING HONEY FROM THE HIVES.

Dr. Miller handles T supers only, and no sections are ever pushed out or sorted out in the apiary. When a T super has all the sections nicely capped but one or two, it is removed from the hive. They do not stop, however, to get *all* the bees out, but just drive most of them out with the smoker, and then they are laid up in tall piles over some hive of bees that stands in a convenient place. Here they are left until ready to be loaded up. Then one person stands on a hive or box, so as to hold a smoker easily over the pile, and drives the bees down, while another lifts them off. By this means the young bees left in the supers are all driven down in the hive under the pile, and none are lost. The old ones fly to their own hives if they want to. When all are hauled home, the sections are removed all at once, as we have already described—see page 249, 1887—and the unfinished ones are put in a super, to be put on some hive again.

I have before spoken of the doctor's plan of preventing swarming. Well, there is a sequel to this matter of caging queens for 10 days. When Dr. Miller told me the bees would start queen-cells where a queen is caged and laid between the top-bars, almost as soon as if the queen were removed entirely, I was incredulous. Years ago I found so many times that bees would not rear queen-cells when they had a caged queen in the hive, I had set it down as a settled fact; but right before us were hives by the hundred where the queens had been caged about ten days previously, and I was invited to look them over, and see whether there were queen-cells or not. I had to give up. In thinking the matter over afterward,

I discovered, I think, the reason why my bees built no queen-cells while they had a laying queen in the hive. The doctor commenced caging his queens just when swarming began. His colonies were also crammed with bees and crammed with honey. They were up to swarming pitch, as they have to be to work fairly in boxes. In my experiments, both honey and bees were kept out of the way by extracting and selling bees by the pound.

If no cells are destroyed until 11 days after the queen was caged, most colonies will, during a honey-flow, start a nice lot of cells, and on the 11th day these can be cut out, or, as often happens, you can pick them open and get live virgin queens to introduce to nuclei. We got half a dozen fine queens from one hive where the queen had been caged 11 days before. Dr. Miller keeps some laying queens constantly on hand in nuclei, for emergencies. These nuclei are simple L. hives, with a thin wood division-board in the middle. This division-board is made to stay absolutely tight, by slipping a strip of folded tin on *each end* and the *lower edge*. Now, instead of tacking this tin to the *division board*, it is tacked to the hive, therefore the board can be slid out or put back, and no bee can ever pass under or around the ends. Along the *top edge* of this division-board a quilt, or enamel sheet is *tacked*, so the loose sides will cover the nuclei. The entrances are, as usual, on the portico, only they are as far apart as they can be, while the two nuclei are as close up to the thin division-board as they can be, so as to make them virtually one cluster of bees, so far as saving the animal heat is concerned. I know this is all old, but the doctor uses such nuclei very successfully.

A DAY WITH E. FRANCE.

Friend F. has at present seven apiaries, and has extracted 24,000 lbs. of honey. He is somewhat eccentric, as original geniuses usually are. It is amusing to see how widely the *plans* differ among different bee-keepers. Dr. Miller works for comb honey only, therefore he has every thing adapted to it. When I first saw him work I criticised and found fault with a good many things; but when he gave me his reasons for so doing, and especially after I had worked with him one day, I became gradually quite a convert to his methods. Well, it has been so with friend France. The latter produces only extracted honey, and his out-apiaries and every thing else are specially adapted to it. First, he says he would rather have all black bees than either Italians or hybrids; next, he prefers a frame about 21 inches high by about 12 wide, and this frame stands on end. Lastly, he prefers tenement hives, tall enough to take this tall frame, *two stories high*. These hives are so tall and "tower" like, that his boys have christened them "shot-tower" hives. Each hive contains 72 of these great frames, and the outside is all chaff-packed. He has used them now four years, and says all the hives he makes for the future shall be these. He lets the bees have both upper and lower story for winter. He has, of course, rousing colonies, and has never lost a colony in wintering in them.

When he extracts a "shot-tower" he sometimes gets a *barrel* of honey. The bees (four colonies to each hive) have entrances on each of the four sides. Each colony has an upper and lower entrance. The upper one at the bottom of the upper frames. The bees work about equal at each entrance.

At Dr. Miller's I found they were using the cold-blast smoker. They were not using them because they expected me to come around there, for I came a week before I promised to. I laughed at them some about it, especially as they had before decided in favor of the Bingham smoker. They said, however, that, after trying first the largest Bingham smoker, then the Clark, and changing from one to the other repeatedly, they had at last settled down in favor of the cold-blast smoker. Please, dear friends, do not think that I mention this solely because I want to recommend the Clark smoker. We bee-keepers, the best of us, have not only lots of notions, but we also change about and get into habits. I am not sure but that Dr. Miller and his helper will eventually come back to the largest-sized Bingham again. At one place where I stopped, when I mentioned that the doctor had laid aside the Bingham and was using the cold-blast, they turned on me so vehemently, and abused the cheap Clark smoker so emphatically, that I was almost sorry I had said any thing about it. A higher-priced smoker *ought* to be better; and for very large apiaries, they will doubtless be considered better in the hands of many; but the cold-blast surely does very well for a moderate number of colonies. But some of the friends of the Bingham will hardly admit that Now, then, I am coming to a point. What do you suppose E. France, with his seven large apiaries, uses in the way of a smoker? I do not believe you could guess in a week? Well, it is the old-fashioned mouth-smoker, used by Doolittle, only a little bit modified. A block of wood, perhaps four or five inches long, has a hole bored in it, may be an inch and a half in diameter. Near the bottom a small tube is put through the side. The mouth is placed over the large opening, and the smoke is blown out through the small tube. Tobacco is used exclusively, and friend France buys a cheap grade of it by the wheelbarrow-load, if not by the wagon-load. A very little smoke from tobacco, of course, does a very large business with cross hybrids; and friend France has more cross hybrids than any other man in the State of Wisconsin, without question. I at once suggested that his boys would learn to use tobacco by having the mouth so near tobacco smoke. Imagine my surprise, then, when told by friend France that he never used tobacco in any shape. One of his boys admitted that he used tobacco, but he said he did not think that the tobacco smoker had any thing to do with it. This thing is certain, however: A young man who is breaking away from the bondage of tobacco would find it a pretty hard matter if he kept on using friend France's *tobacco smoker*.

When I first arrived I found a good deal of fault with friend France's plans, just as

I did with Dr. Miller's: but after two days of questioning, and practical experience with his hives and fixtures, I began to think that, for extracted honey exclusively, friend France might have decided on the very best arrangement, especially for out-apiaries as far away from home as his are. Those immense hives will hold all the honey safely, in case he should have trouble about getting around promptly. The bees never starve, for he winters them with the whole 36 large frames; and when they come to raising brood in the spring they never lack in stores. I am very much inclined to think these great hives have an amount of brood in spring, right along year after year, that we shall seldom get with small hives; and this is one reason why I am very loth to give up the ten-frame Langstroth and adopt the eight-frame. Dr. Miller has cut down all his hives to eight-frames; but he winters entirely in the cellar. Of course, friend France lets his great shot-tower hives stand right where they are placed, winter and summer; and he has no fussing to do from the time honey ceases in the fall until it commences again in the spring. Of course, he does not extract very closely in the fall, preferring to leave them too much rather than not enough. Now, dear reader, before going any further with my Notes by the Way, I want to ask you to read My Neighbors.

MYSELF AND MY NEIGHBORS.

Thou shalt not bear false witness against thy neighbor. Ex. 20: 16.

July 16.—While waiting for the train at Woodman I have just had one of the pleasantest visits of my trip. I found some bees belonging to an old gentleman between 80 and 90. While talking with him I noticed an old gray-haired grandma, standing in the back doorway. I wondered if it was likely she would care to talk with A. I. Root; but it has always taken a little effort on my part to make advances toward an acquaintance, even with old people, and I thought once I would not crowd myself into their home. Then the thought came, that, if it were Prof. Cook, he has such a gift that way, he would easily and naturally get acquainted and entertain her. I walked toward where she stood, and very soon her face broke into a smile as she asked if it were indeed true that A. I. Root had visited their home. She is a devoted Christian, and soon I had heard about her children and grandchildren, and especially about one son—the one who first started them with the bees. He succeeded with the bees, became a storekeeper and then postmaster, but finally left their little town of 30 or 40 inhabitants, and went west, where he is still prospering, for he is a God-fearing son.

"Grandma" insisted that I should go down into their cellar and see where "grandpa" did the work. The cellar was dry and clean—yes, cleaner and sweeter and nicer than most of the extracting-rooms I found among a good many bee-men. But I might say this and not say a great deal either; but

this underground extracting-room was a cool and pleasant place wherein to sit down and talk. During exceedingly hot weather I could imagine that it was a very nice place to work, and bees are not very much inclined to go down into a cellar. Before leaving, the old couple, with another son and his wife, with grandchildren, gathered under the trees in front of the little cottage. In my poor way I tried to strengthen their faith in the great Father, and also in their fellow-men. I gave them some suggestions on "what to do, and how to be happy while doing it."

When I got into the town of Woodman I was told I should have to stop three hours. There are only two bee-keepers there; but the landlord told me that six miles further on my road, at Boscobel, there were a great lot of them. Accordingly, after an hour's pleasant chat with the bee-keepers there, I employed a man to take me ahead to the next town, that I might waste no time. He hadn't the change for a five-dollar bill, so I went into a store. The storekeeper did not like to spare his change, but suggested that I might get it at one of the saloons. Now, the town of Woodman has only about thirty or forty inhabitants, probably; but there were two buildings nearly if not quite as large as the dry-goods store, devoted to the saloon business. I told him I did not like to go into saloons, even to get change. I suggested that two saloons for so small a town were about too many; but he did not agree with me. He further added, that people *need* not go into saloons unless they choose, and that, if nobody went into them, there certainly would not be any. My friends, I want you to hold that idea right in your minds. If nobody goes into saloons there will not be any; and if you stop now patronizing and encouraging them they will very promptly stop existing.

Men whom you find around railroad stations carrying passengers, driving hacks, or keeping livery-stables, are not, as a rule, I believe, *godly* men. I do not know just why it is so; but I am sorry that I have found it so; but it seems to be the rule. Of course, I commenced getting acquainted with this new friend, as I always do, while we were on our six-mile trip. I told him I was the editor of a bee-journal, and we talked about bees and honey. Then I spoke of the nice old couple I had just left. Said he:

"Mr. Root, you would hardly believe it, but those old people cheat so fearfully by putting sugar in their honey that nobody will buy it any more."

Of course, I expostulated; but he declared the more vehemently that everybody knew it, and seemed to think that was much the way with people who read the Bible, and sing and pray. I plead for Christians, as I always do. He afterward informed me that these old folks had a son, some little time back, who was a notorious cheat. He kept the store and postoffice. He was right smart, of course, and *got rich* by cheating.

"Why," said he, "it was amazing, the amount of sugar that man had shipped into town. Even the station agent said the quantity was unheard of for a town the size

of Woodman; and what else could it be used for except to manufacture something they called honey, and then make believe the bees gathered it?"

I presume most bee-keepers will readily surmise that the sugar our enterprising young bee-man and storekeeper had brought in was to feed his bees, and keep them from starving during drouths and poor seasons. But his neighbors, especially those who did not know him intimately, would have it that he was manufacturing honey. May be it was wicked, but I led my companion along until he had given the whole family a regular setting-out; then I stopped him.

"My friend," said I, "I have let you talk, and now I want to teach you a lesson. How much does nice white sugar sell for in the town of Woodman?"

He said he did not know exactly, but probably about 10 cents.

"Very good. Now, do you know what they are retailing honey for in your town?"

He saw the trap he had got into, and did not answer. I went on:

"These friends of whom I have been speaking are selling beautiful basswood honey, even by the single pound, for only eight cents. Now tell me, pray, how anybody can buy sugar for 10 cents and put it into honey for which they get *only 8*." He was used up; but he made a faint plea that he was *sure* they put sugar in the honey when the sugar was cheaper and the honey was higher.

Now, dear friends, it is not only the men who drive stages and liveries that are guilty of bearing "false witness" against their neighbors in just the way I have indicated. *You and I* are both guilty of uncharitableness, and of being in haste to think evil in just this line. If I were riding with you an hour I think I could convince you of it, and without question you would have a chance to reprove me, providing I kept talking, as I should be pretty sure to do. It is just this kind of work and just this kind of spirit that have brought things to such a pass as to get these false statements in the papers in regard to comb honey being made of glucose and paraffine. As a rule, I believe that those who lack in education and culture are most guilty. Traveling among people at large, with the right spirit in the heart, helps one to overcome this habit.

Not many days later, another man carried me, with a pretty span of colts, eight or nine miles over the hills. His charges were very reasonable, and he was in many respects a nice old gentleman; but he gave me a glimpse of one of the worst cases of "bearing false witness" I have ever met. Of course, he found out in a very short time that I was a Christian. Then he warmed up and "went" for me. His good wife was present, for she went along for the ride. I turned to look at her face, and it expressed so much trouble as she said, "Please don't; it can't do any good," that she had my earnest sympathies at once. I breathed the little prayer, "Lord, help," and then "went" for him. He attacked professing Christians, declaring "our land was *not* a land of

liberty,* and then pitched into ministers. He said one of their best and biggest ministers around there was detected in horse-stealing, and that five horses were found in his possession. His wife looked pained, and shook her head. Then he said that he had some neighbors across the way who belonged to the church, and read the Bible, and prayed, and sang hymns, yet their children would steal like every thing.

"Oh! no, Mr. F., you must be mistaken."

"No, I am not mistaken. They stole my iron wedges; and every thing they can get their hands on they steal and carry home."

"But, my good friend, their parents certainly would not approve of their stealing. If they knew it they would most assuredly make them carry your iron wedges back again, or any thing else."

"No, they don't. They just encourage them in it, and teach them to steal more."

"My friend, it is possible that a *man* may be so depraved; but I am sure that no *woman*—no mother of a family of children—can go to church, and *sing* and *pray*, and at the same time encourage the children in stealing. Either the stealing would have to be dropped, or else the prayer-meeting would. The two can not possibly exist long together; and the same way with the man who belonged to a gang of horse-thieves. He might have been a good minister once; but when he commenced dishonesty, either the religion or the dishonesty *would have to go*. 'Ye can not serve both God and mammon.' For nearly an hour I repeated text after text. I hurled them at him like clubs, but of course I did it smilingly. He dodged and evaded, then started out on a new track; but I could see that I was gaining ground. I told him of the pious old couple who were accused of adulterating eight-cent honey with ten-cent sugar, and plead for the charity that "thinketh no evil." His wife looked more hopeful, and he, poor man, began to *admit* that all humanity except *himself* are not hypocrites. As I reached my destination he said something more about the Bible being the work of man. As I extended my hand to him in parting I said, "Mr. Fiddler, do you think it was a human voice, and was it in a line with humanity as we find it all around us, that uttered the words, 'Love ye your enemies, do good to them that hate you, *pray* for them that despitefully use you and persecute you?' Don't these words savor more of God than of man? and does not the very thought savor more of *heaven* than of earth?"

He smiled good-naturedly; and as I shook hands with them both I felt that my poor plea had not been altogether in vain; and as I walked down the lane to another bee-keeper's home, it was not altogether the hum of the bees above my head that made me feel buoyant, joyous, hopeful, and happy.

"Thou shalt not bear false witness against thy neighbor."

* The man who has no faith, either in God, his neighbor, or his country, is but a step away from anarchy.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

A VISIT TO J. M. SMITH, OF GREEN BAY, WIS.

DEAR friends, since I last wrote you I have made a visit to J. M. Smith, of Green Bay, Wis., the great horticulturist and market gardener of the State.

All that I saw that was interesting to me during that half-day would almost make a book. Friend Smith has 40 acres of land under the highest state of cultivation, and now covered with wonderful crops of vegetables and small fruits. He keeps an accurate account of his daily receipts, and these have been averaging for the past few weeks just about \$100 a day. Of course, he employs a large amount of labor—perhaps 30 or 40 full grown men; then there are enough boys to make quite a little Sunday-school, especially if we include the girls also, who were picking berries. Friend Smith first began on a single acre. His growth and progress were, as it usually is, by easy steps. When he made a single acre produce great nice crops, another acre was added to it, and so on. His first step was to thoroughly underdrain his ground. His soil is not naturally good—not as good, perhaps, as yours and mine; but it was all he had, and he started out to make the best of it. His ground is so near on a level with Lake Michigan that he can not, by doing his best, get a fall of more than one inch to every hundred feet of tile; therefore you may be sure the underdraining was carefully done.

Now, besides the careful underdraining I was agreeably surprised that friend Smith has decided just as I have done, that we need surface draining also. The underdrains are about two rods apart, and right over them he has surface drains through all his 40 acres. This makes his ground in beds about two rods wide. These beds are highest in the middle, and slope gradually toward the surface drains. The surface drains are so shallow the cultivator or loaded wagon crosses them without difficulty. During the present season, when we have had such excessive rainfalls, I knew our ground was injured by becoming so saturated with water that it settled down just about as hard as it was before it was plowed. It was worth my whole trip to Green Bay to satisfy myself on this single point of surface drainage as well as underdrainage. Of course, the crops were all in long rows parallel with these surface drains.

Considerable has been said about cropping ground continuously, without seeding it down and turning under the sod. Even Peter Henderson recommends that market-gardens be rested occasionally. Now, friend Smith does nothing of the sort. In fact, he says he could by no manner of means spare his expensive highly manured ground for a crop of clover only to be turned under. Although his season is so much shorter than ours, he gets two and often three crops on the same ground every season. For instance: On his first acre of ground (which was so mellow and rich one could kick his foot down six inches or more, almost any-

where) I found young currant-bushes just commencing to bear. Between these, onions had been grown, and the boys had just pulled them, piling them in these shallow surface drains so as to be out of the way. Let me say, these shallow surface drains also make convenient narrow roads, or by-paths, for gathering the crops. Well, the great white onions were piled here in long winrows, where they could dry out; and just as soon as they were up, the ground was manured again, the manure cultivated and worked in with modern tools, then the celery was planted.

Friend Smith plants celery or cabbages when he gets ready, no matter whether it rains or not. The hottest day I have experienced this season was Thursday, July 18; and during this day, friend S. with his boys set out about two acres of cabbage-plants. While I was wondering that they dared to set them out during such a fierce heat, one of the boys came up and suggested that it would be only a waste of time and shoe leather to replace what cabbages had died. None of them died worth speaking of. I expressed a curiosity to see how it was done. While friend S. has never had facilities for irrigation to any great extent, he has a tank and windmill. The tank would hold perhaps 200 barrels. In different places on his ground are hydrants covered by square wooden boxes. When transplanting celery or cabbages during very dry weather, a common iron pipe, perhaps 200 or 300 feet long, is attached to the hydrant, and carried along these surface drains. Then a hose, perhaps 100 feet long, is attached to the iron pipe. By means of the iron pipe and hose, barrels of water stationed all along the paths (or, rather, surface drains) are readily filled with water. Then the small boys, by means of watering-cans, put a pint or quart of water in the hole where each cabbage-plant is to be placed. The plant is then put in, then some soft dry earth pulled over the wet surface, to prevent baking. In this nice, rich, highly manured soil, cabbage-plants take right hold, and grow, rain or no rain; and the same way with celery. Wagon-roads go through the grounds at intervals, and baskets and wheelbarrows bring the products along the paths I have mentioned, to the wagon.

Another thing about these surface-drain paths: I was told that I could hardly find a weed on friend Smith's whole 40 acres. Our good friend was obliged to own up, however, that, during the past season, the excessive rains had made the ground so wet many times, at the same time making the weeds grow so fast, he had got behind, like many of the rest of us. The weeds, however, were being rapidly cleaned out. They were all thrown into these surface-drain paths, then pitched into carts and carried to the compost heaps in various parts of the grounds. I did not see any weeds going to seed, and I presume that none were allowed to mature. On one piece of ground I saw about 3000 currant-bushes. Each bush was an extra-fine one, about like a few you have seen and can remember.

On this extra highly manured and well-

drained ground, the currants were of immense size, and bush after bush was bending with its beautiful load of fruit. Why, I should not be surprised if they got almost a whole bushel from some of the bushes. They were far enough apart so that they had sun and air enough to ripen thoroughly. His crop of strawberries was about 250 bushels per acre; but he plants the old kinds, the Wilson and Crescent.

With his soil and his method, the new kinds do not answer so well. In talking about underdraining, where you can get a fall of only one inch in 100 feet, I asked him if he had a scientific engineer to lay out the work.

"Not at all," said he; and he added, "whatever you do, do not ever get a scientific engineer to help you lay your under-drains."

He manages a good deal as Terry does. He gets down into the ditch, and lays the tile himself; and, if I am not mistaken, he pours water into all the ditches to be sure that it will run off before he lays the tile.

Of course, he keeps quite a number of pigs to consume the refuse; and I was very much pleased to find that he had been keeping cabbage refuse in a *silo*. All the leaves left where the heads are gathered, and all the poor or immature heads, are put into this *silo*; and he showed me a fine sow that he said had had nothing else for months but cabbage from the *silo*. This cabbage was put away last fall.

I do not remember now how many horses he keeps; but there are something like a dozen. He also has some fine cows. His stables are as neat and clean as any I have ever visited.

Green peas is one of his special crops; but when the market will not pay him a certain price, the vines are cleared from the ground, and peas, vines and all, are given to his pigs, and so with almost every crop. In order to have enough to supply the demand, he often raises fine crops to go into the compost heap or to the pigs. For instance, I saw a fine bed of Henderson's New York lettuce—beautiful, crisp, large-sized heads; but as lettuce is very perishable, and there is no market for it just now, he said the whole crop must go at once into the compost heap. Of course, such things do not happen very often; but it is better for the market-gardener to have too much than not enough. I shall in future touch upon incidents of my visit, probably, quite often.

July 29.—At the present writing, the Henderson lima beans are making nice little pods in great abundance. I am sorry to say that two or three of the Kumerles are going up the poles lively. The most of them, however, behave considerably like the Henderson bush lima.

The boys sold all the berries at good prices in my absence; and now there is a good demand for something for pies. A currant-plantation, such as I saw at friend Smith's would be a big investment in Medina just now. We are getting 12 cents a quart for blackberries, and the market is not half supplied. We need four times as many as we have now. Green apples for

making pies would also be a fine thing if we had them.

Notwithstanding the repeated rains there is an excellent demand for all kinds of garden stuff. The Stratagem peas and wax beans still sell readily at 40 cents a peck. Where people once become acquainted with Stratagem peas there will be a good demand for them all summer long. This season our Stratagems are true to name. We have not found a bogus one among them.

GARDENING FOR AUGUST.

I have before mentioned the sad sight that most of the gardens presented that passed under my eye during my recent trip. Many of the lawns and front yards were beautiful to behold; but the back yard and vegetable-garden, whenever the railroad gave us a view of them—oh my! what a sight! Faded, wilted, and useless crops; weeds; pea-vines and potato-tops, and every thing else that was displeasing to the sight, seemed to be the rule. In a few places I saw the refuse cleaned up, and neat bright-green rows of celery taking their place. But these were the exception and not the rule. At Green Bay, in the vicinity of friend Smith's wonderful work, there was a different order of things. Such a man's example is contagious; and in front of the stores and groceries of Green Bay I saw the neatest assortment of garden vegetables I ever saw anywhere. The sight would have done credit to the market places of our great cities early in the morning.

Now, friends, it will pay you just as well to make garden in August as it will to make it in April and May. Let us see what can be done with the ground now cumbered with weeds where your early peas, potatoes, and other crops have been growing. Celery is always in order under such circumstances. A nice strawberry garden in July and August is a thing of beauty, and I saw just such a one at Boscobel, Wis. It belonged to one of our bee-men, and I believe he bought the plants of A. I. Root. If you have water at your command you can put out asparagus roots in August. You can sow the seeds, any way. Purple-top Globe turnips, or White Egg, are seldom without a purchaser. Now is the time to sow the seed. Wax beans, in our locality, will give a good crop if we have the usual amount of rain. The Eclipse beets will also make nice beets for the table, and most markets will use a large amount of them. If you have very strong large plants of Jersey Wakefield cabbage, if set now in the ground with plenty of manure, they will make nice heads before winter. Early carrots also usually do fairly when sown the first of August. Corey's Extra Early corn may make roasting-ears, if we have plenty of rain and a warm fall. If it does not, it will pay cost for fodder for your cow. Cress usually does nicely if sown now. Cucumbers for pickles rarely fail when put in by the first of August, and you may fill your whole garden with these and do well. Most kinds of lettuce will give a good crop late in the season, if sown now. Onion seed for onions for bunching, or onion-sets, if there is plenty of rain, will also answer. If you did not get

out your *Egyptian* onion-sets in July, they will do almost as well if put out now. Parsley will be right for winter, if sown in August. Alaska, or American Wonder peas will probably give at least a few before frost. All kinds of radishes, and especially the winter radishes, will give a crop. Spinach is just in time to make large bushy heads, without running to seed; and it will usually stand without protection until Christmas or later.

There, haven't I made out a pretty good list for gardening, for the month of August? Now, you can have your choice—a nice beautiful garden where every thing grows from the word "go," or an unsightly crop of weeds and rubbish. The seeds of the weeds (if the latter are allowed to go to seed) will make you trouble as long as you live on the place. If you do not do any thing else, mow them down or cut them off with a scuffle-hoe, and burn them up. Kill the weeds, even if you do not raise a nice crop.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

MEDINA, AUG. 1, 1889.

In my Father's house are many mansions: if it were not so, I would have told you. JOHN 14:2.

We have 8939 subscribers.

THE HONEY FLOW.

We had a slight flow from basswood. It was good while it lasted, but ceased abruptly after three or four days, and then robbers began to make their unwelcome appearance.

A POINTER FOR EXTRACTED-HONEY PRODUCERS.

SQUARE cans are now actually cheaper than new kegs or barrels, and the return freight no higher than on kegs. Remember, the cans are adapted for any climate, and they do not shrink or swell like the wooden packages.

HONEY FROM RED CLOVER.

HONEY is coming in again (July 31st), this time from red clover. In the supers of some of the stronger colonies, the bees have begun to store honey. With the amount of rain we have been having we may get something from this source.

J. M. JENKINS.

We have had a very pleasant visit from J. M. Jenkins, Wetumpka, Elmore Co., Ala. He represents our establishment in the South, and reports an unusually good year for bees. Friend Jenkins is alive to the bee-keeping interests of the South, and no doubt has done as much, or more than any other man for the advancement of modern apiculture in Dixie.

MUCH ADO ABOUT BEES.

OUR correspondence has grown at such a rate that our *letter postage alone* now costs us, on a close estimate, \$1000 per year, to say nothing of the cost of stationery and printing, directing, etc. Verily, there is much ado about bees in other ways than through the medium of conventions and bee-journals, and it will take more than falsehoods about manufactured comb honey to squelch it.

SEASONABLE "LOOK OUTS."

LOOK out for robbers. Look out and don't leave a comb of honey leaning against the hive over night, nor a cover not tightly fitting. Look out for that honey-house door. Put a sign on it in big letters, YOU SHUT THE DOOR. Look out for the entrances of small nuclei. Look out when robbers get started while you are working over a hive. Close up and go to another part of the apiary. Lastly, take a lookout over the apiary to see if all is well. Leaving a comb outside by mistake, may result in a horse being stung, and the loss of the horse, or, possibly, the loss of human life may follow. I have just had a tussle with "old Charlie," because one of the boys left a comb leaning against a chaff hive over night.

BEE-KEEPING NOT A NUISANCE.

OUR co-worker, Thomas G. Newman, of the *American Bee Journal*, Chicago, Ill., has gotten out a pamphlet relating to the Z. A. Clark case, in Arkadelphia, Ark., entitled "Bee-keeping Not a Nuisance." The whole history of the case is given in full. Those who desire full information on the subject can obtain this pamphlet free of charge, either of us or by applying to the editor of the *American Bee Journal*, as above. Inquiries still come in as to how to join the Bee-keepers' Union, the entrance fees, etc. The entrance fee is \$1.00, and that pays for the dues for the unexpired year. The annual dues are \$1.00, and must be paid within six months to retain membership. The fees and dues must be sent directly to the General Manager, T. G. Newman, 925 West Madison St., Chicago, Ill., who will record the names and send receipts.

MY TRIP TO WISCONSIN.

I REACHED home on Thursday, July 25, after an absence of just two weeks. There are many things I should like to tell you all at once, but I have thought best to preserve them for future issues. I will say this, however, that the basswood yield of Richland Co., Wis., was fully up to all that it has been represented. The day I visited friend Freeborn, he brought in a load of 1800 lbs. of honey, and his boys brought in from another apiary, the same day, 1400 lbs. If I am correct, this yield was from less than 500 colonies, and was all gathered in about three days. Friday morning the hives extracted first were full again, and the boys were at work extracting when I came away. I am told that they never have poor seasons in Richland County—that is, there is always at least a fair crop of honey. They have had trouble in wintering, however, like the rest of us; but they seem to have got pretty well the upper hand of it now.

ITALIAN BEES AND QUEENS.

One untested queen, 75c; three for \$2.00; one tested, \$1.25. Bees by the pound and nucleus.

16d H. G. FRAME, North Manchester, Ind.

In responding to this advertisement mention GLEANINGS.

ITALIAN QUEENS by return mail; tested, \$1; untested, 75c. LEININGER BROS., 16tfdb Douglas, Putnam Co., Ohio.

THE REVISED LANGSTROTH, and DADANT'S FOUNDATION. See advertisement in another column.

SPECIAL BARGAINS.

In looking over our stock we find the following lot of old-style honey-packages, which we offer at these very low prices simply because they are remnants of stock that we should like to dispose of:

Eleven 50-lb. round tin cans with handles and 1½-inch screw caps. Old price 50c. Will sell for 30c.

Nineteen 100-lb. round tin cans, with handles and 1½-inch screw-caps. Old price \$1.00; will sell for 60c each.

Seven 100-lb. cans as above, with a rim added to bottom; also an extractor honey-gate; very handy for retailing from. Old price \$1.75; will sell for \$1.50. Japanned and lettered "Pure Honey," 50c extra.

"Iron-Jacket" Honey Cans.

These are what we used to sell and recommend before we began to use the square cans. They are strong, and don't need to be boxed to ship when full. We have some of the 3 smaller sizes, which we offer as follows:

15 1-gal. cans, old price, 25c; will sell for 20c
37 2 " " " " " 38 " " " 30
34 3 " " " " " 47 " " " 40

If you take the whole lot of any one size of any of above cans, you may deduct 5 per cent. If you take the whole of 3 or more sizes, 10 per cent may be deducted.

BOX 41.

G. H. KNICKERBOCKER,

Pine Plains, Dutchess Co., N. Y.

In responding to this advertisement mention GLEANINGS.

For Sale Cheap.

4 H. P. Engine and Boiler, Complete, \$180.
B. W. Payne & Sons Eureka Safety Power.

Almost new. Now at Higginsville, Mo. Who wants this bargain?

We have also to sell at a bargain a 1 H. P. Shipman coal-oil engine. It was a second-hand which we sent to the factory and had made over new. Is now as good as a new engine. We offer it for \$80. For any one who wants only a small power it is a bargain. Price of a new one I believe is \$125.00.

A. I. ROOT, Medina, Ohio.

KIND WORDS FROM OUR CUSTOMERS.

I received the queens in fine condition, not a dead bee in either cage.

G. W. CAMP.

Armona, Cal., July 10, 1889.

The honey tumblers you sent me were received with but one cracked in the barrel. I am well pleased with them.

A. L. KILDOW.

Sheffield, Ill., July 8, 1889.

The bees arrived yesterday in good condition. I am much pleased with them. The queen is a good looker. If she will raise bees like those sent with her she is all right.

D. H. ZEPPE.

Nokomis, Ill., July 26, 1889.

GOOD ADVERTISING.

Please do not insert my advertisement in your issue for Aug. 1, as I directed, for I am getting behind on orders. It will take me until about Aug. 8th to catch up with orders.

J. P. MOORE.

Morgan, Ky., July 22, 1889.

[No wonder, friend M., when you send out such nice queens.]

The bill of goods, shipping-bill, and remittance, reached us in good order last Monday. The bee-hat and veil, as well as some other conveniences, went immediately into service, and are just right. Even this "glorious Fourth" is made brighter by the hammock.

WM. A. ADAMS.

Eaton Rapids, Mich., July 4, 1889.

The extractor I ordered of you, which was shipped July 2, I received in good order. It has been thoroughly tested. I don't see where you can make any improvement in it. We think it a model of perfection. I much prefer your gearing to any up-right gearing I ever saw.

F. M. PECK.

Spring Green, Wis., July 31, 1889.

You requested us to renew if we had found GLEANINGS a good investment. We have found it so, and should not like to be without it, as we are beginners in bee-keeping, and have found many articles which have helped us in our work with the bees. We started this spring with 4 colonies; they have increased to 10. From one frame of brood, ½ lb. of bees, and untested queens received from you July 28, 1888, we have now 3 strong colonies, which are the best workers we have. The seasons so far has been too wet for much honey; but the weather is drier now, and we may have a good fall flow. We wish GLEANINGS success, as a journal of its kind should have.

BURK BROTHERS.

Burrell, Pa., Aug. 6, 1889.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.*—Market is rather unsettled yet. We quote extracted, California, at $7\frac{1}{2}$ @8c; orange bloom, $7\frac{1}{4}$ @ $7\frac{1}{2}$; common Southern, $6\frac{5}{8}$ @ $7\frac{1}{2}$ c per gal. White clover and basswood, extracted, $7\frac{1}{2}$ @8c. As to prices for comb honey it is too early yet to form an opinion.

Aug. 10. F. G. STROHMEYER & Co.,
New York.

CHICAGO.—*Honey.*—Receipts of comb honey are quite up to the present demand, which is by no means active. Sales are made at 14 @ 16 c for one-pound sections. Extracted is selling quite well at from 7 @ 8 c, and the receipts are not accumulating to any extent.—*Beeswax* is scarce and in good demand at 25c.

Aug. 8. R. A. BURNETT,
161 So. Water St., Chicago, Ill.

BOSTON.—*Honey.*—We have received quite a little new honey since writing you last, and we find it of very good quality. We are selling from 17 @ 18 c. Sales a little slow on account of warm weather. Extracted selling from 8 @ 9 c.—*Beeswax*, 25.

Aug. 9. BLAKE & RIPLEY,
Boston, Mass.

KANSAS CITY.—*Honey.*—New crop is coming in slowly; 1-lb. sections, white clover, 16 c; 2 lb., white, 14 . Extracted, white clover, 9 c in 60-lb. cans; dark, $6\frac{1}{2}$ @ 7 . Demand light.

Aug. 9. HAMBLIN & BEARSS,
Kansas City, Mo.

CINCINNATI.—*Honey.*—Demand is good for comb honey in 1 and 2 lb. sections, at 12 @ 15 c in a jobbing way. Trade is good also in extracted honey in square glass jars for table use, and in barrels for manufacturers; it brings 5 @ 8 c on arrival.—*Beeswax* is in good demand at 20 @ 22 on arrival for good to choice yellow.

Aug. 9. CHAS. F. MUTH & SON,
Cincinnati, Ohio.

COLUMBUS.—*Honey.*—The arrivals of honey are more liberal. Owing to the high prices at which it is held, it is moving slowly. We are trying to get 16 @ 17 c for choice goods in pound sections. A number of our best customers claim that they can buy it for less money from outside parties.

Aug. 8. EARLE CLICKENGER,
Columbus, Ohio.

NEW YORK.—*Honey.*—Extracted in very good demand at the following prices: Orange blossom, per lb., $7\frac{1}{4}$ @ $7\frac{1}{2}$ c; white clover and basswood, 8 @ $8\frac{1}{2}$; off grades, Southern, per gal., 6 @ 7 c. We have some new comb honey which we quote as follows: Fancy white, 1-lb. sections, unglazed, 16 c; off grades, 1 lb., 14 c; fancy white, 2 lbs., glazed, 14 c; off grades, 2 lbs., 12 c.

Aug. 12. HILDRETH BROS. & SEGELKEN,
New York.

ALBANY.—*Honey.*—Some inquiry for new honey, no receipts to speak of yet. Light, comb, 15 @ 18 c; dark, 12 @ 13 . Light, extracted, 8 c. H. R. WRIGHT.

Aug. 8. Albany, N.Y.

ST. LOUIS.—*Honey.*—Market quite dull. We quote extracted, bright, $5\frac{1}{2}$ @ 6 c; dark, 4 @ $4\frac{1}{4}$.—*Beeswax*, 23 $\frac{1}{2}$.

No. 16.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.
PUBLISHED SEMI-MONTHLY BY
A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid in the U. S. and Canada. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries not of the U. P. U., 42 cts. per year extra.

OUT-APIARIES, NO XII.

NUMBERING HIVES—RECORD BOOKS.

IN the main, the management of an out-apiary does not differ from that of any other; and after years of experience you have had in the home apiary you are pretty well settled in your plans. I will, however, offer some suggestions to any whose experience is yet very limited, as to some of the things that may be especially appropriate for out work, and you can judge whether any of them are worth adopting, for you. Some things, too, may come up that would never be needed in home work.

In numbering hives it will probably be found convenient to adopt some system by which the numbers can be easily changed. A satisfactory way is to have tin tags painted white, with black figures on them, fastened on the hives with half-inch wire nails.

231

TAG FOR NUMBERING HIVES.

About 4 x 2½ inches is a good size, with figures two inches long, so that they can be plainly seen at a distance. These tags can be easily changed from one hive to another, and with out-apiaries you may find it very convenient, if not necessary, to change them quite frequently.

It is well to adopt some system of numbering by which you can tell, from the number, to which apiary a colony belongs. A good way is to let the first numbers belong to the home apiary, then the next series to another, and so on. This will be very satisfactory if you never run higher than 100 in

each apiary, for then you can tell at a glance that 87 belongs in the home apiary, 187 in the Wilson apiary, etc. If you expect that, before fall, some of your apiaries may contain as many as 125 colonies, then it may be well to let the numbers 1 to 125 belong to the home apiary, 126 to 250 to Wilson's, 251 to 375 to Hastings, and so on; but in that case you may not think so quickly whether 380 belongs to the third or fourth apiary. An easier way to distinguish would be to let the first apiary run from 1 to 200, and the second from 201 to 400. An objection to this whole plan is, that you may feel unpleasant some day to have some one, on seeing a tag marked 240, ask you, "Why! have you 240 colonies?" when in fact you have only half that number. A way to avoid this is to commence at the number 1 at each apiary, preceding it by an initial letter. Then two hives, marked "H 87" and "B 87," would be recognized as belonging respectively to the home and the Belden apiary. On the whole I think I prefer the simple figures. If you bring all your bees home to winter, you need pay no attention to numbers, but place them next spring indiscriminately. Thus you may find the first row in the home apiary commencing with the numbers 42, 17, 183, 260, and so on. Their new numbers are to be 1, 2, 3, 4, but the old numbers should be left on till you have entered them on your record book for this year, and transferred any item you may wish to keep about them, which will usually be only the age of the queen, noting in the new record the number they had the preceding year, so that you can at any time trace back their history. After your record is all straight, then take off all tags and number the hives in order. I am well aware that many of our best bee-keepers do not keep any record book, but have little slates on hives, or a system of stones, etc. I suspect, however, that at least some of them, after establishing out-apiaries, would find advantages in the record system that did not exist so

long as only one apiary was kept. If you have only a single colony, you will probably remember all about it without book, slate, or stone.

As the number of colonies increases, the demand becomes more imperative for some aid to the memory. Still, with even a hundred colonies I knew my colonies somewhat as I would know a herd of cows, and a glance over the apiary would bring to mind pretty well the condition of the different colonies, and what was to be done. But when it comes to having more than one apiary, especially if there are several, you can't run out and in five minutes see what shape you left any hive in at last visit. With the record-book you can sit at home and look over the condition of all your apiaries, and on a rainy day you can do this just as well, when you would not like to be out looking over your slates. It is sometimes pleasant and profitable to look over the records of past years, and a comparison of them in long winter evenings may be of some value.

A 20 cent blank book makes a good record-book, and it will be found convenient to have a pencil tied to it with a string. A pencil is better than ink, for it may sometimes get wet. C. C. MILLER.

Marango, Ill.

There are some things in favor of the book plan. The fact that the condition of the apiary may be noted on a rainy day, and preparations and plans be made for work when the weather clears up, is quite an item in its favor. As you know, we use slates on each hive, and do not make use of numbers. Since we have had the apiary located at the basswood orchard, we have been filling orders for bees and queens from this place. Sometimes we have gone down with the horse and wagon, and taken with us an order-book. Not knowing the condition of the apiary, any more definitely than memory would indicate, we found that, on several occasions, we were unable to fill the orders which we expected to, at that apiary; and even after having arrived there, in order to find out where a two-frame nucleus or a select tested queen could be obtained, we might have to glance over the slates of perhaps two dozen hives before we found what we wanted. This entailed the necessity of carrying with us a smoker, shipping-box, etc. With the record-book we could have determined beforehand just where the order could be filled; and instead of running all over the apiary, have made a bee-line for the spot. On several occasions I have gone into our home apiary and made some alterations in one or two hives, in the absence of our apiarist, Mr. Spafford. As we have no numberings to our hives, I could not tell him in the office when I saw him next which hives I had changed, other than by a certain bungling circumlocation which might be something after this fashion:

Mr. Spafford comes in in the morning, and inquires after the work, when this conversation takes place:

"Oh! by the way, before you came this morning I filled an order for an untested queen, in the north apiary—let me see—in the third row from the north side, fourth hive from the end, counting from the west."

Mr. Spafford looks at me a little puzzled,

"In the north apiary, you say?" he repeats; "in the fourth row, and—"

He has gotten it wrong, and I interrupt him by saying the *third* row. Several times, as I could not tell directly, I have had to go out and point out the hive. Now, then, if the hive had been numbered I could have said, "From No. 123 I have sold a select tested queen. From No. 206 I took out a best imported." Knowing the location of the various hives, or about where the various numbers should be, he can make a bee-line for it. To the former he can give a cell or hatched queen, and the latter he can start to raising cells. If we should adopt the book plan, I should not care to dispense with the very convenient slates. If the two could be combined in some way, I should like it better. As to the numbering of hives, I am sure it is a convenience many times. ERNEST.

HONEY STATISTICS

FROM ALL PARTS OF THE UNITED STATES.

In order to read understandingly the reports given below, it will be necessary to observe the following points: First, the State is given; then next in their order are the names of the reporters, with their respective postoffices. To indicate locality, the usual abbreviations are used—N. S. E. and W., for north, south, east, and west; N. E. for north-east, etc. The letter C indicates the word "central;" E. C., east central, etc. In the following list, the first figure represents the month, and the second figure the date at which the report was rendered. The small letters, a, b, c, d, etc., indicate the answers to the questions propounded in questions a, b, c, etc., just below.

WE decided to send out the same set of questions that we did a year ago last July, in order that we might the better get the comparative results of the two seasons. Although the entire honey crop has not been taken off the hives in all localities, yet a report is rendered which shows quite decidedly which way the wind blows, as affecting the price of honey and the average production throughout the United States. The questions which we submitted are as follows:

- (a.) What is new comb honey selling at in your vicinity?
- (b.) What is new extracted honey selling at?
- (c.) What per cent of an average crop of honey do you estimate has been secured in your vicinity this season? Please answer this question simply by per cent; for instance, 50, 75, 175, or 200 per cent.
- (d.) How many pounds of honey, both comb and extracted, have you taken from your bees, and from how many colonies so far?
- (e.) Was the season with you this year good, average, poor, or bad?

ARKANSAS.

W. H. Laws, Lavaca. W. C. 8-10.
a. 15; b. 15; c. 75; d. 1000 from 80 colonies.

ALABAMA.

W. P. W. Duke, Nettleborough. S. W. 8-6.
a. 15; b. 10; c. 200, or a full crop of white honey; d. 3000 lbs. comb from 40 colonies; e. good.

J. M. Jenkins, Wetumpka. C. 8-1.
a. 10 to 15; b. 7 to 10; c. 100; d. 100 comb, 650 extracted, 16 colonies; e. average.

ARIZONA.

Jno. L. Gregg, Tempe. C. 8-5.
a. 10 to 12; b. retail 6, wholesale 5; c. 40; d. 190 colonies have produced 20,280 lbs.; e. rather poor.

CALIFORNIA.

W. W. Bliss, Duarte. S. E. 8-7.
a. 12½, wholesale, 15 retail; b. 7 to 8; c. 40; d. about 7500 lbs., 150; e. poor.

G. W. Cover, Downieville. N. 8-7.
a. 20; b. 20; c. 100; d. 1000 lbs. comb from 33 colonies; e. good.

CONNECTICUT.

Daniel H. Johnson, Danielsonville. E. 8-2.
a. 20 to 25; b. 18 to 20; c. 20 or less; d. 50 lbs. from 4 colonies.
Nothing from most of them; e. poor.

FLORIDA.

J. L. Clark, Apalachicola. S. 8-6.
a. 10; b. 9; c. 200; d. nearly 5000; 68, spring count; e. excellent.
John Y. Detwiler, New Smyrna. E. C. 8-5.
a. None produced; b. retail 10; c. 25; d. 1st extracted Island
apiary, 36 colonies, 1000, amber honey; extracted home apiary,
75 colonies, 20 hives, extracted 500. Balance allowed to fill up
in expectation of poor season. Colonies deficient in strength
from continual depredations of mosquito hawks during three
weeks of drouth. e. Poor.

GEORGIA.

T. E. Hanbury, Atlanta. N. 8-1.
a. From ruins 18. No section honey. b. 15; c. 200; d. 20 colo-
nies, 100 each; e. good.

J. P. H. Brown, Augusta. E. C. 8-9.
a. 15; b. 10; c. 50; d. about 500 lbs. from 10 colonies that were
kept especially for this purpose. The balance of colonies
were run for queens. e. The first part of the season was very
good, while the latter part is very poor.

Walter McWilliams, Griffin. W. C. 8-3.
a. 15; b. none offered; c. 175; d. 40 per colony on an average;
run for queens; e. good; fine prospects for fall crop.

ILLINOIS.

Reuben Havens, Onarga. E. 8-12.
a. 15; b. 12; c. 10; d. none; 40 colonies; e. bad.

Frank Howard, Fairfield. S. 8-7.
a. 25; b. 10; c. 25; d. 100 comb; spring 15, now 35; e. bad.

C. C. Miller, Marengo. N. 8-2.
a. 15; b. none; c. 75; d. 5000 from 245; not all off yet; e. nearly
average. On the road to Belvidere, on the trot. I'm burned
her dress again; anti-spark-smoker anxiously awaited.

Mrs. L. Harrison, Peoria. W. C. 8-3.
a. Wholesale 10 to 12; retail, 12; to 15; b. about the same,
for a choice article; c. 100; d. about 2000; 76 colonies, spring
count; e. average.

C. Dadant, Hamilton. N. W. 8-3.
a. 15; b. 10; c. 150; d. 35,000 from 400 colonies; e. very good.

INDIANA.

T. H. Kloor, Terre Haute. W. C. 8-12.
a. 15 to 16; b. none in market; c. 25; d. 1800 lbs. from 60 colo-
nies; e. poor.

Mrs. A. F. Proper, Portland. E. C. 8-2.
a. 20; b. none extracted on market; c. 10; d. 200 from 55 colonies;
e. very bad.

Joe. A. Burton, Mitchell. S. C. 8-1.
a. 15; b. 8½; c. ½; d. 500 from 13; e. poor.

I. R. Good, Nappanee. N. W. 8-3.
We have not secured one particle of honey; and there is
none in the market. This is the poorest season we ever had
since I kept bees.

IOWA.

A. Christie, Smithland. W. 8-5.
a. 15 retail; c. 100 retail; c. 100; d. Have scarcely yet com-
menced taking off honey; e. very early, good. In fruit bloom,
cold and bad, necessitating feeding; later, average.

Oliver Foster, Mt. Vernon. E. 8-2.
a. 15 retail; b. 9 retail; c. 100; d. 2000 extracted, 500 comb;
from 350 colonies. Most of the crop is still on the hives. e.
average. My locality overstocked.

J. M. Shuck, Des Moines. C. 8-3.
a. 15; b. none selling; c. 100; d. I don't know; e. good.

Eugene Secor, Forest City. N. 8-1.
a. 15 and 16; b. 10; c. 90; d. have taken off but little. Have
"in sight" 1500 from 40 colonies in spring; e. average, nearly.

Z. T. Hawk, Audubon. W. C. 8-7.
a. 20; b. none on the market; c. 10; d. 50 from 20 colonies.
All comb; e. basswood and clover season bad. Fall season
just opening. Ask us later.

KANSAS.

B. F. Uhl, Boling. 8-4.
a. 16; c. 100; d. 50; e. good.

G. L. Hall, Burlington. 8-1.
Honey crop. My own, none. Pasture poor.

KENTUCKY.

D. F. Savage, Hopkinsville. S. W. 8-2.
a. 20; b. 10; c. 50. Fall honey will probably be very abundant.
d. 50 comb, 300 extracted; from 30 colonies. e. Bad, very bad.

Jno. S. Reese, Winchester. C. 8-1.
a. 15; b. 15; c. 150; d. 1500 from 12 colonies; e. extra good.

J. P. Moore, Morgan. N. 8-2.
a. 15; b. 10 to 11; c. 175; d. My whole apiary was devoted to
queen-rearing, except 2 colonies. They filled about 25 L. combs
each, making about 125 per colony. e. Good.

LOUISIANA.

J. W. K. Shaw, Loreauville. S. C. 8-7.
a. None sold in quantity; b. 75c per gal. at retail; c. 100 per
cent spring; d. little; 105 lbs. per colony to July 15; e. good.

H. L. Lewis, Oxyka. Miss. E. 8-6.
a. 15; b. 80c per gal.; c. 175 per cent; e. extra good.

MAINE.

J. Reynolds, Clinton. S. E. 8-7.
a. 20; b. 17; c. 20; d. 500 comb from 40 colonies; e. very poor;
too much wet.

C. W. Costellow, Waterboro. S. W. 8-5.
a. 30; b. 20; c. 50; d. run for increase entirely. e. Poor.

S. H. Hutchinson, Mechanic Falls. 8-1.
a. 30; b. none in market; c. 50; e. poor; too wet.

MARYLAND.

S. Valentine, Hagerstown. N. W. 8-6.
a. 15 to 20; b. none in market; c. about 35; d. one yard 2663
from 90 stands. e. Poor; too much rain.

Simon P. Roddy, Mechanicstown. 8-5.
a. 20; b. 15; c. 75; d. 400; 20 colonies; e. poor.

MASSACHUSETTS.

J. E. Pond, No. Attleboro. S. E. 8-6.
a. 25 to 30; 18 to 20 in 10 to 15 lb. lots; b. at same prices at re-
tail; c. 50 to 75; d. none, as I have only experimented; e. good,
early, wet and poor through June till present time.

E. W. Lund, Baldwinville. N. C. 8-5.
a. 22; b. none in market; c. 20; d. 150 comb; 20 colonies; e. bad.

Wm. W. Cary, Colerain. N. W. 8-3.
a. 16; b. 10; c. no surplus gathered; bees in almost starving
condition. Poorest season since 1866. d. None, and am feed-
ing now to prevent starving; e. very poor.

MICHIGAN.

A. J. Cook, Lansing. C. 8-1.
a. 15 to 20; b. 10 to 12½; c. less than 25; d. we have not taken
our honey off yet; e. poor.

George E. Hilton, Fremont. W. 8-1.
a. 15; b. 10; c. 25; d. 1500; 20 colonies; e. poor.

James Heddon, Dowagiac. S. W. 8-1.
a. 16 to 20 retail; b. 10 to 12; c. 25; d. from 200 colonies here,
about 2000; e. the worst season on record; very bad.

R. L. Taylor, Lapeer. 8-5.
a. b. No price established; c. 25; d. 4000 comb honey from 400
colonies; e. very poor.

H. D. Cutting, Clinton. S. E. 8-3.
a. 16; b. 10; c. 75; d. 25 comb from 65 colonies. But honey is
not quite ready to come off; will take off in about 10 days; e.
poor.

W. J. Carroll, Otsego. S. W. 8-10.
a. 16; b. 10; c. not more than 50; d. extracted 450, comb 100;
about 40 colonies. e. poor; prospects for fall honey good.

MISSISSIPPI.

W. A. & E. E. Montgomery, Pickens. 8-6.
a. 10; b. 7; c. about 50; d. haven't kept a record of how many
pounds; e. poor.

MISSOURI.

Jno. Nebel & Son, High Hill. E. C. 8-5.
a. 10 to 15; b. 5 to 8; c. 65; d. 2500 extracted, 700 comb, from 52
colonies; e. average season so far. The fall flow is often as
good as from white clover.

E. M. Hayhurst, Kansas City. W. 8-3.
a. 15 wholesale, 20 retail; b. 10 wholesale, 15 retail, c. 150; e.
good.

James Parshall, Skidmore. N. W. 8-3.
a. Retailing at 12½ to 15; b. 10. I sold one barrel at 9; c. 200;
for we never yet got any surplus before August until this sea-
son; d. 1500; 34 spring count have 72 now; e. extra good.

Chas. L. Gough, Rock Spring. E. C. 8-8.
a. 15; b. 10; c. 25; d. about 40 lbs. extracted; e. bad.

S. E. Miller, Bluffton. E. C. 8-5.
a. 15 to 16; b. 10; c. 45 to 50; d. 1250 extracted, 125 comb, from
37 colonies, spring count; e. very good. Expect a good flow
of fall honey.

MINNESOTA.

A. F. Bright, Mazeppa. E. 8-5.
a. 15; b. 10; c. 100; d. 3000 from about 80 colonies; e. about
average.

D. P. Lister, Lac Qui Parle. W. C. 8-2.
a. 20; b. 12½; c. 75; d. 750; basswood 27; e. good, if bees were in
proper condition.

J. H. Johnson, Fairmont. 8-9.
a. 20c at retail; b. don't know of any in market; c. 100; d. 40
lbs. each from 15 colonies; e. average so far.

Wm. W. Hamilton, Jackson. 8-1.
d. Eight pounds from 3 colonies; e. good for swarming, poor
for surplus in basswood bloom.

N. P. Aspinwall, Harrison. C. 8-3.
a. 15 to 20 wholesale, 20 to 25 retail; b. none on the market; c.
100; d. 650 comb; 20 colonies. Season not over; e. good. In-
crease 100 per cent.

NEBRASKA.

Jerome Wiltse, Falls City. 8-5.
a. 16 to 20; b. 16; c. 100; d. 800; 52; e. good.

A. E. Maley, Auburn. 8-10.
a. 20 to 25; b. 15; c. 85; e. very good.

J. W. Porter, Ponca. N. E. 8-2.
a. 20 and 25; b. 12½ and 15; c. 10; d. 400; 130 colonies; e. very
bad for surplus honey.

NEVADA.

E. A. Moore, Reno. W. C. 8-6.
a. 15 to 25; b. 16; none here only what I have; c. 175 per cent,
d. about 800 lbs. comb, 1200 extracted. e. Very good; I shall prob-
ably get 1500 lbs. more if it is not too dry.

NEW HAMPSHIRE.

S. F. Reed, No. Dorchester. C. 8-5.
a. 20; b. 15; c. 50; d. 100, from 5 run exclusively for honey; e.
very bad so far.

C. E. Watts, Rumney. C. 8-3.
a. 25; b. 25; c. 10. d. have taken only one finished section from
8 colonies yet; e. poor.

L. A. Freeman, Lancaster. N. W. 8-7.
a. 20; b. there is none in the market; c. 100; d. perhaps 100
from 4 colonies; e. good.

NEW JERSEY.

J. D. Coles, Woodstown. S. W. 8-3.
a. 20; b. none; c. 75; d. 25 per colony; e. average.

Watson Allen, Bernardsville. N. C. 8-3.
a. 18; b. 12; c. 10; e. 200 lbs. from 50 colonies; e. very bad.

NEW YORK.

G. M. Doolittle, Borodino. C. 8-3.
a. b. No market here for honey; c. 25; d. the little I have is mainly on the hives yet; e. poor.

H. P. Langdon, East Constable. N. E. 8-8.
a. 20 to 25; b. 12 to 15; c. 75; d. 3000 extracted from 60 colonies with 100 per cent increase; e. poor.

Frank Boomhower, Gallupville. E. C. 8-1.
a. No price, no honey. Have not seen a pound of comb honey so far this season; floods of rain; bees have done nothing so far; c. d. 0; e. bad.

M. G. Young, Highland. 8-7.
a. b. Have sold none; c. 30; d. about 800 comb from 40 colonies. e. Poor.

NORTH CAROLINA.

Abbiott L. Swinson, Goldsboro. E. 8-5.
a. 10 to 12½; b. none here; c. 90; d. 50 comb from one hive. Others run for queens; e. average.

OHIO.

Chas. F. Muth, Cincinnati. S. W. 8-5.
a. 12 to 14 for best in a jobbing way; 20 retail; b. 9 to 10 for best by the lb.; 15 retail; c. perhaps 75; d. about 800 from 28 colonies, spring comb; e. poor.

S. A. Dyke, Pomeroy. O. 8-1.
a. 12½; b. none; c. 100; d. 75 from 2 hives; e. good.

Dr. H. Besse, Delaware. C. 8-2.
a. 20; b. 18; c. 100; d. about 600; 40 colonies; e. good.

Dr. G. L. Tinker, New Philadelphia. N. E. 8-1.
a. 18; b. 15; c. 100; d. 1000 of comb, 500 ready to extract; from 25 colonies; e. average.

PENNSYLVANIA.

Geo. A. Wright, Glenwood. N. E. 8-8.
a. 12½; b. 10; c. 75; d. my honey is still in the cases; e. fair.

S. W. Morrison, Oxford. S. E. 8-2.
a. 25; b. 12; c. 50; d. apiary engaged in queen-rearing; e. honey very abundant, but too wet; e. bad.

Thos. C. Davis, Idlewood. C. 8-2.
a. 20; b. 20; d. 500 comb from 12 colonies. Will extract 600 from 13 colonies. Increase, 50 per cent.

RHODE ISLAND.

A. C. Miller, Providence. E. 8-3.
a. b. None on the market, either old or new; c. 100 to 125; d. 225 from 3; others not heard from; e. good.

SOUTH CAROLINA.

W. J. Ellison, Stateburg. C. 8-6.
a. 12½; b. 8 and 10; c. apiary 1, 50; apiary 2, 100. Only kept a record of 9 in apiary 2—74; c. apiary 1, bad; apiary 2, good; five miles apart.

J. D. Foose, Coronaca. 8-5.
a. 10; b. 8 to 10; c. about 50; d. 350 extracted from 12 colonies; e. average.

H. T. Cook, Greenville. 8-3.
a. 10; b. 20; c. 150; e. good, till in July.

TENNESSEE.

C. C. Vaughn, Columbia. C. 8-5.
a. 15; b. 8; c. 75; e. poor.

Gaston E. Cartmell, Jackson. W. 8-7.
a. 10 to 15; b. none in market; c. 25 or less; d. not 5 to the colony; 50 colonies; e. bad.

TEXAS.

J. E. Lay, Hallettsville. S. W. 8-5.
a. 15; b. 10; c. 25; d. unfinished; e. poor.

L. Staehelhausen, Selma. S. C. 8-10.
a. 10; b. 8; c. 50. d. 10,000 extracted; 2000 comb from 200 colonies; e. less than average.

J. P. Caldwell, San Marcos. S. W. 8-6.
a. 10; b. 8; c. 25; d. 200 from 20 colonies; e. the worst within my knowledge.

VERMONT.

Howard J. Smith, Richford. N. C. 8-2.
a. 20; b. 12; c. 100; d. 50 comb honey per colony; e. good; the best ever known.

A. E. Manum, Bristol. W. 8-5.
a. b. No price yet; c. 30; d. about 15,000 comb from 500 colonies; e. poor.

F. M. Wright, Enosburgh. E. 8-5.
a. 18 and 20; b. 13 retail; c. 50; d. 2500; 50 colonies; e. average.

J. W. Porter, Charlottesville. C. 8-5.
a. 12½; b. 10; c. 120; d. 1500 from 30; e. bad for me; my bees have foul brood.

Will Thatcher, Martinsburg. W. C. 8-2.
a. 10 and 12½; b. none in market; c. 10; d. 1500 or 1600 tiered on 40 colonies; e. not average.

J. E. Crane, Middlebury. W. 8-10.
a. 15 to 18; b. 10; c. 50; d. 6000 lbs. comb and 200 extracted from 200 hives, one half of my bees; e. season poor.

VIRGINIA.

H. W. Bass, Front Royal. N. 8-8.
a. 12½; b. same; c. 65; d. has been so wet that our honey is not finished, and we have taken but 1000 lbs. off as yet. Never knew bees to seal up honey so slowly, it is so thin and watery, on account of so much rain.

WEST VIRGINIA.

J. A. Buchanan, Holliday's Cove. N. 8-1.
a. 15 to 18; b. 15; c. 50; d. 6000 extracted from 100 colonies; e. below average.

Jno. C. Capehart, St. Albans. S. W. 8-1.
a. Nice—20; b. 10; c. 25; d. 10, average of 20 colonies; e. poor and bad.

M. A. Robley, Milton. S. W. 8-6.
a. 15; b. none; c. entire failure; 2 per cent; d. 25 from 62 colonies; e. bad, badder, baddest.

WISCONSIN.

J. C. Sayles, Hartford. S. E. 8-10.
a. 14; b. 7; c. 150; I worked for increase; e. good.
S. I. Freeborn, Ithaca. S. W. 8-2.
a. 12½; b. 8; c. 100; d. 300 colonies; 32,000 extracted, 200 comb; e. good.

Frank McNay, Mauston. C. 8-3.
a. 12 to 15; b. 8; c. 100; d. 20,000 from 350; e. average.

E. France, Platteville. S. W. 8-3.
a. 16; b. 8 to 10 retail; 7 to 8 wholesale; c. 75; d. 26,000; 530; e. good but short.

Joshua Bull, Seymour. E. 8-2.
a. 15 wholesale, 18 retail; b. 8 wholesale, 10 retail; c. 100; d. 2500 nearly all comb from 40; e. average.

TOO LATE FOR GENERAL CLASSIFICATION.

A. A. Sanborn, Westfield, Mass. S. W. 8-7.
a. b. None in market; c. 4 to 5; 6 to 8 lbs. from one colony; e. very bad.

J. P. Israel, Olivenhain, Cal. S. 8-8.
a. 7 in San Diego; b. 5 to 5½; c. 20—honey season is ended; d. 2500 lbs. from 80 colonies; e. bad, very bad.

On account of the cool wet weather in the early part of the season, which, according to the reports, seems to have pervaded almost all of the United States, the honey-crop is considerably less than it might have been. First, because this weather continued clear up, in a good many of the places, into the time of year when the main nectar-bearing flora was in bloom. Second, the bees were unable to breed up properly on account of the cool and rainy weather, and hence the actual working force of the bees was considerably lower than it should have been. But in spite of all this, the season has been decidedly better than last year, in most localities, although there are some exceptions.

Twenty States report a good season: namely, Alabama, Arkansas, Georgia, Illinois, Iowa, Kansas, Kentucky, Louisiana, Minnesota, Missouri, Nebraska, Nevada, New Jersey, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Wisconsin, Arizona.

The following States report a poor season generally: California, Connecticut, Florida, Indiana, Maine, Maryland, Massachusetts, Michigan, Mississippi, New Hampshire, New York, Tennessee, Texas, Vermont, Virginia, West Virginia.

Michigan, though usually among the foremost, gives as unfavorable a report as any of the States enumerated.

It is interesting to note that a number of States report 200 per cent as the average crop of honey received. W. P. W. Duke, of Alabama, and J. L. Clark, of Florida, report 200 per cent, while a large number of others give 175 per cent as the average crop. Taking it all in all, we find that the average per cent of question C, as to what has been the average crop of honey secured in the respective localities, stands 75 per cent. The same average a year ago was only 50 per cent; so that, according to the reports, 50 per cent more honey has been secured this year than last, although the general average is still down.

Perhaps we should remark, that the report has probably been underestimated rather than the reverse. The tendency of human nature, and especially when its hopes are set high, is to look down instead of up. Farmers, as well as bee-keepers, are much inclined to complain about the poor season, too much drouth, or too much wet, or something else that is not just exactly right.

MARKETING HONEY AT COMMISSION HOUSES.

SOME FACTS NOT TO THEIR CREDIT.

NERETOFORE I have marketed my honey in barrels, 50 gallons each. From year to year I shipped two or three barrels and managed to retail the remainder at the small towns within 25 or 30 miles of my apiary. Last year everybody who kept bees had honey for sale at about 5 cents per pound. It has been my observation, that box-hive bee-keepers cut out their comb honey, carry it to town, and sell it for what they can get, and pay 25 cents per gallon for black sorghum for their family to eat, that is hardly fit for hogs, and do without during half of the year, unless they raised the sorghum. In that case they have sorghum all the year, provided they can not sell it. I can not hope to have a home market under such circumstances. Last year I extracted 10,000 lbs. of honey, and for the want of a market I left all the supers full of comb honey, which would have amounted to about 4000 lbs. if I had extracted it.

I made a mistake somehow, and realized less for my honey than some previous years with a much less crop. I have a barrel of my last year's honey on hand yet. I shipped two barrels of honey to D. G. Tutt & Co., of St. Louis, about two or three months ago. It was horsemint honey, and had granulated. It was capped over before I extracted it. I never raised better or sweeter horsemint honey. Tutt & Co. wrote to me, in a few days after shipping it, that it had soured, and that one of the barrels had been burst in transit, and that they sold the remainder at 5½ cts. per lb. I got \$30.00 for the two barrels of honey. If such transactions as that would not burst a bee-keeper from shipping honey, I should like to know what it would take to break him from sucking eggs.

When I commenced writing I did not think of writing more than an order; but since I have mentioned carrying over comb honey in supers I will tell you how I lost a good customer a year ago last winter. I carried over 1000 lbs. in supers to the following spring. The winter was very cold, the thermometer going down to zero one day and night, and my honey granulated in the hive. I always carry over some comb honey in supers to the following spring for weak colonies and swarms. I did not use it all for that purpose, and the first two or three barrels of extracted was mixed with granulated honey. I thought it the best honey I ever extracted. I liked it better than all-liquid honey. I got an order from Colorado City for a barrel of honey, and it so happened that I shipped one of the barrels mixed with granulated honey. The parties wrote immediately to know what was the matter with it. They said it had granulated. They never saw granulated honey at that season of the year before. I honestly explained, but could not satisfy them, and have not had an order from them since.

I sent a sample of granulated honey to a friend in Mills County, Texas, last winter. I am not sure that I know what the bees gather it from; but when first extracted it is almost as clear as pure water. The dry granulated is as white as the whitest sugar (I extract from one to three barrels of that kind every year). He wrote me that the merchants said they did not want it; that it was not honey; that they never saw honey as white as that;

that it was artificial honey, or that I fed my bees on something to produce it.

In the fall of 1881 I had five weak colonies that I fed. I have not fed since, except one frame of honey stored by bees. When spring opened in 1882 I had two weak colonies, about one pint of bees each. I have at this writing more than 200 colonies. I have extracted over 500 gallons this year. I don't know any thing about bad years for bees and honey in Texas. Since my failure in 1881, every year has been good, some better. Texas is a land of honey. God has in a special way blessed it with honey and bees—and with men, too, who love black thick sorghum better than honey, and who have been educated to hate the bee.

E. Y. TYRRAL,

Co. Judge of Milam Co.

Cameron, Tex., July 29, 1889.

Friend T., I am afraid you are a little too severe on our friends Tutt & Co. Perhaps they made a mistake in calling the honey sour, instead of having a disposition to cheat. I know there is quite a disposition to suspect bee-men of adulteration and fraud, or of feeding bees something to produce honey; and when we think of the tirade of falsehoods that are constantly being published in this direction, can we really blame them? I do not know what more we can do than to keep on fighting these mischievous falsehoods. We want to get stanch men in every community to stand up squarely and steadfastly—men who will not be weary in contradicting and explaining. Personal interviews with the editors, I do believe, is going to be the next work before us. Who will enlist in the work?

MANUM IN THE APIARY WITH HIS MEN.

VISITING NEW HAVEN APIARY, LET OUT ON SHARES TO H. B. ISHAM.

GOOD-MORNING, Henry, and good-morning, Mrs. Isham."

"Why, good-morning, Mr. Manum. I had nearly made up my mind that you had forsaken us entirely. Just think of it! You have not been here since the first of May. I was telling Henry only yesterday that I believed the loss of your good wife, and the past three poor seasons, had so discouraged you that I feared you were neglecting your business. Well, I am very glad to see you once more."

"Thank you, Mrs. Isham. But I have been here once since May, though I did not see you. I only called at the apiary a few moments to see Henry and the bees; and as to neglecting business, I never looked after the bees any more closely than I have this season. Why! the three past poor seasons have nerved me up to the highest point of ambition; and I am toiling on with all my might, in the endeavor to regain what I have lost in the past three years in dollars and cents. The loss of my good wife, it is true, has cast a gloom over my home, which loss I can never regain while I remain in the body. But when I reach the other shore I expect to regain what I have lost. Although I am not a professing Christian, yet I believe—yea, I know—my wife still lives, and I believe it is well with her; and when my work here is done, I too

shall be 'born again' from this to a higher life. Hence I try to take a philosophical view of the matter, and to do the very best I can while I am permitted to remain here. You know, Mrs. Isham, our views differ somewhat in regard to religion; and as I am in something of a hurry, we will not discuss the matter now.

"Well, Henry, how are you getting along with the bees?"

"Very well, except in one thing. I want you to come to the apiary with me, and I will show you a pitiful sight. There, just look on the ground and see the bees crawling around. They are all over the apiary in this way. They seem to have lost the use of their wings. They come out of the hives in the morning, apparently to go out to work, and try to start; but they seem to be unable to rise, and then they walk off on the ground and in the grass,

Cook all about it, and sent him some of the affected bees, and I hope he will be able to give us some light on the matter. You wrote me that you could spare a few combs, and I guess I will take, some as we need them in some of the yards. Well, Henry, I must say that you have taken good care of them, so far as keeping the worms out of them; how did you do it?"

"Simply by looking them over often and picking out what worms I could find, and then hanging the combs on these racks, and placing each comb one or 1½ inches from the others, when, if I had placed them close together, it would have been impossible to keep the worms out."

"Well, there! I have all I can carry this time. Now I want a few combs of brood, if you have any hives that can spare it. I have drawn on my home bees all I dare to at present; and as your bees have

MR. MANUM AND HIS HELPERS.

and are lost. They are dying by the thousand every day; in fact, so many die that there is a very offensive smell in the apiary, caused by the dead bees. Can you tell me the cause of all this?"

"No, Henry, I can not. I have observed it in my home yard and in three others. I notice only the young bees are affected—that is, those that seem to have just commenced to work. I have picked them up and tossed them into the air to see them fall to the ground like so many peas. I also notice that their wings are perfect; none of them have ragged wings as old bees have, nor do they appear to be sick. I have caged some of them, and kept them caged four days without their showing any signs of being sick; but upon liberating them again they could not then fly. I fear this will cut our honey crop short from what it would have been were it not for this trouble, because the colonies are becoming very light in bees. I have written to Prof.

not swarmed very much, there must be some that would be benefited by taking away a card or two. I want the brood with what young bees will adhere to the comb for making more nuclei. By carrying the bees so far from their home, I find they stay much better than where they are used in the same apiary. There, I think I have now about all the load I can carry. How does the solar wax-extractor work?"

"Nicely. See what a nice cake of wax I have taken from it. Why, it will pay for itself several times over this year."

"Here, Mr. Manum, here is a bouquet for you that I have just made."

"Thank you, Mrs. Isham. How pretty it is! I noticed your flower-garden when I first came. I see you love flowers as well as ever. I shall place this bouquet on my wife's grave as I pass by the cemetery on my way home."

"Yes, do. I thought of her when I was making it. Good-by."

"Good-afternoon, Whittier. Here are a few young queens I have brought you to introduce here where you have killed off old ones. They are daughters of that choice queen I have talked so much about. They are very promising young queens."

"Sure enough, Mr. M., they are beauties in form, though I have seen much brighter-colored queens."

"It is not the *color* I am after; it is the *quality*; though the old queen's workers show the three bands yet, instead of being a bright yellow they are nearly brown; but they do get the honey, and that is what I want."

"There, I promised you a picture of that group of my bee-help, taken three years ago, and here it is.

tons of comb honey in one-pound sections. The next season (1886) the apiary contained 117 colonies, and she got only 250 lbs. of not very nice honey. She has since passed to the other shore.

"The next is Charles McGee, who commenced to work for me when I first started the supply-business. One day I got him to go to my then only out apiary to help slingle the new edition to the honey-house, it being a slack time in the shop, and at the height of the swarming season he became wild with excitement in seeing swarm after swarm come out; 15 swarms issued that day. Finally, while we were eating our lunch at noon he offered me \$5.00 for the next swarm that came out, which offer I accepted. In a few moments out came a very large swarm of pure Italians. I put them in a box, and

MANUM'S SIDE-HILL APIARY.

The first one on the right, standing near the row of Chapman honey-plants, is E. O. Tuttle. He is a young man from Massachusetts, who worked for me six seasons. He is somewhere in New York running a photograph gallery. The next is Duane Weatherbee, of Moriah Center, N. Y. He was with me two seasons, and is now at home on his farm. The next is Leslie Bissonette. He commenced to work for me when a mere boy, packing sections in boxes for shipment. He worked his way along up until I sold my supply business to Drake & Smith. He was my foreman. Since then he has worked for me at the bee-business.

"The next is Mrs. Eugene D. Sturdivant, a widow lady who had charge of one of my apiaries two seasons. The yard that she ran for me in 1885 contained 96 colonies, and she took from that apiary five

at night he carried them home. He now has about 175 colonies in two apiaries, and is a very successful apiarist.

"The next is Henry Isham, who has been with me off and on for over 25 years. For the past six years he has run my New Haven apiary on shares. He has half of the honey, without any increase of the bees. He does all of the work there, such as keeping the hives painted and repaired, etc. I furnish all supplies at cost, and he pays for half; he also pays for half the sugar fed to the bees.

"The next two are your humble servant and his son Fred—at the extreme left. Fred has taken but very little interest in bees until the past two or three years, since which he has run one of my apiaries during the honey season, and he is doing very well indeed; but even now he prefers to handle

horses, and work on the farm, rather than to work among the bees.

"Now I have explained this picture, I will present you this one, which is a view of this apiary you are running, as I make a practice of giving each new man a view of the apiary which he runs for me. This view was taken eight years ago, while Mr. Will Hinds was taking care of it. You will observe that the yard looks very much different now from what it did then, as there were no fruit-trees on the plat at that time, while now the hives are nearly all shaded by pear and cherry trees that I set out here the second year after I located the apiary, and nearly all are in bearing. I located this apiary here by request of Mr. H. B. Williams, who owns the land. He was anxious for me to do so, as he said he believed the bees would be a benefit to his crops. I chose this spot because the ground is descending, as I prefer to locate an apiary on a side-hill when I can, to secure good drainage; and I believe the bees can locate their respective hives much better than on a level plot, especially the young queens when they go out to mate; and as the honey-house is at the lower side of the apiary, I find it much easier to carry the honey down hill than on a level. Again, as each and every hive can be seen from the honey-house, the attendant can be watching for swarms while at work inside; and if a swarm issues he can locate the hive at once. This picture somewhat misrepresents the apiary, as one would imagine by looking at it that the ground is quite descending; but, as you know, it is not any too much so. The picture also represents the hives as being set on the amphitheater plan, when they are not, but instead are set in straight rows. I have three apiaries located on level ground; and I find in the spring, when the snow is melting, that snow-water often settles around the hives, making it too damp for the welfare of the bees. Here I stand in front with a brood-comb in my hands, and Mr. Hinds is a little way further up, with a swarm-catcher in his hands; and a little further up stands Mr. Williams; and a little to the right, standing on the edge of the ledge, is a neighbor's boy; while back of the boy, in the distance, is a mountain two miles and a half away. I am sorry this apiary does not face east or south east, as nearly all my other apiaries do; but instead it faces south-west; however, perhaps the bees do as well as though they faced some other direction, as four years ago Mr. McFarland took from 117 colonies, spring count, in this apiary five tons of comb honey and 500 lbs. of extracted honey, and increased to 176 colonies."

A. E. MANUM.

Bristol, Vt.

Friend M., we are exceedingly obliged, not only for your excellent pictures, which we think our engravers have succeeded wonderfully in copying, but as well for your pen-pictures. The group of helpers is wonderfully lifelike and suggestive. No wonder you enjoy your work. Your boy Fred looks as if he might do a pile of work, and possibly a pile of mischief, if it were the order of the day. We are very glad indeed to see one lady among your number; and it will doubtless be encouraging to her sex to know that she succeeded in getting a crop of honey that would be a credit to almost any of the men-folks. Very likely your helpers have different plans and ways of working; and may be they are as unlike in their disposition as in their looks; but the very

thought of having such a lot of friends, not only willing but capable, round about you, to lend a helping hand, when many duties press, is in itself inspiring. We can not all very well set others at work, for God has given us different talents and abilities; but we can, each and every one of us, be helpful to those round about us; and in my opinion it is right in this line where the greatest happiness and enjoyment come to every human being. "Not to be ministered unto, but to minister." Your apiary on the hillside was a very attractive and suggestive picture to me when I first set eyes on it. In our first apiary, as you may remember, we had a honey-house in the center, and the hives all around it; but although the honey-house had a door at each end, there was always something going on behind the house, which we could not see. For this reason I decided that our apiary at the Home of the Honey-bees should have no building, tree, or other obstruction, in the center. But your arrangement of hives placed on the hillside, facing the honey-house, fills the bill exactly. Providence permitting, I hope to see it some time, friend M.; and may be you or Fred, and perhaps some of the other helpers, if they are not too busy, will go with me to the top of the mountain, away off in the background. Hills and mountains, with running springs at their bases, will probably be hobbies of mine so long as I live; and when I come to visit you, I want you to point out to me all the springs and all the running water that is to be found round about your home.

COST OF MOVING BEES.

FRIEND DOOLITTLE RECONSIDERS SOME OF THE ANSWERS.

WITH your permission, Mr. Editor, I wish to say a few words regarding some of the answers to question 134, relative to moving bees to and from out-apiaries. Dr. Mason's answer to that question was simply astounding to me. Is not the bee-keeper to have any pay for the labor which he or she preforms? He says it does not cost him any thing, generally, to move bees, for he has his own horse, etc. Has he got such a kind of horse that it does not cost him any thing to keep him? If so, I wish he would purchase one of the same kind for me and ship it out here. If he will do this for me, using that same kind of time which he uses in moving bees, that kind which costs nothing, I will say "thanks" to him for his pay, and mean it from the bottom of my heart. The whole thing reminds me of a little incident which happened several years ago, when I was obliged to economize as closely as possible the money which came in from the bees, to make it meet the outgoes which I had to furnish by way of hives, etc.; for I resolved, after the first outlay on the bees in the beginning, that I would not pay out a cent further on them unless they brought it in to me to use for them. Having this in view, I went to see a neighbor who had some nice whitewood lumber, thinking that I could buy it cheaper than I could hire a team and go to the city and buy pine. When I asked the price of the lumber, he said it would be \$30 per thousand feet. When I demurred

a little, and replied that said price was all he could get for his lumber drawn to the city, many miles away, he replied that "he had to go to the city occasionally, and when going he could draw a load of lumber just as well as not, so that the drawing cost him nothing." Seeing my opportunity, I said: "I have been hesitating about buying this whitewood lumber for some time, because I prefer pine at the same price; and as you are going to the city occasionally, I should be pleased to have you put on a load of pine the next time you are there, and draw it back to me on the same terms you draw this whitewood lumber there."

Did he draw it for me? Oh, no! but he said he would do so for \$5.00 a load. Now, Dr. A. B. Mason, it costs you just as much to move those bees as it would to hire it done; hence I say that the cost in moving bees *does* figure in the matter of honey-production at out-apiaries. I believe that it costs the doctor much more to move those bees himself than it would to hire it done; and if he will stop to think a little I believe he will agree with me. Suppose he had put the same energy that he has put into the bees into some other calling in life, say dentistry, would he not have received as good pay for his time as he now receives from the bees? Undoubtedly; for I know of dentists that average their \$10 a day, or at least it is reported that they do. Now, if a dentist (as I believe Dr. Mason is), and having your time fully occupied with that specialty without "dabbling" with bees, how much would it take, doctor, to hire you to move bees for me, were you a near neighbor of mine? The point I wish to get at, is, that every man deserves pay according to the skill and energy which he puts into his profession, and that the bee-keeper is worthy of just as much pay for the skill, energy, and labor performed as he would be were he in any other profession in life.

In answering the same question, the Rambler says that the cost should be about 25 cts. per hour for labor performed by a man skillful enough to do such work as it should be done. I would ask him if he would work for that price during the hurrying part of the season of some four to six months, when many who have put no more thought into their profession than he has in the bee-business, get three times that pay for their labor. I would not. Look at what he expects to do in a little more than four minutes; prepare a colony of bees for shipment or hauling, carry it to the wagon and see that it is properly loaded, go with it five miles, then unload it, carry it to the stand it is to occupy, see that it is properly placed thereon, then take off the fixings that were used in shipping, getting it in proper shape to work during the season; doing all this for less than two cents! Surely bee-keeping must be light and pleasant work, for "the bees work for nothing and board themselves," while it costs only about two cents to do all of the above, where a skillful apiarist is permitted to furnish the muscle. Brethren, let us hear less of this nonsense, else the consumer will ere long think we should give them what honey they want to eat, and bring it around to their doors in the bargain.

QUEEN-CELLS OVER A QUEEN-EXCLUDING HONEY-BOARD.

On page 590 of GLEANINGS for July 15th I see Bro. Stachelhausen says that in his locality, during the homehint honey-flow, queen-cells will be destroyed over a queen-excluding honey-board. I am very much surprised at this, unless by mistake he has

let a queen hatch above, in which case the cells are always torn down which are already built, and those in process of building are deserted; but so long as there is no queen at liberty in the apartment where the cells are, I have never had a single cell destroyed, out of *thousands* so reared, at all times of the year, when bees could fly, and covering a period of over six years. I also have had reports from many who have tried the plan, and Bro. S. is the first one who has ever reported such a thing as a failure in getting queen-cells built and matured over a queen-excluder. I am now having, after our honey season is over, and bees trying to rob, queen-cells built and completed, virgin queens from one to ten days old kept in nurseries, virgin queens hatched and mated, and laying queens doing good work above queen-excluding honey-boards, with the old queen doing duty below, just as I gave in my book, and have been having the same success ever since the basswood opened. By the addition of a little wire cloth, I believe I have perfected the plan of having queens fertilized, as I give in the book, so it will work at any time and in all localities. G. M. DOOLITTLE.

Borodino, N. Y., Aug. 2, 1889.

Very good, old friend. I am glad you have taken up this side of the question. The only plea that can be made in favor of charging nothing for your work with bees, that I know of, is that it is recreation outside of office hours. I think if Dr. Mason had as many out-apiaries, however, as some of the Wisconsin brethren, he would begin to think that the bees were the *business*, and recreation of some other kind would in time be needed. In summing up the expense of any such work, I think the operator should charge the time, or mention the amount of time consumed. Even if it were done nights and mornings, or outside of regular business hours, statements for print should figure in the cost. Our agricultural papers give glowing accounts of what may be done with many of our rural industries, omitting entirely to mention the time occupied, and brain and muscle consumed, for it does take time, brain, and muscle to make a success of any of these enticing industries.

AMONG THE BEE-KEEPERS OF VERMONT.

A VISIT TO J. E. CRANE AND J. H. LARRABEE.

MR. CRANE has an attractive home toward the outskirts of Middlebury. In the rear of the modern house, with its lawn-bordered porches, are connected buildings of similar style containing the stable, work-shop, and honey-room. Here he and one of his men were busily engaged weighing and crating comb honey for market. Crates taking 20 sections were placed upon the scales, and filled, the last few sections being changed until the weight came out even pounds. Piled near by were a lot of filled crates ready to be shipped. Part of the sections were glassed; the rest were in paper cartons, neatly printed with his address.

Mr. Crane, who has long been known as a producer and dealer in comb honey, has probably marketed all together more than any one else in the State, if not in New England, and is, therefore, not

unfamiliar with what the trade demands. He began with a few colonies in 1866, and has followed the changes and improvements up to the present time. As an advanced and experienced bee-master he has few equals. His location, one of the best for white clover, has been favorable to success. At one time, when canal-boats were the means of travel, he took his crop to New York and sold it at a price that would bring a fortune to the extensive producer of to-day.

Although we came rather unexpectedly, he obligingly left his work and showed us about. In an inner room, another hand was sorting and cleaning sections. Here we saw a section crate made to hold the ordinary closed-side section with separators, and which met our ideas nearer than any thing we had ever seen or heard of. It was simple, easily and cheaply made, protected the sections both top and bottom; and by a follower and simple wedge, sections were crowded tightly together. It was a simple box, with solid sides and ends, with slat bottom firmly nailed. Slat were as wide as the narrow piece of section. Movable wood separators were used, and the ends projected into slots sawed in the sides of the case. These were wide enough to give some play. There was no bee-space at either top or bottom of the crate. When on the hive, the space above the frames gives one bee-space beneath the first crate, and none is allowed between the others.

Sections come out cleaner than from any arrangement we had ever seen; and what cleaning is necessary is done with less labor. The tops of a crateful are all cleaned and scraped before removing; and when emptied, and the crates cleaned, they may be loosely filled with the cleaned comb honey, and tiered up in the honey-house to ripen. Blocks may be put under the corners of each case to raise each a little from the other, to give a free circulation of air. It was made to cover the brood-chamber of the large hive he uses. We should be inclined to make it in two parts, so that the outside could be brought to the center when desired. He uses the large Quinby hanging frame, and in the home apiary were many of these hives. Here we were shown some very fine Italian queens. He manufactures a smoker of heavy tin, with double valve to protect the bellows from fire, and which differs from others in many respects.

We were driven to the out-yards, in which we were much interested. They are from three to six miles apart. All colonies were in chaff hives, with movable outer case, although different from what we saw at Manum's. Entrances were level with bottom-board instead of being underneath. Hives were numbered, and arranged in groups of four or five, facing outward instead of in rows. At each yard is a small work-shop. To get the bees out of sections, cases of honey are taken from the hives, placed in a dry-goods box, and covered with a cloth which is occasionally turned. One apiary is located in the edge of a wood where they are protected from winds. The underbrush is cleared away, and we think the apiarist in charge must appreciate the situation in the heat of summer. Queens are kept clipped, and at the beginning of the honey season they are removed to prevent the issue of natural swarms. This plan has been described in GLEANINGS. Mr. Crane, with Captain Hetherington and P. H. Elwood, who have been studying this problem, have adopted it in preference to any other.

Sweet clover is very plentiful throughout this region, the roadsides being covered with it, and it furnishes some honey. In 1868 Mr. Crane commenced to plant alsike clover; and since, many in that vicinity have grown it.

The season of 1869 was one of the best, and he secured 3000 lbs. of comb honey from about 120 colonies. In 1883, 26,400 lbs. from 300 colonies. In 1885 his crop was 23,000 lbs. In 1887, 18,500 lbs.; and last season, from 550 colonies in the spring he secured about 11,000 lbs. of comb honey. During the season, this number in five yards of about 150 colonies each are cared for by himself and three men.

Although long an "advocate of wintering on summer stands," he has lately come out in favor of cellar wintering.

Mr. Crane is of middle age, of good height, spare, rather nervous, and of light complexion. He has a wife and one boy, a bright child of six or seven years, of which he is very proud. He is a prominent Prohibitionist in his town, and is interested in church work. He has followed bee-keeping because his health was not of the best, and he was obliged to give up other aims. For the same reason he does not further extend his operations nor write more for bee-journals. He informs me that the first bee-book published in America was printed in Middlebury, just fifty-two years ago.

Our time being limited, we reluctantly took leave of Mr. Crane and family, and boarded the train for Larrabee's Point, where we hoped to find Mr. J. H. Larrabee at home.

The station is on the Addison branch, between Leicester Junction, on the Central Vermont Railroad, and Ticonderoga. After passing the stations of Whiting, Shoreham, and Orwell, and just before the train crossed the trestle and drawbridge over Lake Champlain, which is here quite narrow, we were dropped at a crossing near which was friend Larrabee's home.

After making inquiries we started off across the fields; and after a half-mile walk reached our destination. Here the bee-keeper's eye at once noted a good number of neatly painted chaff hives, arranged on ground which slopes to the south, from the pleasant and comfortable-looking farmhouse, with its wide front porch and guard of trees and shrubs.

We were heartily welcomed by both Mrs. Larrabee and son, the only ones of the family at home during our stay, which they made very pleasant.

John Larrabee is a bright young man of about 25 years, and is social and very friendly. He has had bees five years, and now keeps 98 colonies, mostly blacks, with a few colonies of hybrids and pure Italians. All are in chaff hives with movable outer cases.

The soil here is a heavy clay, and white clover is very plentiful. There is some basswood on the ridges, and sweet clover abounds on all the roadsides, although the latter, he informs us, gives no surplus. His bees have paid their way from the start. In 1885 he increased from 8 to 18 colonies, and obtained, 500 lbs. of comb honey besides. That season the bees gathered clover honey from the middle of June till the middle of September. In 1887 he obtained from 30 colonies, 2000 lbs. of comb honey. Last season he secured, from 98 colonies, 2300 lbs. His comb honey was put up in cases holding twelve 1-lb. sections, and the quality and flavor were fine.

His home being within half a mile of Lake Champlain, and about opposite Ticonderoga, there is a fine view of the lake, with its passing boats, the old fort on the further shore, and the Adirondack Mountains in the background.

Pawtucket, R. I.

SAMUEL CUSHMAN.

In your opening paragraph you hint at an idea I have often longed for, but did not know that it had ever been made practical; namely, having crates holding an exact number of pounds. Just think of telling your grocery or commission man that your load contains 50 cases of honey, with 20 lbs. in a case, just 1000 lbs.! and you might add that, as the agreed price was 15 cts., he could just hand over his check for \$150, and that would be all of it. Now think of the other plan of having every one of the 50 cases have odd pounds and ounces, to be figured and added and blundered over! It seems to me, however, that it would need quite a little assorting to make them come out right. With an expert hand, however, I do not know but that it might be done. I think that Dr. Miller might do it without very much trouble, especially if he had his wife and sister to handle the sections, without bumping them or making any of them leak.—We remember friends Crane and Larrabee as progressive bee-keepers for many years past. We are glad indeed that you dropped down on them and let us know what they are up to. We are glad to know that they have not been letting the grass grow under their feet, even though they have not given us very much for the journals of late.

WIRE TOP-BARS.

QUEEN-TRAPS, ETC.

NOTICING your foot-notes following A. L. Kil-do's letter on page 632, I wish to say that I began making the Langstroth hive from directions given in father Langstroth's old edition of "The Hive and Honey-bee." In that book you will find that the top-bars are to be made $1\frac{1}{8}$ inches wide; and you will see that, by putting them in a $1\frac{1}{4}$ space, they will be pretty close together. I was very glad to change to one inch, and from that to $\frac{3}{8}$, and found each change beneficial. While it may be true that a few less brace-combs may be built between the top surface of the top-bars, and any honey-board or surplus receptacle above, it is a fact that it by no means prevents a good many brace-combs being built there; but then the worst of it is, they plug in hard combs, or more properly wax plugs, between the edges of the top-bars when put so close together, which makes the frames well nigh immovable. I am very sure that whoever makes any top-bars to frames more than $\frac{3}{8}$ wide will regret it. Some 12 years ago I experimented quite largely with making top-bars so thick that the right-angled sides ran down toward the bottom of the hive $\frac{3}{8}$ or $\frac{3}{4}$ of an inch before the V began. I liked these bars very much because they were stiff, and bees were less inclined to build brace-combs either between or above them. Still, they would build more or less. I should use such bars now were I not using frames wired with full sheets of foundation which I consider preferable to

every thing else, and $\frac{3}{8}$ is the right width for the Langstroth frames, and $\frac{1}{8}$ less for the Heddon frames.

QUEEN AND DRONE TRAP.

This subject has interested bee-keepers to no small extent. On page 22 of my book is illustrated and described the best trap of the kind which, to my notion, has yet been devised, and yet I have abandoned it. On page 637, last GLEANINGS, in your foot-notes to Query No. 137, you pen the following: "With the Dovetailed hive we have lately been using an ordinary queen-excluding honey-board between the bottom-board and the brood-chamber. Unlike the ordinary drone-excluders and queen-traps attached to the entrance itself, it causes no obstruction to the bees passing in and out." And you should have added, "To the ventilation of the hive or the air passing in and out." But to show you that I have experimented largely with this principle, and, I believe, ante-dated all others in writing about it, let me refer you to page 104 of my book, written in 1884, and from it I quote the following regarding the "New" hive:

I believe that, by virtue of the style and method of adjustment of the bottom-board, cases, and honey-board, by using the latter, made queen-excluding, we can place them in such a way as to control swarming and flight of drones, without the serious objections realized by the use of entrance attachments, which we have enumerated on pages 22 and 23.

If you place one of the queen-excluding honey-boards on the bottom-board, and the brood-cases upon it, you will preserve proper bee-spaces throughout, and force all bees to pass through the honey-board, in leaving or entering the hive. The drones and queen can not leave or enter the cases. By experiment we found that this arrangement did not retard ventilation, nor in any way disturb the normal tranquility of the colony; but further than this we have not experimented. What shall we do with our imprisoned drones? How can we catch our queens, when they attempt to go out with the swarms?

I have faith in a simple arrangement for catching and holding them imprisoned, in a movable box, adjusted to the side of the brood-chamber, near the front end, but not in front of the entrance; thus in no way retarding ventilation, or egress and ingress of the workers. As soon as perfected and tested, it will be publicly described, and attached to the New hive, if proven a practical success.

I will add, that further experiments with the queen-excluding honey-board below the brood-chamber prove very satisfactory in some cases; yet there is some trouble with it which I will not take space to detail here. However, it is far ahead of any entrance arrangement, in my estimation. I will further add, that it is better to have the honey-board which is used in this position *all metal*, such as I wrote you about when father Langstroth was visiting me a year ago last spring.

Now, as to the "simple arrangement" for catching and holding drones and queens at the side of the hive near the front, mentioned in my book as above quoted, it is a perfect success; and although any one skilled in the art could go on and successfully make it after simply giving the above hint, I will, if you desire, describe it in a future article. That this arrangement is far ahead of any entrance arrangement for the purpose, there is no doubt. Still, I do doubt whether or not, in rapid and cheap honey-production, any of it is of much value; and, further, I wish to add that, in the production of comb honey, queen-excluding is of very little value—perhaps not enough to pay bee-keepers at large for using queen-excluding metal, provided they use the bee-space break-joint honey-board, which

will as surely come into general use among practical honey-producers as did the Langstroth hive.

JAMES HEDDON.

Dowagiac, Mich., Aug. 5, 1889.

Your experience with wide top-bars has been ours almost exactly. I first commenced with a hive made after Langstroth's book, as you did; and I kept making the top-bars narrower until I got down to $\frac{1}{4}$ of an inch. Then I increased their width until we had them $\frac{3}{4}$, and settled down upon the latter dimension as the best for the purpose. Our metal corners were then made just right for the $\frac{3}{4}$ lumber. I know that top-bars very thick up and down do a great deal to discourage brace-combs; but by the use of wired frames, we, like yourself, greatly prefer to have brood in place of the useless wood, as much as we can.

BEE-HATS FOR WOMEN.

BY AN AMATEUR LADY BEE-KEEPER.

AS an amateur bee-keeper I was much interested in Mrs. Harrison's article on "Attire for the Apiary," in GLEANINGS of April 1st. She seems to have found some difficulty in making a suitable hat; and as I have nowhere seen or heard of a hat which so perfectly meets the demand of lady apiculturists as that arranged by Mrs. R. H. Holmes, of Shoreham, Vt., I should like to give the readers of GLEANINGS the benefit of her idea.

MRS. HOLMES' BEE-HAT.

The first thing needed is a wide-rimmed straw hat—mine measures five inches. For the veil, take a strip of mosquito-bar, wide enough to reach from the base of the crown on the outside of the hat to the arm-pits, and long enough to fit loosely around the shoulders, with the exception of about twelve inches, which is of the finest black bobinet lace. Join the ends. Turn in one edge and gather on to the base of the crown. Face the other edge with a strip of cotton cloth, fitting the shoulders tightly. At the back of the arm, attach a strap which passes under the arm and buttons on to the band in front. If necessary, run into the band a cord to tighten, as the occasion may require. The black bobinet is less trying to the eyes than any thing else, and is almost no obstruction to the sight. If properly made

there is no falling in on the neck, and no rubbing of the nose and chin, yet perfect freedom of movement to the head. I wore one last summer, and found it perfectly comfortable, as Mrs. Holmes assured me I would.

MISS G. M. WOLCOTT.

Shoreham, Vt., June 5, 1889.

Miss W., we are exceedingly obliged to you for the description you have given, and also for the excellent photograph you send along with it. Our engravers have succeeded excellently, we think, in reproducing it. We think, however, you would find the silk brussels net, which we use for our bee-veils, still better for the eyes than the bobinet, which you mention.

CUBA AGAIN.

O. O. POPPLETON GIVES US SOME ADDITIONAL FACTS CONCERNING THE ISLAND; BEE-KEEPING AND PROTECTION.

FRIEND ROOT:—On page 585 you ask me some questions which I will try to answer as briefly as possible. Our 50,000 lbs. of honey was sold to a firm in New York at 55 cents per gallon, all round, in bond; that is, Mr. Dussag pays all expenses on it until delivered in a bonded warehouse in New York, purchaser paying all after expenses, including the import duty of 20 cents per gallon. This last item amounted to over \$800, so you and your readers can have some idea how the American idea of protection benefits our own beekeepers. Were that duty taken off by our Government, a few score of our experienced American apiarists could and probably would supply the markets of the States with cheap Cuban honey in a very short space of time. Our former year's crop was sold in bulk to friend Muth, in Cincinnati, he paying prices according to the different qualities.

A large part of the honey produced in Cuba goes to Antwerp, Belgium, where, I am told, it is used in making a certain grade of wine, and where the demand is able to absorb all honey raised in Cuba, but at a price less than is obtained by our beekeepers at home. I do not know any thing about the correctness of this information. A great deal of honey is shipped from here to New York, and re-shipped direct from there to Antwerp, if the market in New York will not warrant paying duty and selling there.

In the third paragraph of the second column, on page 584, you will find your question as to quality already answered. The hive on the scales was only an average colony; that is, it gave about 125 lbs. of honey, which is what the entire apiary, weak and strong, averaged, while some of the best colonies in the apiary gave about $2\frac{1}{2}$ times as much, and, of course, their record, if on scales, would have been about 16 or 17 lbs. on the best days. Mr. Manum's record was probably from one of his very best hives. In studying conditions, etc., I prefer to use the record of an average colony instead of either an extra weak or an extra strong one. I think we are then more apt to reach just conclusions. This is the mistake that has been made here in Cuba, taking into account the work of only the strong colonies in an apiary, instead of estimating from the entire apiary.

Excuse me, friend Root, for smiling at your question about irrigating; but I presume you had California in your mind when asking it. So far as

rains are concerned, Cuba is almost the direct opposite of California. There, not a drop falls for several months during the summer, and no large quantity during the winter. Here, rains come and floods descend, I might almost say daily, during the six hottest months in the year, and the wish is for less irrigation instead of more.

Yes, friend Root, GLEANINGS comes to a spot right here where bees gather honey every month in the year. Last summer, during the short period, notwithstanding our 400 colonies in one locality, nearly 20 of our colonies gathered their own supplies, sufficient to keep brood-rearing going in at least 8 or 10 frames each, and gave from 3 to 5 lbs. of surplus honey each month to their weaker neighbors. With a small apiary of, say, 50 to 100 colonies, I have no doubt but that a small amount of honey could be extracted every month in the year. Bees fairly roar on blossoms of the "royal palm" for half an hour each morning during this the shortest season for honey during the year.

Cuba contains nearly 46,000 square miles—some 6000 more than does the State of Ohio; and from all I can learn, I judge that nearly or quite all of the island will average as good for honey as does this locality, some places better. As we can calculate on a steady annual yield here of from 40,000 to 60,000 lbs., a few moments' calculation will show any one what an immense factor in the world's markets Cuban honey would become were all trade restrictions removed. It will be well for our people to ponder these facts whenever the question comes up of removing our protective duties.

Havana, Cuba, July 31, 1889. O. O. POPPLETON.

MORE ABOUT THAT BEE-DISEASE IN CALIFORNIA.

SOME GOOD HINTS FROM ONE OF LARGE EXPERIENCE.

IN the issue of July 15th, page 583, Mr. W. A. Webster warns the Ventura Co. bee-keepers of the new bee-disease. I am sorry to say that we have had it here for several years, but it has caused no serious apprehensions until recently. There are but three apiaries in the county that have suffered much loss from it as yet. I know of no colonies dying out entirely from it, except in those three apiaries; but they have lost several hundred colonies.

This disease appears every spring and summer, in a very few hives in nearly every apiary in the county; but it has caused no serious alarm until recently. The bees usually get over it themselves; but we do not get much honey from the hives that are so affected. A friend on the Ojai has been experimenting a little with the swarms that were thus diseased. He took the queen out and replaced her with another from a healthy hive. The disease entirely disappeared; and by putting the queen from the diseased hive into a hive that was perfectly healthy, it also became diseased in a very short time. This experiment was tried on only one or two hives in the same apiary. I will try to have others try the same experiment, and report. I have none so affected, or I would try the plan myself.

THE HONEY CROP A FAILURE.

The honey crop has been almost a failure here—only about 150 tons of honey in the county. That much, 150 tons, or 15 carloads, is a good deal of

honey, but we often have in this county 600 tons. Our crop is 32,000 lbs. Honey is selling here in Ventura to-day at 6¼ cts., in 60 lb. tins.

OUT-APIARIES, AND MOVING BEES IN CALIFORNIA.

I have just read C. C. Miller's "Out-APIaries No. XI," with interest. In California we do a great deal of moving bees. In the spring of 1888 I moved two carloads of bees to the Costac (near Newhall). One load was the apiary that I bought of R. Wilkin, on the Sespe—the one that you have shown in the A B C. The other was one of my own that I moved from Ventura. The entire lot was moved without accident, but I do not always get off so well, for I have had many pretty narrow escapes for myself and team.

SUGGESTIONS ON MOVING BEES.

If friend Miller will pardon me, I should like to make a few suggestions. First, always have the bolt or wrench that holds the doubletrees to the tongue loose, so that it can be jerked out instantly. Second, be sure that the neck-yoke is so arranged that it will slip off the tongue without catching, so that, in case of an accident, you can jerk out the bolt with one hand, hold the doubletree with the other, and get the horses away from the wagon right speedily. Third, if you drive four or six horses, as we do here, always have the leaders attached to the tongue with hooks, so that you can unhook the leaders and drive them out of the way without having to stop to unhitch all of the tugs. Fourth, use snaps on the lines, and everywhere possible, especially on the holdback straps on the thills, if you use a one-horse wagon.

Two years ago I was moving an apiary. We used six horses, and had about 85 hives on the front wagon, and about 60 on the trail wagon. One of the hives on the front wagon burst with the weight of so many hives on top of it. They were piled up six high. The hive burst so that nearly all of the bees got out; but we got the six horses unhitched and out of the way without any of them getting stung, and had no assistance but a boy 24 years old. What a scrape we should have had if we had not taken the above-mentioned precautions. Since I have been in California I have moved over 2000 hives of bees, and have had no serious accident. But I used to get into all kinds of scrapes when I first commenced to move bees. When Dr. Miller comes to California to move bees he will have to put the combs lengthwise instead of crosswise of the wagon, to get over our roads without having a general smashup.

L. E. MERCER.

San Buena Ventura, Cal., July 24, 1889.

Thanks for your additional information, friend M. The more I think it over, and compare symptoms, the more I am inclined to the opinion that this California bee-disease is something similar to the nameless bee disease described in the A B C book. The latter is always cured by the removal of the queen, so far as we have ever known; and you say that, in one or two instances already tried, the peculiar disease which has visited you in California yields to a similar treatment. I have written to friend Webster, asking him to send a few of the affected bees to Prof. Cook, who will doubtless give us further information in regard to it; also whether he considers it the same as the ordinary nameless bee-disease. Your suggestions on moving bees are good; and

friend Miller would, no doubt, indorse all of them, even to the last clause, were he in California.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

HOW TO CURE CLOVER-BLOAT WITHOUT MEDICINE OR THE KNIFE.

I read with much interest the article on clover-bloat, by Prof. Cook, in *GLEANINGS* for June 15, page 488, and I was greatly surprised to hear him recommending the use of the knife "in severe cases." Now, I have never failed to cure a case of bloat, without either knife or medicine. I will instance one case. When I arrived I found the animal leaning against the fence (it was a milch cow), bloated apparently to the full extent the skin would hold, moaning pitifully, and wet with sweat, and in ten minutes after my arrival the bloat was gone and the cow was comparatively easy. My remedy is not original with myself, and is pretty generally known in some sections where I have been, and I have been waiting in the hope that some one more capable than myself would reply to the professor's article, and give

THE REMEDY.

Take a billet of wood, $1\frac{1}{2}$ to 2 inches in diameter (round is preferable), and 18 to 20 inches long. Tie a stout cord to each end; force it back into the animal's mouth, and tie the cords to the horns; if it should be without horns, put a strap around the neck to tie to. This prevents the animal from closing the gullet, and the gas will rush out of the mouth with a sound that can be heard for some distance. In severe cases it is well to give half a pint of melted lard after the bloat is gone.

Galion, O., June 22, 1888.

A. W. MUMFORD.

Why, friend M., what you tell us is astonishing, at least to me. I did not know before that such a thing is possible. As I understand it, the cylinder of wood is simply to prop open the jaws. In the absence of a cord or any thing of the sort, could not relief be given by simply grasping the stick in both hands, putting the arm around the horns, and holding it in place until relief comes? So important a remedy should surely be generally understood and widely published. Have others succeeded in a similar way?

CARRYING OUT CAPPED BROOD.

I am writing for a little information concerning my bees. There is something wrong that I can't account for. I got one of your A B C books, but that does not appear to treat the trouble. The bees are carrying out the brood just about the time the larvae are getting their legs and eyes, and they still have life in them. I will inclose one in this letter, to show you the size when carried out, and the brood-comb is apparently all wasting. It is in holes that I can put my fingers through in places. The comb appears to have a natural color for brood-combs. I have two colonies affected in the above way. They are both young swarms—one on the 15th of June, and the other on the 27th. They are from the same colony. Now, if you can give me any advice it will be thankfully received, as I should like to do a little in the bee-business. They

are the common bee. I intend to change them to Italians in the spring, if I can keep them over winter.

L. F. BINGAMAN.

Wilkinsburg, Pa., July 29, 1889.

There is only one thing we can think of, in view of the state of affairs you describe. We once left some combs where the moths could get at them. I think they were taken from the hives and left out a week or more in the month of June. Finally they were taken to the bees; but the moths had laid so many eggs in the combs that the miniature worms went to work in the larvae just as you describe. There was nothing for the bees to do but to tumble them out, even when they were alive and kicking. In fact, they were obliged to dig all through the combs to get the worms out. Some of these moth worms, however, were so small as to be hardly visible to the naked eye. Of course, when the worms were all hatched, the trouble was all over. Italian bees will prove a remedy—that is, if the matter has not righted itself already.

WHY DID THE BEES KILL THEIR QUEEN?

A neighbor of mine got me to divide his bees. Although it was late in the season, I told him it could be done, but he would have to feed them up. The colony was very strong, and good Italians. I looked the combs over once to find their queen, and missed her; then I looked the second time very carefully, and failed again. I thought she might be on the side of the hive, so I got an empty hive to set some of the frames in, so I could see her. I lifted out a few frames and saw a ball of bees on the bottom of the hive. I knew that the queen was in it. I called for a pan of water, which was soon at hand. I dropped them into the water, and they soon let go of the queen, but she was stung to death. The bees were very gentle, and as they were getting plenty of honey from the basswood you know that they were not disposed to rob. Could they just have been in the act of superseding her at that time? There were no queen cells in the hive, but plenty of brood in all stages. The queen was very prolific.

BEES BY THE POUND.

In selling bees by the pound, can you take the bees from one place and get the queen from another place and put her with the bees that are not her own, in the cage together, without the bees killing the strange queen?

NIMSHI NUZUM.

Boothsville, W. Va., July 29, 1889.

It sometimes happens that, when we disturb the brood-nest, the bees will commence balling their queen. They know that something is wrong, and in trying to locate the blame they pitch into the poor queen, and sometimes kill her, as in your case. But as a general thing, if you smoke the ball until dispersed, close the hive up immediately, and leave them alone, you will probably find the queen all right in a day or so afterward. Now, here is the point: Those who introduce their queens think they must look them over every four or five hours, instead of letting the bees release them by the Peet or candy plan. When the bees release the queen quietly, without any disturbance from the apiarist, they are much less inclined to sting her than if the apiarist himself releases her—an operation which

requires the pulling-apart of the hive and a general disturbance of the bees as a result. We try to emphasize to beginners to let the introducing-cage do the work itself. In regard to taking the bees from one hive and the queen from another, and mixing them in the shape of a pound package, we think the queen will be accepted in a majority of cases. Sometimes when we have had an untested queen that we wanted to send out with a pound of bees in a nucleus that could hardly spare the bees, we have made up a pound from three or four different hives, mixing the bees thoroughly together. After that we drop in the queen. We have never yet had a report that the queen in such cages was killed. It is simply carrying out the Doolittle plan. Ordinarily, the bees and queen should be taken from the same hive, as it is better not to take any risk—especially so as every shipper should guarantee safe delivery of a live queen, together with the pound of bees, to his customer.

AN APIARY VISITED BY A CYCLONE AND THEN BY A FLOOD; RECOVERY FROM THE WRECK.

Six weeks ago I almost made up my mind to write and tell you to put mine among the Reports Discouraging. Last January, if you remember, I wrote to you telling you of the cyclone playing havoc with our bees. Well, this time it is the flood. The flood of June 1st destroyed nearly all our bees (60 hives). A number of the hives were completely destroyed, and in the rest there were more than one-half of the bees drowned in each hive. If I had not made a boom of timbers around our beeyard, bees, hives, and all would have gone away. Before the flood, our hives were full of bees, and we were in hopes we should get a good crop of honey; but our hopes are blasted. To date I have taken about *fifteen pounds* of honey, and it will be about all we can get this year. But it is surprising how they have built up since the flood. All the brood, sealed and unsealed, in the hives during the flood, the bees carried out, and now the hives are full of bees again. Within a square of our place, nine houses, two large ice-houses, and two bridges, were carried away, besides a number of barns, etc. At one of the bridges fourteen persons were drowned. Newberry, my postoffice address, is a suburb of Williamsport, and I suppose you have read how Williamsport, has suffered.

FRANK W. LIGHTON.

Newberry, Pa., July 29, 1889.

HOW I GOT RID OF FERTILE WORKERS; FORMING NUCLEI, ETC.

Not having time to go through with any scientific operations to get rid of fertile workers, I continued to give them brood from other colonies as fast as I thought they could take care of it. After awhile the fertile worker ceased laying; they raised a queen from the brood given them, and she is now tending to business with "neatness and dispatch."

HOW BEES SPREAD THE NEWS IN A HIVE.

I took a frame of brood with the bees adhering, and put them in a hive by themselves. I put an empty frame beside the one with the brood, and then a division-board. Then I brought another frame and shook the bees into the new hive, and returned the frame. I fastened a queen-cell on to the frame that had brood. I knew the young queen was about ready to emerge, because when I put

the small end of the cell up to my ear I could hear her at work inside. Well, in an hour or two I went to see how they were getting along, and found them contented and happy. Quite a number of them were around the entrance, going through all the operations usually found when bees have established themselves and are contented.

While I was watching, a bee came out in a tremendous state of excitement. It rushed pellmell against the first bee it came to, then whack head-first against another, over the top of the next, until it had visited every bee around the entrance. In fact, its whole anatomy seemed to vibrate with excitement. This took place late in the afternoon, toward evening; and next morning I found the young queen on the comb. Now, Mr. Root, do you suppose that that bee was on hand when the young queen made her appearance and was carrying the good news to the rest of the bees? I wonder if she heralded the advent of that queen throughout the length and breadth of the new settlement; and I wonder if there will be as great rejoicings when she returns (if she does) from a successful wedding-trip.

ARCH. DUNCAN.

Wyoming, Ont., Can., July 27, 1889.

Giving plenty of brood in all stages of development to any colony having a fertile worker will sooner or later cure it. In fact, fertile workers are only the result of keeping the hive too long without queen or brood. I have never noticed the kind of behavior of the bees you describe, when a queen is hatched; in fact, I have never seen them make any demonstration of the kind unless it was when a laying queen was given them, or a comb of brood. Bees that are hopelessly queenless, and have been so for some time, will usually manifest their joy when either queen or brood is given them, and they manifest it in much the way you describe. The hatching of a young queen might, under some circumstances, produce such an effect. But, as I have said, I have never been able to see that the colony took much if any notice of such an event.

HIVE-LEGS IN BOWLS OF WATER; PALMETTO HONEY.

Every thing we ordered came, and there was no damage of any kind. I guess you wondered what we wanted with so many bowls. I have my hives on stands, each having four legs. The bowls are placed so that each "leg" stands in a bowl. The bowls are kept full of water. In some I put a little salt. The bees get water and salt as they need it, while the large ants can not get at the bees. I believe in shade, and have my six colonies under palmetto-trees, which are just commencing to bloom. The bees get a nice honey from it, something like white-clover honey, if I remember aright. I may send you a sample if I find a piece of comb of small enough size. When I send samples I like to send comb honey.

ORANGE-TREES.

I do not think orange-trees give honey every year alike. While the conditions were so that at Orlando a drop of honey could be seen in the blossom, I looked ever so often at them here, and at first imagined the bees were getting pollen; but by observing them closely I found they went home loaded with honey. Each bee visited quite a number of blossoms, and the trees "hummed" with the

busy workers. I also noticed some trees loaded with bloom which the bees scarcely looked at. The scrub-palmetto was a failure here this season. Just now bees are "at home," and cross.

MISS CLARA SLOUGH.

Daytona, Fla., July 22, 1889.

We did wonder a little what was to be done with the bowls, my friend, but it is all very plain now. Perhaps our three-cent bowls are the cheapest thing that can be furnished for this purpose. One objection has come up against their use in this way, and especially where they are used in hot climates — the rapid evaporation of the water; but to prevent this, the surface of the water has been covered with a layer of oil.

THE IGNOTUM AS EARLY AS THE DWARF CHAMPION.

Yesterday, Aug. 6, I picked my first Ignotum tomato, but at the same time picked one from both a Mikado and a Dwarf Champion, so that with me they are not proving any earlier than the others. It is a smooth tomato, weighing a little over a quarter of a pound, but I have others which will be much larger.

K. A. CLARKE.

Groton, Ct., Aug. 7, 1889.

Why, friend C., nobody ever claimed that the Ignotum is an early tomato, so far as I know. It was not intended for such; but notwithstanding, I did mention that the first tomato I had ripen in the open air was the Ignotum last season. Now another season has proved that it is as early as the Dwarf Champion, for which so much has been claimed. Our experience is like yours. Our first-ripe tomatoes were picked about the same day, from the three you mention, also from two others which I shall speak of in another column.

ANOTHER REASON WHY ONE SHOULD JOIN THE CHURCH.

Will you allow me to add one more thought to your four good reasons why one should join the church? It is a reason which would come with convincing force to every reader. It is found in Matt. 12: 30: "He that is not for me is against me; and he that *gathereth not with me, scattereth abroad.*" What will that sound like to the large mass of church goers—that the blessed Jesus himself explicitly declared that he considers every one who is not positively working under his standard as really working for the evil one? Just as in a harvest-field, one cuts the grain, another binds the sheaves, and a third gathers them into the barn, while the fourth, though he may be *in the field*, and even looking on with complacency, yet, if he is not *actually assisting* in the harvest, will not be entitled to the reward.

Mons, Va., July 26, 1889. A. H. VAN DOREN.

A GOOD SUGGESTION ON HOW TO BURN SULPHUR.

I put one or two pounds of lump or stick sulphur into an old cast-iron dish; set it outdoors on three stones, over a slow fire, to melt. While I am watching it I tear old calico into strips, a couple of inches wide and as many feet long; put some of these into the melted sulphur; and when they are saturated I take hold with pincers on one at a time, and raise it straight up to let it drain off. After a few seconds, when it is dry I throw it aside, going on in this way till the dish is wiped dry. For use, take one or two strips, according to your tight box or

closet; put into an old pan; fix a raised cover of another one to protect your goods close by; apply a match, and you will be surprised to see what a great smudge you can make with a minimum of sulphur and heat.

WM. GOLDSPOHN.

Lodi, Wis., July 29, 1889.

Your description reminds me of the way in which I used to see them fix their sulphur matches for brimstoning bees in my boyhood. I believe they did it exactly as you describe. But in this case is there no loss of sulphur from sublimation? or does it all get converted into sulphurous acid by burning?

HIVE BARROW—ANOTHER DEVICE OF H. FITZ HART.

Mr. Root:—In reply to your favor of July 2 I had forgotten to send you a drawing of my modified hive-cart. After sending you my idea that your artist so ably worked out in GLEANINGS of May 15, I chanced to see an old wheelbarrow, something of the pattern of your Daisy. I knocked out the bottom, put on two more legs, as shown, nailed a horizontal piece $2\frac{1}{2}$ inches from the ground, on the legs, in such a way that it would be level when the

barrow was being wheeled. To use it, I run it up to the hive I want to move, and drop it over; then I put a stick on the side-pieces, at each end of the hive, under the bottom-board. For use when taking out frames for extracting, I put a board on the two side pieces, and then pile my hives of full or empty frames on that. If made with two wheels instead of one I think it would be one of the most valuable articles about the bee-yard, especially where one is working 150 hives single handed, or has to move them in and out of the cellar.

Avery, La., July 6, 1889.

H. FITZ HART.

Very good, friend Hart; but we do not quite see what will hold the handle-bars of the barrow rigid. Is there not a liability of their wobbling sidewise, as you have represented it? On a good many accounts we think your hive cart illustrated on page 410 is better.

REVERSING OF HIVES AND SECTIONS; A CALIFORNIA APIARIST CONSIDERS IT.

I am greatly interested just now in some kind of a reversible frame or hive, or both. I have had a great deal of trouble this season to get the bees to go into the T supers to work in the sections. They would fill the lower part of the hive nearly to the bottom-bars with honey, and then laugh at me when I would look into the super to find it entirely empty. I fastened the frames in two hives so that I could reverse the whole hive. One of the colonies thus reversed took immediate possession of the super, and filled the 28 sections in about one week. The other did not go above after being reversed until I put on a super that was partly filled; then it went to work in earnest. I think that, if I could have reversed about 100 hives at the same time, I should have now several hundred dollars' worth of

comb honey. R. Wilkin has one of the Shuck reversible hives, which I have been examining. I think I should like it as a brood-chamber, to be used with the T super. Where can I get a few of the castings for the Hetherington reversible frame, shown on page 514? I wish to get as many reversible hives as I can this winter, and then select from them the one that I consider the most practicable for comb honey. I think it will be a long while before we get a more convenient hive for extracting from than a common L. hive. L. E. MERCER.

San Buena Ventura, Cal.

I am exceedingly glad to see you give the above testimony in regard to the benefits of reversing. The same thing came up a year or two ago. But so many of our good bee-men have abandoned the reversing business entirely we were almost inclined to think it was a mistake. Very likely many of them never tried it. You ask why we do not try it here. Well, the truth is we seldom have our hives so crammed and loaded with honey as they do in places where there is a greater honey-yield, or where there are not so many colonies kept in a place. I think, friend M., if I were you I would experiment a little more before going largely into reversible hives. Our friend E. H. Cook, of the *Bee-hive*, says he always regarded the reversing craze as a "harmless lunacy." Will he try it a few times and see what he thinks of it? Perhaps he has; if so, we will take it all back.

A DEAF AND DUMB BEE-KEEPER.

I have been keeping 7 swarms of bees. I am deaf and dumb. I learned to handle bees about 3 years ago. I can tell signs of bees swarming out of the hives. I can't hear any humming, but my eyes see. I watch them every morning. I study your A B C of Bee Culture. I should like to keep a good many swarms of bees. Last week I took 35 sections of white honey. I expect to take about 75 more this week. EDSON HULETT.

Pawlet, Vt., July 22, 1889.

We are glad to hear from you, friend H. We have at different times had quite a few bee-men on our list who were deaf and dumb; and, strange to tell, they are almost always good bee-keepers. What they lack in hearing, they somehow contrive to make up by sharp seeing.

SWARMING OUT, AND FORMING THREE CLUSTERS.

Quite a large swarm came off from my Heddon hive (I have only one of them) three weeks ago last Sunday morning, and settled in three separate clusters on a small peach-tree. I hived them all, in one hive, a one-story chaff, and they went right to work and have been doing well. How do you explain three separate clusters from one swarm?

Indiana, Pa., July 23, 1889. W. B. MARSHALL.

Very likely there were three queens, one in each cluster, and two of them, no doubt, were virgins, which went out with the swarm. The circumstance is nothing unusual.

REMINGTON'S PHARMACY; MORE GLUCOSE NONSENSE.

On pages 675 and 676 of Remington's Pharmacy the following is found. I give it verbatim, and you can draw your own conclusion, and remark there-

from: "It is not known whether honey is secreted by the bee or whether it exists ready formed in plants. The nectaries of flowers contain a sweet substance which is extracted by the insect. Large quantities of honey are obtained from California, the Southern States, and the West Indies. A still larger amount, however, is manufactured by flavoring and coloring artificial glucose." * * * "Owing to the difficulty of obtaining pure honey in large cities and towns, its place in many official preparations has been filled by substituting syrup or glycerine." GEO. F. WILLIAMS.

New Philadelphia, O., July 22, 1889.

That is the kind, friend W. Pitch into the cyclopedias and pharmacies, and dig up all their false statements. And now let us all go for the publishers. Can you not give us the address of the publishers, and the date when it was put out? The closing sentence is pretty cool indeed. Will the pharmacy please tell us the name of the city or town where pure honey is not to be had every day in the year, and in any quantity? If our cyclopedias and such like books of reference are going so much on the Rip Van Winkle style, they will soon find that our progressive American people will leave them high and dry on dusty shelves, unused and uncared for.

REPORTS ENCOURAGING.

Plenty of honey; from 14 to 31 colonies, and 800 lbs. of honey; best ever known here.

Thornville, O., July 26, 1889. GEO. BEAGLE

I started with 19 colonies and now have 43. Have taken off 600 lbs. of section honey.

Little Rock, Ill., Aug. 5, 1889. JESSE BRADY.

I have 12 colonies of bees. They are doing finely. Honey is only 8 and 10 cts. a pound for the best clover.

NEWTON NIXON.

Olds, Iowa, Aug. 6, 1889.

We had 43 colonies in the spring, which have increased to 70. Though the season has been very dry, we have extracted a little over 3600 lbs of honey, chiefly clover and basswood.

FANNY POND.

Bloomington, Minn., July 30, 1889.

NO LOSS FOR THE LAST FOUR WINTERS, AND HONEY COMING IN AT THE RATE OF 5 LBS. PER DAY, ON THE SCALE HIVE.

You will have to put me in Reports Encouraging. I have wintered in the cellar four winters without the loss of any bees. I had 17 colonies, spring count, for 1889, and have had 15 new swarms. I use the Heddon method of hiving on the old stand, and do not have any after-swarms. My hives were full of honey when set out of the cellar, and have continued so up to basswood bloom. They put in a large amount of honey from the basswood, which closed a few days ago; but the honey-flow still continues from other flowers. My scale hive indicates about 5 lbs. per day, of fine white honey. The honey-flow will continue here until frost comes. One swarm came out, and it left without clustering. I followed them to a hollow tree, about half a mile. I have Italians and hybrids. The Italians are the best honey-gatherers with me.

J. ROUSE,

Camden, Minn., July 27, 1889.

THE GREATEST HONEY-FLOW EVER KNOWN.

There has been the greatest honey-flow this year I have ever seen since I have had bees. I divided mine early, and both parts got strong, and swarmed. I started with 60 colonies, and increased to 130, and have taken over 4000 lbs. of honey—one-third comb, the rest extracted. The clover is still fair, with a good prospect of a full crop.

GEORGE BRIGGS.

New Sharon, Iowa, July 28, 1889.

ENCOURAGING FOR COLORADO.

This is the finest season for crops ever known in Colorado, and promises to be fine for honey. There are great fields of alfalfa, and it is being raised more and more, and very fine honey is made from it. Colorado promises to be a great honey State. Henry Knight, an extensive bee-keeper ten miles from Denver, sold six tons of honey last season.

Denver, Col., July 24, 1889.

J. L. PEABODY.

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 139—*a. Do you let the bees supersede the queen naturally? b. Or do you think it pays to supersede, as a rule, yourself, say in one or two years?*

a. No; b. Yes.

A. E. MANUM.

a. Generally; b. Yes, if she shows signs of failure.

S. I. FREEBORN.

a. Generally I do. b. That's an unsettled question with me.

C. C. MILLER.

a. Not as a rule. b. It pays, because you can select your breeding stock.

RAMBLER.

a. Yes, unless I have a poor one. Then I do the superseding.

A. B. MASON.

a. Yes, unless the queen has ceased to be prolific. b. I don't think that superseding queens pays, as a rule.

C. F. MUTH.

I always let the bees do the superseding, as they know best when to do it.

PAUL L. VIALLO.

a. Very often we do. b. But it pays well to supersede, in all cases, yourself.

P. H. ELWOOD.

a. Yes. b. As a rule, I think it pays better to let the bees do their own superseding. They can do it cheaper, and with fewer mistakes, than I could.

J. A. GREEN.

a. I have usually left this to the bees; b. I shall look after it more in future. I believe it will pay to do so, if we can manage it so as to lose little or no time.

A. J. COOK.

a. No, not as a rule. b. Yes, I think it pays for us to take this business into our own hands. For a fuller answer to this question see article in GLEANINGS for 1888, page 525.

O. O. POPPLETON.

a. Yes, if they do so in time; b. When the queen begins to play out, and the bees do not supersede her, I kill her, and either supply the colony with another or let the bees raise one.

GEO. GRIMM.

In conducting large apiaries I think it pays best to leave this matter pretty much with the bees.

H. R. BOARDMAN.

Let the bees do it, as a rule, unless you notice that a queen is failing, when it is a good plan to replace her.

DADANT & SON.

a. As a rule, I do; but many times, when I find a queen is faulty in some respect, I supersede her; b. I should not supersede a queen that was a good layer and her progeny docile and good workers, even if she were three years old.

MRS. L. HARRISON.

a. Generally; b. Not unless I wish to change the strain of bees which certain colonies have. There are very few colonies indeed in my apiary which I could benefit by taking this matter into my own hands, as the bees know their wants along this line much better than I do.

G. M. DOOLITTLE.

My practice is to let the bees attend to that matter. I think they know rather better than I do when a queen needs superseding. Yet the practice of superseding, at two years old, all queens not known to be specially excellent, seems to commend itself as a sensible plan.

E. E. HASTY.

a. Yes, in many instances. b. Were I running an apiary exclusively for queen-rearing, I think I should do the superseding myself; but in running for surplus honey I should let the bees do it, except in a few instances here and there, when I happened to blunder on to the necessity, and had every thing in readiness to supersede with.

JAMES HEDDON.

a. Sometimes we find that a queen is not doing good work, then we kill her and give brood from some other good colony, and let them raise a queen. But as long as a queen is doing good work we don't destroy her. b. I think it pays to supersede a queen when she doesn't do good work, regardless of her age; but I would not supersede a good prolific queen on account of age. Let her remain as long as she does good work.

E. FRANCE.

a. Ordinarily I let the bees supersede the queens themselves; but if their merits are in any way doubtful, I kill them. I started cropping, intending to kill all two-year-olds; but I am thinking they will not give me a chance. In March, 1888, I cropped the left large wing of 283 old and young queens; in March of this season, only 80 of those queens were left, and I think that more than half of them are gone now. I am inclined to think that bees are more reckless of queens in California than in the States east. b. It will take a little more experience to decide about the paying.

R. WILKIN.

I am inclined to think there would be more superseding than there is if it were not so much bother, especially where there are large apiaries and out-apiaries besides. A great many start out with the determination to supersede every queen that is not first-class, as soon as she is discovered; and after awhile it becomes too much of a task to keep track of them, and, like Hasty's book, is abandoned. Most bee-keepers I visited, however, promptly replace poor queens when they come across them; and in several places, by asking questions I found they were in the habit of superseding queens where the bees were very cross, even though they produced good crops of honey.

QUESTION 140.—*a. What is the longest time you have known a queen to give good service? b. How long will queens usually give good service in the hive?*

- a. Five years; b. Two years. A. J. COOK.
 a. Three years; b. Two years. S. I. FREEBORN.
 a. Four years; b. Three. DADANT & SON.
 a. Three years; b. I think two years, on an average. E. FRANCE.
 a. Between four and five years; b. Three and one-half years. JAMES HEDDON.
 a. I have had some for four years. b. Usually two years. PAUL L. VIALLO.
 a. Four years. b. Not over three years, and very often not over two. J. A. GREEN.
 a. I hardly know; but I think not to exceed 3½ years; b. Three years. GEO. GRIMM.
 a. Almost four years. b. They are often as profitable as the best, in their third year. C. F. MUTH.
 a. If no mistake has been made in my entries, five years. b. Perhaps two to three years. C. C. MILLER.
 a. Five years; b. Two years. Usually, a queen hatched in June or July will be in her prime the next season. A. E. MANUM.
 a. Four years. b. Queens carefully bred, three years; but as a rule, I try to have queens not much over two years old. RAMBLER.
 a. Four seasons. b. For two full honey seasons. I am inclined to think, that here in Cuba not more than one full season. O. O. POPPLETON.
 a. Five years. b. Good queens, two years; the best, three years, if not crowded too hard, and two much hardship in wintering. P. H. ELWOOD.
 a. Four years; b. For two years; some, perhaps a half, for three years. I think that most begin to fail "a leetle" the third year.

MRS. L. HARRISON.

I doubt if the average queen can be made profitable more than three years; and I think the most useful period of their lives is spent in two years.

H. R. BOARDMAN.

a. Five years. b. With me, two years usually, although one of the best colonies I now have has a queen three years old, and is now better than ever before. A. B. MASON.

a. Five years; b. The average life of my queens is not far from three years. If they do not do good work, the bees find it out and supersede them, this being done with some in the second year, and not till the fifth year with others. G. M. DOOLITTLE.

a. Years ago, while living in Cadiz, O., I got a queen from Italy. I do not know how old she was when I got her. I kept her three years, and sold her, with the colony she was in, for \$15.00. The purchaser, the next season, had her stolen from his hive, so we lost the run of her. While I owned her she had one wing off, one leg off, and the foot off another leg, yet hobbled around and laid as many eggs as any queen I had. b. I should be inclined to consider queens good for three years, in the East, and for two years here. They get to rest more in the East. R. WILKIN.

As I neither clip wings nor raise queens for sale, nor run many colonies for extracted honey, my facilities for knowing the age of my queens are much less than usual. The long period that sections are on, where surplus comes in in September, as well as

in previous months, is a serious bar to knowing when queens are superseded. When I began bee-keeping I got a blank-book and entitled it "Queen Ledger," and was going to have the life history of every important queen all down in black and white. But somehow or other the thing didn't run well, and not a record in the book would be of any value if published. E. E. HASTY.

I am surprised to find that so many report having had queens that would do good service for four or five years. In regard to superseding queens, I once had a queen that I thought did not lay up to the standard, so I took her out of the hive and gave her to a friend who happened to be there. She was a fine Italian, and her bees were beautiful, and good workers. But the colony had been weak so long that I decided it was her fault. My friend, however, put her in a strong colony, and afterward decided that she was one of the best queens he had, even though she was in her second year. This incident has led me to be more careful in deciding too hastily that a queen ought to be superseded.

THE OLD GERMAN BROWN BEE.

BY W. P. HENDERSON.

How sweet to our taste was the honey of childhood,
 When corn was in tassel and robbing time came!
 The honey from linden, from poplar, and red-bud,
 From clover and vervain, was sweet "all the same."
 The long line of gums, and the bark shelter o'er them,
 The big roll of rags, and the buckets hard by—
 The neighborhood old folks, with cob pipe and long stem,
 And e'en the old black bee which stung near the eye.
 The wicked old black bee, the old native brown bee,
 That stinging old black bee that closed up the eye.
 Such nectar! such sweetness! oh, who but a laddie
 Could relish such chunks as they passed to and fro?
 For bee-bread and larvie were mixed just as cut from
 The top of the gum to the cross sticks below.
 The mead and metheglin, and cherry-tart pies!
 Oh! who in his raising e'er wished or asked more?
 Come back, ye old times, and enliven our dotage,
 And give us the bee and the honey of yore—
 The thick linden honey—the honey-dew honey,
 The rich candied honey and stinging brown bee.

How fondly we cling to and cherish the mem'ry
 Of hollow elm gums and the comb they contained!
 Of piggins and pails full, stored by in the pantry,
 And boiler with wax through the old meal-sack strained.
 Alas, what a change! now with sections and sling-
 ing,
 And fancy-marked bees from beyond the broad sea!
 No swarming, no tin pans to gladden life's evening,
 We sigh for the ugly old German brown bee.
 The old stinging workers—the brown colored workers,
 The dark-colored, homely, old spiteful brown bee.

Murfreesboro, Tenn.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: Sheer Off, Silver Keys, The Giant-Killer; or, The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room. We have also Our Homes, Part I., and Our Homes, Part II. Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

HOW ALBERT MADE A NUCLEUS.

I had one stand of bees myself. When papa was extracting honey he would cut off the queen-cells and throw them away. I picked them up. I gathered young bees off the ground, and put them in a box, and the queen hatched out and became fertile. Papa extracted 120 lbs. of honey from my bees last year. ALBERT DEGLANDON, age 9.

McDade, Tex.

BIRDS AND DUCKS.

I do not know much about bees, so I will write about birds and ducks. There are many different kinds of birds. A little speckled bird has a nest in a small tree in our yard. There are four little birds in the nest. The old bird is very tame, and comes close to the door and eats the crumbs we throw out. We often throw crumbs out for them. Several years ago we had some ducks and a fish-pond. In the summer the water got low, and the ducks worried the fish to death. We sold the ducks and have raised none since. IDA HOWER, age 12.

Macy, Ind., July 7, 1889.

WHAT A LITTLE GIRL THINKS OF THE SERMON OF JULY 15.

I think the sermon of July 15 is good. I think that Christians ought to join the church as soon as they are converted. I joined the church when I was 11 years old, and I never have regretted it and never shall. I intend to live for Christ as long as I live. A protracted meeting begins at Dyer to-night, and I hope we shall have a revival of religion at this place. The county Sunday-school convention will be held at Dyer this month. I am very much interested in Sunday-schools, and I wish to attend and learn something if I can.

Dyer, Ark.

ROSA MANUEL, age 14.

BEE-KEEPING IN FILLMORE CO., MINN.

Six years ago my father got two colonies of bees, and now we have 115. Mr. Shaw, one of our neighbors, had a colony of bees that swarmed three times in three days. Did you ever hear of such a thing? People say they never saw so much white clove as there is this year. There is a large number of runaway bees this year. One of our neighbors had a swarm of bees go into his barn, and another swarm went down the chimney of his house, Do

you think bees are deaf? Most people think bees can hear, but father says they can not. My brother found a swarm of bees at one of the neighbors'. He helped put it in a box, for they had no hive, and the last we heard from them they were doing nicely.

PETER H. SEVEY, age 12.

Preston, Minn., July 22, 1889.

Yes, friend Peter, bees will swarm three times in three successive days; and if the queen's wings are defective this is nothing unusual. Tell your papa that those competent to know think bees can hear. We all have good evidences of it.

THROWING WATER AT SWARMS.

When our bees swarm we throw water at them, and they settle. We put salt water in the hive, and they go in.

HATTIE FORREY.

Harrison, Kan., Mar. 30, 1889.

Water is a good thing to bring down swarms, but salt water, we feel sure, has little to do with making the swarm accept the hive.

PAPA'S BEES; THE NICE WHITE SECTIONS, ETC.

Papa has about 50 stands. We have had about 9 swarms this summer, and could have had more if we had wanted them; but papa cuts out the queen-cells, and that stops the swarming. He uses the Simplicity hive, and he thinks it is the best. He also uses the yucca brush when extracting. I like the little white sections you send us, when they come out of the hive, full of nice white honey.

Papa has taken the premium at the fair, and everywhere he has exhibited. He took out about 4000 lbs. of nice honey last season. He has the A B C book, and I like to read it very much.

Reno, Nevada.

FLOSSIE MOORE, age 10.

PAPA'S BEE-CELLAR.

Pa moved all his bees, about sixty hives, two miles, a year ago last December, and put them in a new cellar under our new house, which looked nice and clean, with a cement floor. During the winter the cellar got awful damp and cold, nearly freezing. We did not move to the new house until March. About two-thirds of the hives were dead by the middle of May. We had no honey last year. Pa fed the bees on white sugar syrup last fall. We have a furnace in the cellar where the bees are this winter. Pa has a thermometer hanging on one hive, which stands about 47° or 48°.

FLORENCE M. HARTMAN, age 10.

Woodbridge, Ont., Can.

BEES IN GERMANY.

The last report I have had from Germany, bees are doing well. They are gathering heather honey at present. Heather honey is about the best, and it blooms for a long time. This honey is sold in the comb, as it can not be extracted. The hives papa sent out with mamma are now filled with bees. Bee-keepers from all around have been looking at our hives, etc., in our German apiary.

To-day papa bought a large swarm. It cost about \$2.00; but he gave a smoker and an A B C book for it. Do you think it is worth it? Our bees are filling up boxes very fast. We had a lot of weak stocks which we united, and papa thinks that honey will bring a large price next fall. In GLEANINGS of July 15 I noticed that the price of extracted honey was 7 cts. per pound. We sell all our honey at

25 cts. per pound in New York, and have no trouble in getting this price. ANNA BLANKEN, age 12.
Jersey City, N. J., Aug. 1, 1889.

A TALK TO THE CHILDREN.

A LITTLE WOOLLY-HEADED BEE-KEEPER AWAY
DOWN IN LOUISIANA.

I HAVE been thinking a good deal about the juveniles of late. The way it came about was this: I took out the head of a barrel that A. I. Root had sent us, containing honey, cases, etc. It was the pretty nails, that I drew out with the hammer, that pleased me so much. How smooth and bright, and how nice they felt to my fingers—so different from the rough ones I have been accustomed to handle! I hope that you will enjoy wire nails as much as I do. These nails made me think of what an old man once said to me: "My old days are my best days. When I was young, and we lost the fire, what a time we had to kindle it with flint and tinder-box! and now we can so easily strike a match!" I remember one of my cousins telling me that their fire went out, and they lived in a new country, far from neighbors, and that her "daddy" had to fire a gun into some shavings to kindle it. What I was thinking about, children, was this: That you are going to live in a yet better age than we are now living in. I thought about it as I sat in my rocking-chair and whacked together the pretty one-piece sections. How different our honey is from what I used to eat, taken from log gums, after the poor bees were smothered with burning sulphur! It tasted mighty good, though; and, didn't we have a licking good time for awhile, although the comb was black, and honey mixed with bee-bread?

We enjoyed ourselves just as much as you do now, and I sometimes think more, in going to school in log houses, carrying our dinners, and building playhouses at noon, visiting one another, and treating with sumac berries passed around on broken dishes. How delicious they were after frost! I was a child on the frontier, and there were no apples but crabs; wild strawberries had a better flavor than any tame ones I have ever tasted, and plenty of blackberries and plums.

By the way, I had a letter lately, from a lady away down in Louisiana. I got acquainted with her at New Orleans when I was at the bee convention, during the Exposition. Here is an extract: "I am a raiser of orphan children. I have raised five—three are with me now—one white and two negroes—all bound to me, as that is the terms of our taking them, in this State. I have had but one girl in the lot, and she is with me now. I have two boys of my own, and one white orphan boy. They are smart, industrious boys; but the little negro boy is a treasure. He is twin with the girl I have, but smaller and frail. They are both as black as coal. The boy is my right hand in the bee-yard. He is neatness itself, and keeps my things all in order. The white boy and he do the marketing together. They are each about ten years old."

Children, how many of us have as good a reputation as this little African? Wouldn't you like to see him in the apiary, with his woolly head? I should. I wish Mr. Root would get his picture, and put it in GLEANINGS, and the apiary with its beauti-

ful Southern flowers, pomegranates, and figs. Don't you?
Peoria, Ill.

MRS. L. HARRISON.

Thanks, Mrs. Harrison. We have enjoyed your talk very much. It would afford us great pleasure to make an engraving of the little woolly-headed bee-keeper, and the apiary with its beautiful Southern flowers, pomegranates, etc. Just tell your lady friend in Louisiana to procure a photograph, at our expense, and have the same forwarded direct to us. We should be glad if she would also give us a short item to accompany the engraving.

OUR HOMES.

And Jonathan caused David to swear again, because he loved him: for he loved him as he loved his own soul.—I. SAM. 20: 17.

ONCE in a while we see friendships among men, somewhat like the friendship of David and Jonathan, as expressed in our text. At least, a few times in our lives we meet with those in whom we have such perfect confidence that nothing can shake it. There is a class of people who seem fond of telling that even such friends have been proved false; but I do not believe it. Whenever you meet a man who seems always rehearsing the frailties and wickednesses of his brother-men, be a little slow in giving him your confidence. The one who sees evil in his fellow-men, very likely judges others by himself. In my business relations I have found a good many in whom I have such perfect confidence that I should have no hesitation whatever in giving them my pocket-book, telling them to use what they like, and I should never care to count the money afterward to see what they took. Their word would be just as satisfactory, or more so, than an inspection of the pocket-book. While it is true, that we ought to be careful about putting so much confidence in anybody, and while we do best, perhaps, to wait till years have tested and tried our friends, I think we ought not to be backward in recognizing and accepting the good that is in our fellow-men, when we find it. So much for a preface to my little story.

After I had visited the bee-keepers of Boscobel, Wisconsin (as I will tell you about elsewhere), I was on board the train again for Richland Center, the principal point of my visit. Part of the trip was to be made on a caboose car attached to a freight train, and it got along rather slowly. In my pocket was a letter from a friend at Orion, Wis. In mapping out my trip, however, I decided—or, rather, Ernest and John decided for me—that I could not very well make Orion without considerable delay. Below is the letter I have been speaking of:

Brother Root, Dear Sir:—Here I come, with an invitation to you to come and see us at the Riverside Bee-farm when you make your visit to friend Freeborn and our great basswood belt. Come, brother Root; come, if you can. I will lend you my Bible while you are here, to read. I will sit down and hear you read and explain; in fact, all you have to

do is to ask and you shall receive all within my power. I will meet you at Muscoda; bring you home to breakfast, dinner, supper, or even your noonday sleep; show you the beautiful valley of the Wisconsin River for miles and miles, by taking a small walk up on the bluff. I would make you as happy as I could while you are here. I would take you back to the station, bid you good-by; and then if my dear wife were alive and could have enjoyed your visit I should have been the happiest man living, having seen A. I. Root, of Medina, Ohio. My prayer is, and shall be, that it is the Lord's will that I may see you.

F. L. SNYDER.

Orion, Wis., June 15, 1889.

You may be sure I read the above letter several times, and it was with much regret that I made up my mind to forego such a kind invitation. For one thing, I felt curious to know why an entire stranger should so greatly desire to see me. I felt a little surprised, too, at the devout tone of the letter, expressed as it is in humble phrases. I decided I had never met *exactly* such a man as the writer. Well, while I was on that freight train waiting for them to unload and load at each station, I happened to listen to the conversation of a couple of men sitting on a pile of lumber near the track. One of them happened to speak the word "Orion." I at once stepped from the car, and, approaching him, said:

"Will you excuse me, sir? but you just now mentioned the name of the town of Orion. Will you please tell me how far distant it is from this point?"

"Why, it is only the matter of a mile and a half or so, just over the river;" and he pointed over his shoulder with his thumb, and went on with his talk.

Only a mile and a half from the man who wrote that kind letter! It was already near sundown, and I had bought my ticket to Richland Center; but as I looked along the sidewalk in the direction he pointed, the temptation to exchange the dusty freight car for a walk on foot was too strong to be resisted. Perhaps I am a little dull, but I did not remember at the time that the name of the town where we were stopping was Muscoda, the very place that friend Snyder mentions in his letter. Never mind the name of the town. I was within a mile and a half of the good friend who wrote that letter, and that was enough.

"All aboard!" shouted the conductor; but as I did not respond to his call, he spoke again.

"Here, you man, get on board quick."

I replied that I had decided to stop where I was.

"But you have paid your fare to Richland Center. If you want to go there, get on quick, for we haven't any time to lose."

I thanked him, but started off along that sidewalk that seemed so enticing, with its pretty shade-trees illumined by the rays of the declining sun. Before leaving home, my wife gave, as one plea to be permitted to stay, that I would always be pushing off into the country, or going off crosslots on foot; and then a woman—even such a one as her dear self (she did not say just that in 80 many words, but she knows very well

that no companion on earth is so pleasant to me as her own *dear self*) would only be a hindrance. Well, this was just one of those places where I enjoyed the liberty of going where I pleased and doing just as I pleased. There were livery stables, doubtless, in Muscoda, but I would not have exchanged the prospect of the walk in the evening, along that street, for the best livery rig that could have been furnished just then. Before I had gone many rods, however, it occurred to me that, if my good wife were present, she would have spoken something as follows:

"Now, look here, dear husband, you certainly should go to the hotel and get your supper before you go into that household and surprise them, and possibly upset them, by coming unexpectedly. Your good friend spoke of his *motherless* home. You can forego the livery if you choose, but get your supper first, so as not to make trouble."

I took my wife's advice—I mean the advice she would have given if she had been present. And by the way, friends, I have got much into the habit of late years of asking myself what my *wife* would do or advise under certain circumstances. So, very likely a great part of the credit you have given *me* at different times justly belongs to *her*. I had a very nice supper; and I enjoyed it the more because a nice pleasant gentleman sat at the table with me. Now, a good many people go through the world, especially while traveling, without talking. You can do as you please, of course; but I think we ought to get acquainted. Perhaps you have heard me say something of the kind before. Of course, I asked my companion at the table about the town of Orion, and whether he knew Mr. F. L. Snyder. After a little explanation he said he knew him. Then we talked about bees and other things. Several times I felt a little surprised that my companion seemed to get the hang of things as he did; and at the close of the meal he put out his hand and said something like this:

"Mr. Root, I am exceedingly glad to have had the pleasure of even twenty minutes' chat with the author of the A B C of Bee Culture."

He smiled a little as I replied:

"Why, my good sir, I have not even told you my name; and as you are not a bee-keeper yourself, what should you know of the A B C book?"

"Well, it is true I am not a bee-keeper, and never have been; but notwithstanding, I have read the A B C book, and enjoyed it. I wish you much pleasure in your visit among the bee-men of our State of Wisconsin."

It was now so late that I walked off hurriedly. The town of Boscobel seems to have been drawn out toward the river. We found pleasant residences and churches, and other fine buildings, for almost a mile; then we came to a toll-gate and a great long bridge. It was not a railroad bridge, but just a bridge for pedestrians and vehicles. And now burst on my gaze for the first time the Wisconsin River. Just as the sun

was disappearing I reached the further shore, and a little further on I reached the town of Orion, resting on the banks of the Wisconsin. The banks were grassy, clear to the water's edge. The waters were pure, and as clear as crystal, while many beautiful islands dotted the stream here and there. Now, I want to say, that, although I have seen many beautiful rivers in my travels, north, south, east, and west, I have never met any sight so entrancing as the Wisconsin River as it appears from the town of Orion. Seeing a group of men near the postoffice I approached them. As I came up I gathered that their conversation was about buckwheat. I smilingly broke in upon them, and asked if it were not likely there was a *bee-keeper* among the number, judging from their topic. Almost the first person I addressed proved to be Mr. Snyder. As he introduced me to the doctor I spoke to the little crowd something as follows:

"My friends, has it often occurred to you that you ought to thank God for the surpassing beauty that is spread out here before us around your home?"

The doctor replied:

"Mr. Root, the man who has lived to the age that most of us have here, and who has neglected or forgotten to do so, would be long and base indeed."

I love that village doctor, and always shall. A few more steps, and friend Snyder showed me his home. It is right on the banks of the river, directly opposite one of the most beautiful islands. The pasture lot for the cow is right on the hillside, sloping toward the river. Said hillside is so steep that I suggested to friend Snyder that I should be afraid the children in their plays might roll down into the river. But he said they never did.

After my walk I felt a little thirsty. I had planned to hunt up a glass of lemonade somewhere in the town, before going to friend Snyder's; but I came on him so suddenly that I did not have time. When, however, I invited him to go with me and get some lemonade he replied:

"Oh! we have lots of lemons at home, and nice cool water. Just see if I can't fix you up some that will fill the bill."

My wife says my only excess in the way of drinks is lemonade. And if she had not seen me drink a whole pitcherful after the labors of a hot summer day were over, so many times, she might feel worried as to the result. But it never hurts me a bit—no, not even if I drink a pitcherful just before going to bed. (Of course, I mean a *small* pitcher.) Well, if somebody should ask me where I found the nicest lemonade I ever tasted in my life, I would say that it was the pitcherful that friend Snyder's mother made for me that evening after my walk. Before I got the lemonade, however, I had to be introduced to the little ones of the household. They had all heard of Uncle Amos. Why, bless you, the baby's name was Ernest R. Since God had taken their mamma to her far-away home, friend Snyder has been almost father, and *mother* too,

to the little ones. They help him make garden, and they help him handle the bees; and, oh! isn't that a pretty garden and apiary on the banks of the river? No wonder friend Snyder has christened it "*Riverside Apiary*." We looked at the *Ignotum* tomatoes, and at various vegetables and plants that adorn their pretty little garden, grown from seeds bought of Uncle Amos; and the show of Chapman honey-plants was larger and finer than any thing of the kind I ever saw anywhere else. Why, the great balls were away up above our heads. The bees did not pay much attention to them, however, for basswood was just in its prime at the very time when these were blooming.

It was getting to be bed-time for the little folks, however, and I was duly installed in the big arm-chair and given the family Bible. Before opening it, however, I wanted to know a little more of the particulars just why Uncle Amos came to be such a welcome guest in that little home. Friend Snyder is a "*big man*"—big in a good many ways. His home is but an humble cottage; but for all that, it is a home far pleasanter to me than the finest palace our land can furnish. One of the most beautiful sights I have ever beheld is to see a strong man devoted heart and soul to his own home, his garden, his bees, his children, and to the work of making the home for the little ones around him a pleasant and happy place; and, above all, letting Christ Jesus be "*Lord of all*" in the home. In answer to my inquiries my friend spoke something as follows:

"Mr. Root, my wife and I began reading *GLEANINGS* before we kept any bees at all. I am a carpenter by trade, and one of our neighbors here in Orion employed me one winter to make some bee-hives for him. One day while I was eating my dinner I happened to see a sort of magazine on the work-bench, that Mr. Stewart had been reading, and he probably forgot to take it home. I turned the pages over absently, and finally began to read the coarse print. The style of teaching rather pleased me, although I then neither knew nor cared about bees more than to make the hives as I was directed. I became more interested, and asked Mr. Stewart if he would just as soon lend me a few more of those journals. Of course, he was glad to do so, and through them I became acquainted with A. I. Root. I talked with my wife about it, and in due time we had some bees of our own. Of course, it did not take us very long to find out that A. I. Root was more devoted to one other matter than to the bees; and as we had begun to consider him as our teacher, we followed him through the *Home Papers* and *Our Neighbors*. Pretty soon we felt it a duty and a *privilege* to unite with the little band of Christian workers here in our town, and now you know why I wanted to see you here in my home."

My stay was necessarily short, in order to meet all the friends I expected to meet, or had promised to meet, and on this account I got only a glimpse of the pretty little church by starlight where friend Snyder and his wife had united with the people of

God. Very soon after they had become rooted and grounded in Christ Jesus, it became evident that God was calling his dear companion and the mother of his children to a home beyond. But cheerfully and peacefully she went down through the dark valley; and now that his loved companion is on the other shore, it is not strange that friend Snyder feels all the more drawn to the work of laying up treasures in heaven, as well as doing what he can to make proper provision for the motherless ones in his home. I planned to take a view of the river after sunrise in the morning, and also to visit the bluff mentioned in his letter, before taking my departure; but, alas for human plans! in the morning it was so foggy that getting a photograph of the river was out of the question; I did manage to get a couple of views of his exceedingly neat and pretty apiary, although I had to get it without direct sunshine, which is especially needed for the Kodak. A picture of the apiary will be given in a future number. In the morning, while we were talking, friend Snyder's oldest boy, who helps him with the bees, came in to say that a certain colony, calling it by number, was "hanging out."

"Well, what if they do hang out, my young friend; what do you do about it?"

He replied that his papa did not allow his bees to do that way.

"Ah, indeed," said I. "Well, friend Snyder, if you have a plan for keeping bees from hanging out, I should be glad to see it."

He smilingly replied, that, if he remembered correctly, it was a plan he learned of A. I. Root. His hives have movable bottoms, and in a minute or two a little block was put under each of the four corners. Then the lid of the hive was raised a little so as to let a draft of air through. It did the business. In a little time the bees that were on the front had all gone inside. In this way our friend manages so as to keep all of his bees in the hives; and I am inclined to think that he accomplishes a good thing by so doing; for when the bees commence to go out in the morning, no clusters are observed hanging about on the fronts of the hives while the others are at work. In other apiaries during my visit, many and many a time could I see bees, almost by the bushel, hanging idly on the outsides of the hives, even while the basswood flow was at its height. I am firmly convinced that tons of honey are lost by letting bees loaf when they should be at work. The shop and extracting-room were as neat as a pin. Great broad doors could be swung open at both ends of the building, so as to get any amount of air during the extracting time; and when the bees become troublesome, wire-cloth doors take the place of the ordinary ones.

Another attraction to me was the beautiful springs that bubbled forth at the base of the river bank near the water. There are beautiful fish in the Wisconsin River, and the way they keep fish for sale is to keep them alive in a basin made by one of these springs; then when you want a fish, instead

of going to a meat-market you just go and weigh up a live one, picked out of this spring, with the hands, and there it is, all ready to be dressed.

Some years ago the Wisconsin River was navigable for steamboats; but the Government, in attempting to improve the channel by means of some costly experiments, running up to something like half a million of dollars, did the very opposite of what they intended to do; that is, the theory of the plans did not work, and the river was made entirely unfit for steamers, while it answered very well before they did any thing to it. It is bad enough for individuals to make blunders with their own property; but what shall we say when such blunders as the above are made?

Now, dear friends, I want to tell you that a peculiar tender relation always exists, or at least always should exist, between the one who has been led to Jesus and him who did the leading. There are doubtless many friendships in the world like the friendship of David and Jonathan; but there ought to be a hundred times more of them. Jonathan's father was David's most bitter enemy; but although his persecution and injustice were perhaps as great as any other man ever bore, David would not, even to save himself from harm, touch a hair of Saul's head, or, in his own words, "The Lord forbid that I should stretch forth my hands against the Lord's anointed." His wife was Saul's daughter, and his best friend on earth was Saul's son. No wonder that his forbearance stands out like a landmark to encourage and cheer generation after generation not to become weary in well doing. Sometimes in going over our ledgers the clerks tell me that a certain one is behind in making his payments. When I glance at the name, old recollections come up. Perhaps the one in question was led to Christ years ago by the Home Papers. My directions are at once, "No, no; do not trouble him."

"But," replies the book-keeper, "we have waited a long while."

But my reply is, "Never mind; he will surely pay if it is a possible thing for him to do so; and if he is not, I am willing to lose it."

You see, after the letters that have passed between us we have learned to know each other, and a faith has come up that nothing can dim or diminish. I know this friend will pay me when he can, without taking the trouble to write to him at all. What a pleasant thing it is to have such a faith in your fellow-men!

And now, dear friends, we who are members of the different churches, or, if you choose, we who are followers of Christ, should have just such confidence in each other. We should be of one family, and there should be an especial bond or tie between us, that should say in our hearts, if not in words, "No, no; you must not speak nor write harshly nor unkindly to that man." Sacred and solemn ties make you of one kinship and one blood. "We be brethren."

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

BEES AND RED CLOVER.

IN the Question - Box department not many issues ago, the value of red clover was very lightly esteemed. This year Neighbor H. had 15 acres of peavine clover within an eighth of a mile, or such a matter, of his Lafayette apiary. Our bees had ceased working on white clover and basswood, and robbing was the order of the day. But the bees in the Lafayette apiary, some two miles south, instead of robbing, were busy on red clover. Neighbor H. thought they were just as busy on this as he had ever seen them on white clover; and as he desired me to see it I hitched up Bess (that is my new horse) and went down, accompanied by Elizabeth. Yes, there was that same happy roar in the apiary that we hear during our regular honey season, and bees were tumbling down in front of the entrances heavily loaded. The hives showed that a large amount of this new honey was being gathered. The flavor of the honey was very pronounced. While Elizabeth stayed by Bess to see that she did not break off the end of the thill and kill herself, as did my other horse, I started off a few rods in the direction of the peavine clover. I just wish that those who have any doubt as to whether Italians will work on red clover could have seen the sight that I saw, have seen, and expect to see again. There was the same contented hum of thousands of bees here and there, stopping to take a sip of those great big rosy heads of clover.

THOSE HONEY QUEENS.

It may be that there are some Italians that work better on red clover than others. Perhaps it should be said that the bees of the Lafayette apiary are almost wholly from those two imported honey queens, spoken of in this department before. As the progeny of these queens have shown themselves to be greatly superior to the progeny of other queens, Neighbor H. has made the bees of this apiary almost entirely the descendants of these queens, and the drones are reared entirely from them. While the particular strain of bees may have shown unusual energy on the red clover, yet it is a fact that the average Italians are red-clover bees—at least in our immediate vicinity. Even at our home apiary, when there is a field of red clover within range we almost always notice bees at work on it to a greater or less extent.

SMOKERS; HOW TO MAKE A CLARK SMOKER GO ALL DAY WITHOUT GOING OUT.

I notice that our friend Dr. Miller has some trouble with his smoker going out. As he fills his smoker in much the same way that we do, and as our smoker never goes out after being set fully going, I must lay the difference to the fuel. We use a kind of excelsior, such as I have before explained, that comes from the hand-holes of hives and crates. It is a rather spongy sawdust,

lasts well, and, I think, it never goes out when once *fully lighted*. Dr. Miller's plan of filling the smoker now is, I believe, the same as our own. We grab up a handful of the excelsior, after having made sure that the grate is clear; shove it into the fire-box, and cram in as much as we can, till we have quite a solid mass of packed sawdust and excelsior mixed. We then, with the point of a pencil, or with the end of the finger, punch a draft-hole centrally clear through the fuel. A match is lighted, and the bellows worked. The flame of the match will shoot into this draft-hole, and ignite. The bellows should be worked vigorously for some little time, until the fuel is well on fire. After that the smoke will last for some two or three hours, and never go out. At the end of this time we simply replenish by cramming in more excelsior sawdust, omitting, however, to make a draft-hole, which is unnecessary, on account of the remnant still burning from the first filling. To help Dr. Miller out, and his able assistant Emma, I have decided to send them a bag of this kind of fuel. If it does not work in his hands as it does in ours—well, I will lay it to locality.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

OUR REPORT IN REGARD TO THE NEW VEGETABLES.

AUGUST 15.—The kidney wax bean has once more proved itself so greatly superior to both black German wax and the golden wax bean, that we are strongly inclined to drop the latter altogether. The black German wax is perhaps more tender and succulent when it gets old than the new kidney wax; but it rusts so badly that we feel almost like giving it up. The kidney wax is just as early as either. The pods are much larger, in greater profusion, and the one fact of having great long tender pods of immaculate whiteness, without a speck or blemish, is a big advance. If the beans are hoed when they are wet, they will be spotted, and show something like rust. They answer also very well for the first shell bean; but unless cooked immediately, the beans soon turn to a brownish color which is very forbidding. The white kidney beans are not nearly as forbidding in this respect; and as the York State marrow is a little earlier than any of them for a shell bean, we think we shall put it back in our price list again.

Henderson's bush lima bean is behaving itself admirably. None of them are yet ripe enough to show; but every stalk is loaded with beautiful broad pods, about the size of good-sized peapods, only having the appearance of a regular pole lima bean. The foliage also looks exactly like that of the pole lima.

The beans received from Colorado, that looked so much like Henderson's, all ran up poles. They are therefore, without question, the Seewee, or Carolina pole beans, while Henderson's is the same thing dwarf-

ed. As an illustration of how wonderfully prolific they promise to be, I will mention that I counted 100 pods on a single stalk. But very likely, these will not *all* mature.

This year again emphasizes the value of the Jersey Wakefield cabbage, H. A. March's strain, above any thing offered in the catalogues. The heads are so hard and solid that, if you undertake to handle a barrel of them, you begin to think it must be filled with cast iron; while if you purchase a barrel of cabbages from the city markets, you can toss the barrel into a wagon, without any trouble whatever. We have been planting the Jersey Wakefield pretty much altogether for cabbages during the whole summer. The only trouble is, they burst unless they are gathered promptly; but they are so much harder and so much crisper than any other, our customers willingly pay more for them.

Our celery has given us a great deal of trouble this season, because it runs up to seed, especially during hot weather. If anybody has a strain of celery that will give us early stalks, say in June, and not run up to seed, we should like to get hold of it. The Golden Self-blanching comes the nearest to filling the bill.

The Corey extra-early sweet corn has this season done wonders. We have had roasting-ears on the market for over four weeks before anybody else had any at all; and for all of two weeks we got 2 cts. an ear. We have managed this year so as to have one crop follow another just exactly as we wanted it. There has been no glut in the market, and we have had enough to supply all the demand at fair prices.

We are overloaded with cucumbers, however. We sold them for a good while at 10 cts. a pound, and then at 5 cts.; and now we offer them at a penny apiece, or 60 cts. per 100; and customers can have them just as big or just as little as they choose. The objection to selling cucumbers by the pound when they get to be very plentiful, is, that people begin to call for small ones; and of course we can not sell pickles by the pound at the same price that we do great big cucumbers; therefore they had better be sold by the hundred.

Grand Rapids lettuce and Henderson's New York are the standard kinds of lettuce for hot weather.

The Silver-King onion is the one for the market-gardener, providing he does not have too many at one time. They need to be sold about as fast as harvested, or they will rot.

The Stratagem pea is the standard for us, after we get through with the Alaska and American Wonder. It is not much trouble to sow them or drill them in, every ten days or two weeks.

I am very much pleased to be able to report Henderson's Puritan potato as standing with us at the head of the list. We have never had a nicer potato for cooking, especially for baking, in our household. Well-ripened potatoes, nicely baked, can be shaken out of the peeling by rapping on it with a knife, and the quality is equal to any. The shape is also equal to if not bet-

ter than any other potato we have ever got hold of. They come out of the ground so clean and white that one almost imagines they are *Brahma hens'* eggs. They are not quite as early as the Early Ohio; so the latter will still be retained as a first early potato. Last, but not least, they are wonderfully productive. To get our Early Ohios extra early, we planted large-sized whole potatoes; and, by the way, whenever you want potatoes before anybody else, plant whole ones, or, better still, sprout them in the greenhouse, and pick out the largest potatoes you have. Now, the Puritans were cut, most of the pieces, very small, in order to get the most possible from a limited quantity of seed; but the yield per row was fully equal to the Early Ohio. If it does everywhere as it does with us, it is going to be one of the staple potatoes.

Out of our 13 early pumpkins sent us by kind friends, just one has a ripe pumpkin on the vines at this date. It is not a yellow pumpkin, however, but it is of a light cream color. We are indebted for it to the writer of the following, which came to us on a postal card last winter:

Mr. Root:—I send you to-day a packet of pumpkin seed. It is light yellow in color, a new kind with us. It is excellent for pies. J. T. VAN PETTEN.

Linn, Kan., Feb. 25, 1889.

Burpee has certainly given us an improvement in crook-neck summer squashes. His Mammoth Summer crook-neck is a sight to behold, on account of its immense size, and at the same time the quality is fully equal to the old kind.

The Ignatum and Dwarf Champion tomatoes fully sustain their reputation; but somebody, I can not now remember who, has given us a new tomato that threatens to overturn every thing else. It is the "Peach" tomato. They are wonderfully like peaches, and just as early as any thing we have. They are not very large, however; and the vital point is, can Livingston or somebody else make them larger? Now, it seems to me that friend Livingston and the catalogue makers were all of them singularly dull when they forgot or omitted to tell us that the Peach tomato is in one respect ahead of and above and beyond any other good-sized tomato. It never rots. How do I know? Why, because I recognized it as belonging to the Plum and Pear tomato family just as soon as I saw it, and these have never been known to rot. You may remember that we have discussed this matter before. We had seriously thought of holding on to the King Humbert; but it was shaped so much like a flat-iron instead of egg-shape, as the catalogues gave it, that nobody would have it. Now, the peach tomato has just as pretty a shape as any tomato ever brought out. Some of the specimens are as large as fair-sized peaches, but there are a great many rather small ones. Can it be made larger, and how soon can we have it? I should not omit to mention the fuzz, or bloom. It seems really comical to think that Nature, in her sporting, has copied the fuzz on the peach. But it is so. If you arrange them in a basket so that only the blossom end is visible, you

could cheat people very well. When they turn them over, and look at the stem end, then they discover that it is not a peach.

The Lorillard tomato, with us, rots the worst of any thing we ever got hold of; and almost all of our tomatoes, except the Peach, are rotting at the blossom end before they get ripe. Perhaps after they get down to the business of bearing ripe tomatoes, they will get over it. May be the great abundance of rain has something to do with it.

Our garden for testing honey-plants is now looking very pretty. A bed that was made of a five-cent package of mixed portulacas takes the shine, and also takes pretty much all the bees. The melissa, or bee-balm, is pretty well covered with bees; but owing to the fact that only a few blossoms are out at a time, comparatively, it does not present the scene of activity as do the fig-wort and some others.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, AUG. 15, 1889.

Thy way is in the sea, and thy path in the great waters, and thy footsteps are not known. PSALM 77:19

We notice by the last issue of the *Revista Apicola*, published in Spain, that Frank Benton's present address is Krainburg, Haute Carniole, Austria.

THE ILLUSTRATED HOME JOURNAL.

Published by Thomas G. Newman & Son, of Chicago, Ill., we are glad to recommend as being a first-class publication of the kind. It is well illustrated, and the matter all of it as it should be, suitable for the home. The price per year is now \$1.00 per annum, or we will club it with GLEANINGS for \$1.75.

A GREAT HONEY-YIELD IN TEMPE, ARIZONA.

You will notice by the statistical department that our friend Gregg, of Tempe, Arizona, reports 20,280 lbs. from 190 colonies. Now, this is the more astonishing to me, as Tempe is dependent entirely upon irrigation. They do not have any rain to amount to anything at all, if I am correct. My younger brother lives there, and I believe he is in the near neighborhood of Mr. Gregg. Now, then, friend G., if you have secured a crop of over 20,000 lbs. of honey, you can certainly afford to tell us all about it—what it came from, how you did it, etc. If the honey was produced by irrigation, may be some of the rest of us may bring in irrigation to make our honey crop a little surer than it is at present. In this connection perhaps it would be well to remark that Frank McNay, of Wisconsin, produced 20,000 lbs. from 321 colonies, and S. I. Freeborn, of the same State, 32,000 from 300 colonies. This latter about equals Mr. Gregg's yield per colony. Chas. Dadant & Son secured 35,000 lbs. from 400 colonies.

RAISING CELLS ABOVE QUEEN-EXCLUDING HONEY-BOARDS NOT NEW.

FRIEND Heddon has called our attention to the fact that the subject given in the heading is not new, and that, some five or six years ago, he discovered it was possible to raise cells and young queens above a queen-excluding honey-board. He has referred us to an article which he wrote on page 518 of GLEANINGS for 1885. A paragraph of it reads as follows:

I have also discovered that two queens can be kept in the hive, one on each side of the excluder. In fact, wherever I have used the excluder, as soon as I put eggs and young larvae above it (where the queen could not go), queen-cells were started in quantity. In several instances last season, young queens were hatched. In two such, where we had put the queen above (to test the excluding powers of the board) she remained above, and a young queen was reared, hatched, and fertilized, below. This point is going to be of value to us in future.

He mentions the same thing in his book (published in 1885), on page 78, in similar language. Mr. J. D. Fooshe published the plan as new, and Doolittle corrects him by saying that the same was already given in his book. Now, Mr. Heddon bobs up and says he published it before either, and produces the printed proof. Notice, in friend H.'s last sentence of the paragraph quoted that he (Heddon) had succeeded in having a queen reared and fertilized above the perforated metal. Now, who will bob up and antedate the published report of the whole lot of them? Verily there is nothing new under the sun, or at least it looks that way sometimes.

A KIND WORD FOR THE A B C BOOK.

In the *Review* for August, one of its correspondents complains of the A B C book. The editor is kind enough to make the following points in his reply:

While we do not agree with all of the teachings contained in the A B C of Bee Culture, we regard it as one of the most consistent books ever written. Instead of bewildering the beginner with a thousand and one descriptions of different hives, "traps and calamities," its author sticks to one hive, one system, and one every thing else down through to the last chapter. And while they may not be the best, they hang together; each part fits the other; and if Mr. Root can furnish these things cheaper than the reader can make them, said reader ought to be thankful. We think many of the accusations of "ax-grinding" are unjust. A man doesn't always think an article is best because he adopted it; rather he adopted it because he thought it best. We don't wish to be understood as saying that the A B C mentions only one hive or system, but that the reader who follows the instructions given will never find himself in a muddle by having adopted the parts of two opposing systems.

Many thanks, friend Hutchinson. During my early experiences in bee culture I was so much mixed up and mystified by the advice contained in the different books and agricultural papers on the subject of bee-keeping that I made up my mind to write up a plain, simple book of directions; and you have perhaps put it in words better than I have seen it before; in fact, better than I could have told it myself. The fact that I invented and manufactured many of the goods I described, I have always felt to be in one sense a drawback. On this account I tried to have the A B C book as free from anything like ax-grinding as possible. If I am correct, nowhere in the A B C book is it mentioned that we have the articles for sale, although I have several times said that the expense ought not to exceed a certain amount; and I also gave the very fullest directions possible to enable

each bee-keeper to make his own implements. At the same time, it was difficult to ignore the fact that hives and a good many other things are necessarily made much cheaper when made by machinery than they could be made by hand.

ITALIANS ON RED CLOVER.

ERNEST'S remarks in another column remind me of a talk I had with E. France. We were riding in a buggy past a clover field, and he was so positive that Italians did not work on red clover that I spoke something as follows: "Friend E., if I can't find you Italians—lots of them, on the heads of red clover over in that field, then I shall be very much mistaken." He stopped his buggy, and I clambered over the fence; but to my great astonishment I looked in vain, even where the heads of clover were thickest. Not a honey-bee was to be found, although there were some bumble-bees. Now, in our own State I never before found such a field of clover as that in the month of July, without being able to find at least some Italians on the blossoms; and usually I find them in great numbers; in fact, I have convinced those who were skeptical, by just taking them out into a clover-field. Now, please remember, when you feel like being positive, that things of this kind are quite different in different localities. Perhaps I should add, there were plenty of Italian bees close by the field mentioned.

MARKING SPECIAL HIVES IN THE APIARY.

WHILE at Dr. Miller's I noticed him several times grasping a bunch of grass, clover, or even green foliage from the trees, and tossing it on top of the hive; and as I was making it my business to find fault with every thing, I commenced in this fashion: "Look here, old friend; that green stuff will soon dry up in the sun, and the wind will blow it away. Why don't you take a stick or stone?"

He stopped long enough to put his hand on my shoulder, saying, "My dear brother, that is just exactly what I want it to do. If we can get time we are going to examine the hives thus indicated, before we go away to-day; but if we can not, we do not want any mark left on it. If there is not wind enough to blow it away before we get around again, from its wilted and dried up appearance we shall know that it was put on at the last visit, and not during this present one."

Do you see the point, friends? The green stuff not only indicated that the hive was to be looked after, but it also, by its appearance, made a sort of date, indicating roughly the time the mark was put on the hive. If I am not mistaken, I saw other bee-keepers making use of exactly the same idea.

CONVENTION NOTICES.

The Iowa bee-keepers are anticipating a good time at their annual meeting, to be held on the Edgemoor, during the State Fair, Aug. 30 to Sept. 6.
J. W. MOORE, Sec'y.
Des Moines, Ia.

The Cortland Union Bee-keepers' Association will hold their annual basket picnic at the Floral Trout Park in Cortland, N. Y., Tuesday, Aug. 30, 1889.
M. H. FAIRBANKS, Sec'y.

The fifth semi-annual meeting of the Susquehanna County Bee-keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889. All are cordially invited to attend.
H. M. SKEELEY, Sec'y.

The American International Bee-keepers' Association will meet in the Court-house, Brantford, Canada, Dec. 1, 2, 3, 4, 1889. All bee-keepers are invited to attend. State and district bee-keepers' societies are invited to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Any one desirous of becoming a member, and receiving the last annual report, bound, may do so by forwarding \$1.00 to the secretary.
R. F. HOLTERMANN, Sec'y.
Brantford, Ont., Can.

SPECIAL NOTICES.

MORE ABOUT THE FAIRS.

No doubt many of our readers will make exhibits at their respective fairs, and will exhibit goods you already have, and not take advantage of our offer made a month ago. If any of you who thus exhibit care to distribute advertising matter for us, we shall be pleased to supply you with our usual outfit, and will send along with it free a copy of our cloth-bound A B C as remuneration for your services. We send along with the outfit, instructions for using it. The outfit consists of 100 advertising cards, 25 \$1000 reward cards, 10 price lists, 10 copies of GLEANINGS and 10 GLEANINGS posters. If any of you can use more to advantage, please say how many more, and we can send all together.

TIN AND GLASS HONEY PACKAGES.

We call our readers' attention to our page of honey-packages on the inside of cover to this number. Many of you are already familiar with these and their merits from the way your orders have been coming in. The 5-gallon square cans are now about as cheap as barrels—in fact, cheaper than barrels of the same capacity, and they are better in many ways. They are very convenient to draw from, especially with the little honey-gate to screw on to the cap. When we get honey in barrels, the first thing we do is to empty it into square cans. If we don't, it will very soon get to leaking and making us trouble.

Our new lot of 1000 nests, raised-cover pails, have a handsome swedge and fancy cover, which add much to their appearance. Our carload of glass tumblers and pails have been going so well we have had to get 47 bbls. more stock since the carload came, not two months ago. We have also received many words of praise concerning them from customers.

PRICE LIST OF JONES LITHOGRAPH LABELS.

Name of Label.	Size in Inches.	Price.		Postage.		Print'g Add's		
		100	1000	100	1000	1000	500	250
5-lb. Jones Lithogr'h.	6 1/2 x 14	1 00	9 50	12	1 20	1 00	75	50
2 1/2 ditto	3 1/2 x 14	60	5 00	6	52	1 00	75	50
1 ditto light.	4 1/2 x 9 1/2	50	4 00	4	35	1 00	75	50
1 ditto darker.	4 1/2 x 9 1/2	50	4 00	4	35	1 00	75	50
1/2 ditto.	2 1/2 x 8 1/2	25	2 00	3	28	90	75	50
1/4 ditto.	2 x 7 1/2	25	2 00	3	25	80	75	50
1/8 ditto.	1 1/2 x 5 1/2	15	1 00	2	18	70	75	50
A do., for 1-lb. Cart'n.	4 1/2 x 4 1/2	40	3 50	3	20	1 00	75	50
B do., for " "	4 1/2 x 4 1/2	40	3 50	3	20	1 00	75	50
C do., for 2-lb. " "	5 1/2 x 5 1/2	45	4 00	4	30	1 00	75	50
D do., for " "	3 1/2 x 5 1/2	45	4 00	4	30	1 00	75	50
E ditto.	2 1/2 x 16	50	4 50	4	36			
F ditto.	2 1/2 x 16	50	4 50	4	36			
G ditto.	2 1/2 x 13 1/2	55	5 00	5	42	1 00	75	50
H ditto.	2 1/2 x 13 1/2	55	5 00	5	42			
I ditto.	3 1/2 x 14	60	5 50	6	52	1 00	75	50
J ditto.	2 1/2 x 16	60	5 50	6	52			
Abbott Oval Lith'ph.	2 1/2 x 2 1/2	30	2 00					

Those of you who have never seen these labels can form little idea how handsome they are; and that you may see them without much expense we will put up a sample package of 1 of each kind, and mail postpaid for ten cents. Eight of the above may be divided into 2 and 3 labels each, so that you can get a small lot (over 30) of handsome lithograph labels, no two alike, for only 10 cts. These sample packages would be very good for labeling a small fair exhibit. They would at least add variety. We can not, of course, print your name and address on the sample package or any number less than 100, and those opposite which we give no price for printing, have no blank place for such printing, and hence can not be printed. All the above are ungummed. You can not get lithograph or any colored labels on gummed paper.

IF YOU WANT BEES

That will just "roll" in the honey, try **Moore's Strain of Italians**, the result of ten years' careful breeding. Reduced prices: Warranted queens, each, 70c; 3 for \$2.00. Strong 3 L. frame nucleus, with warranted queen, \$2.50. Safe arrival and satisfaction guaranteed. Those who have never dealt with me, I refer to A. I. Root, who has purchased of me, during past nine years, 405 queens.

THE BUSH LIMA BEANS.

WELL, dear friends, the bush limas are finally big enough to cook, and they are all right, except in size. With us, however, they are not a bit earlier than our extra-early *pole* lima beans. They are, however, a real bush lima bean, and wonderfully prolific. The little bushes are just bending under their loads of pods.

THE lima beans from Northrup, Braslin, Goodwin & Co. did finally stop running up poles, and turned out to be a tolerably fair bush bean. When ready to cook, they look, when shelled, much like a very thick lima bean; and the quality, when cooked, is something about half way between ordinary white beans and a lima bean. It hardly has a lima-bean flavor, and the plant does not look at all like a lima bean. But they are a very rich, toothsome bush

bean. When we first shelled them I decided that we would raise them for a shelled bean for the wagon; but in a few hours my wife called to me that our lima beans had all turned a reddish yellow. Exposure to the air for just a little while made them begin to assume the color they are when ripe and dry. This one thing would unfit them for sale on the wagon, shelled. On the whole, I do not think they have any right at all to be classed with limas.

THE KUMERLE LIMA BEAN

THIS is a true lima bean, and it is fully equal in size to the pole limas. The plant, however, seems to demand a tropical climate. It, as well as Henderson's bush lima, is more tender than our pole limas. I am very much afraid that the Kumerle will not escape frost unless we have very favorable seasons. At present the number of beans on a plant does not begin to compare with the amount on the pole limas. It is true, that, under the influence of heavy manuring and extra cultivation, our pole limas are bearing a tremendous crop; but the bush limas were given the same or better ground, and the very best care. Here is something further that is a little queer in regard to suitable soil for lima beans: While our creek-bottom land, that we thought was so greatly superior for almost every thing, will not raise lima beans worth a cent, our hillsides of heavy clay give beautiful crops season after season. Now, this clay land will bake down as hard as a rock unless it is kept constantly stirred in the summer time, and lightened up by lots of manure. The creek-bottom land has, however, so much sand that its cultivation is always quite easy.

SAVE THE SEED OF YOUR IGNOTUM TOMATO.

THE prospect is, we are not going to be able to anywhere near supply the demand for the seed during the coming season. In fact, we have orders already booked for \$42.00 worth. Save the seed from every tomato; and if you do not want it all, I can probably take it off your hands at a good price. You will notice that the Ignotum is so "full of meat" that it produces very few seeds comparatively.

A STEP FORWARD TOWARDS SUCCESS!

After carefully studying the demand of consumers and dealers, and selecting of the many styles of packages for comb honey the very best and the most attractive, we have now prepared an improved paper carton combined with a comb-protector. Honey, put up in these packages, will be bought in preference to all others at highest market price. Our patent comb-protector will prevent leakage and soiling of sections. Comb honey can be easily and quickly put up in our cartons. These advantages and the small cost of our cartons and comb-protector will save labor, time, money, and honey. Ströhmeyer's patent comb-protectors require $\frac{1}{2}$ inch of the inside height of crates. Price list and sample carton sent free on application.

Sturwold's Show-Case

FOR THE PROTECTION AND DISPLAY OF
HONEY.

In well-equipped retail stores you will find many goods displayed in show-cases. This is because, from their nature they are liable to damage from dust, exposure, and frequent handling. What is more worthy a place under glass than our honey? By adding to its attractiveness it calls the attention of more people to it, and thus increases its sale. We have just made a new lot of cases, similar to the one shown above. We have used chestnut instead of walnut, and have improved the construction of the case so as to make it stronger, lighter, and simpler. To save transportation charges we can finish these all up and then take out the four corner standards and ship "knocked down" and securely boxed. They will thus go as first-class freight, while put up they charge three times first-class rates by freight. By express there would be no difference. Price of the case, put up with glass in, or boxed separately, or knocked down and boxed any of the three ways, will be the same—\$4.00. With name and address on the front glass, \$4.50.

A. I. ROOT, Medina, Ohio.

CHOICE ITALIAN QUEENS.

WRITING AND PENCIL TABLETS.

We have secured a bargain in these, and propose to give you the benefit of it. We have thirteen different styles, of which we give size, number of leaves, name, and price, in the following table. You can write with a pen on any of the tablets, although most of them are designed for penciling.

Name or Designation.	Size in inches.	No. of Leaves.	Post. on 1.	Price of 10
Our Pets Ruled Pencil Tablet.	5 x 8	60	5	3 25
No. 0 Ruled Pencil Tablet.	5 1/2 x 8	70	5	3 25
Ideal Unruled Pencil Tablet.	7 x 10	30	5	4 30
Monumental Unruled ditto.	8 x 12	65	10	5 45
Greenaway Ruled ditto.	7 1/4 x 10 1/2	42	6	5 40
No. 00 Ruled Pencil ditto.	5 1/4 x 10 1/2	70	10	7 60
Geographical ruled ditto.	6 x 9	180	13	7 60
Student's Note-Book.	5 1/2 x 8 1/4	90	8	7 60
America Writing Tablet.	6 x 9	60	8	7 60
No. 36 Writing Tablet.	5 1/4 x 8 1/4	65	8	7 60
No. 65 linen Writing Tablet.	5 3/4 x 8 3/4	80	7	15 20

In case we get out of any one style we reserve the right to substitute one as near like it as possible. Notice, the cost of mailing is greater than the original cost, so that you don't get much benefit of the low price unless you can order with other goods by freight. "Our Pets" has assorted chromo pictures of children with pet animals on the covers. "Ideal" has assorted child's faces. "Monumental" has a picture of Garfield Monument. "Greenaway" series have assorted chromo pictures. "Geographical" have assorted maps of different States. "Student's note-book" is thoroughly bound, cloth back. "America" has lithographic views of several celebrated scenes in America.

THE D. A. JONES CO., BEETON, ONTARIO, CAN.

HONEY COLUMN.

CITY MARKETS.

PHILADELPHIA.—*Honey.*—As nearly as we can learn, the crop of white honey through the East will be short, owing to the wet season, hence the present outlook is favorable for good prices for comb honey put up in 1-lb. and 2-lb. sections, packed in cases of 20 to 24 lbs. each, and put up in neat, clean, and attractive packages. We beg leave to inform all bee-keepers that we are in a position to handle large quantities of honey in the comb, also extracted, and will take an active interest in disposing of honey to the very best advantage. Our commission for doing business is 5%. The season for the crop of honey is just opening, and prices are not fully established. We quote: Fancy white clover, in 1-lb. sections, per lb., 16½¢; 2 lb., 14¢; ordinary grades, 1 to 2¢ less. No buckwheat honey to quote. Extracted honey, white clover, per lb., 8½¢; orange bloom, 7½¢; Southern, off color, 6¢ to 7¢ per gal.; California extracted, in 60-lb. cans, 7½¢; comb, in 6-lb. cases, 13¢ to 14¢. *Bee-swar*, Southern, crude, 23½¢ to 24½¢; Northern, 23¢.

Aug. 15. WALKER & McCORD,
32 & 34 So. Water St., Philadelphia, Pa.

NEW YORK.—*Honey.*—We received several lots of new comb honey, white, 1 and 2 lb. sections. The demand is fair; the market just about opening, although the weather is very warm. We quote: fancy white, 1 lb., glassed and unglassed, 16¢; 2 lb., 14¢; fair white, 1 lb., 14¢; 2 lb., 12¢. Extracted remains firm, with a first-class demand for all kinds, and brings the following prices on arrival: Orange blossom, 7½¢ to 8¢ per lb.; white clover and basswood, 8¢ to 8½¢; Southern strained, average quality, 6¢ to 7¢ per gal. Send in your extracted honey now and get immediate returns.

HILDRETH BROS. & SEGELKEN,
New York.

CINCINNATI.—*Honey.*—Demand for extracted honey is fair from manufacturers, and fair from consumers for table use. It brings 5¢ to 6¢ on arrival. Arrivals are good. There is a good demand for best qualities of comb honey, while inferior grades find a slow sale. It brings 11¢ to 15¢ in a jobbing way. *Bee-swar* is in good demand and sells readily at 20¢ to 22¢ on arrival for good to choice yellow.

Aug. 21. CHAS. F. MUTH & SON,
Cincinnati, Ohio.

ST. LOUIS.—*Honey.* The market is very quiet. Too much fruit at low prices to leave any room for rushing it. Moving slowly; choice white clover, comb, in 1-lb. sections, single tier preferred, 12¢ to 12½¢; larger sized sections, 10¢ to 11¢. Extracted, in cans, 5½¢ to 6½¢; bbl., 5¢ to 5½¢; Southern, 4½¢ to 5¢. — *Bee-swar*, prime, 23½¢; small orders more.

Aug. 21. W. B. WESTCOTT & Co.,
St. Louis, Mo.

NEW YORK.—*Honey.*—Extracted, California, 7½¢ to 8¢; orange bloom, 7½¢ to 8¢; common Southern, 65¢ to 75¢ per gal.; white clover and basswood, 7½¢ to 8¢; comb honey, 1 lb., fancy white, 16¢; 1 lb., fair, 14¢; 2-lb. sections, 2¢ less. As prices are about 10 per cent lower this season than last year, we expect a very active demand early in the season.

Aug. 21. F. G. STROHMEYER & Co.,
New York.

COLUMBUS.—*Honey.*—Home honey about exhausted. White-clover honey in 1-lb. sections, 16¢ to 17¢. Early consignments would be profitable, and meet with ready sale. Last week we closed out 75 cases (13 lbs. to the case) from 15¢ to 17¢. Extracted honey slow.

Aug. 20. EARLE CLICKENGER,
Columbus, Ohio.

KANSAS CITY.—*Honey.*—New crop arriving freely; demand light; 1-lb. sections, white clover, 16¢; 2 lb., 14¢; extracted, 8½¢ to 9¢; dark, 6½¢ to 7¢.

Aug. 21. HAMBLIN & BEARSS,
Kansas City, Mo.

BOSTON.—*Honey.*—Honey has arrived quite freely. Sales are a little slow; 1-lb. comb is selling from 17¢ to 18¢; 2 lb. from 15¢ to 17¢; extracted from 8¢ to 9¢.

Aug. 21. BLAKE & RIPLEY,
Boston, Mass.

KANSAS CITY.—*Honey.*—Receipts of comb honey large. Market slow, at 14¢ to 15¢ for 1-lb. white comb; 13¢ to 14¢ for 2 lb. White, extracted, 7¢ to 8¢; dark, 6¢. *Bee-swar*, 20¢ to 25¢. CLEMONS, CLOON & Co.,
Aug. 22. Kansas City, Mo.

ALBANY.—*Honey.*—Weather too hot yet for much of a demand in honey, but as soon as changes, look for good prices. Honey consignments and correspondence solicited. H. R. WRIGHT,
Aug. 21. Albany, N.Y.

ST. LOUIS.—*Honey.*—Market very quiet, and declining. We quote extracted at 5¢ to 5½¢; comb, white clover, 12¢ to 12½¢; fair, 10¢ to 11¢. *Bee-swar*, 24¢. D. G. TUTT Gro. Co.,
Aug. 21. St. Louis, Mo.

DETROIT.—*Honey.*—New honey coming in very slowly, and selling at 14¢ to 15¢ for 1-lb. sections. *Bee-swar*, 23¢. M. H. HUNT,
Bell Branch, Mich., Aug. 21.

WANTED.—500 lbs. of nice comb honey.
A. D. ELLINGWOOD, Milan, N. H.

FOR SALE.—1000 lbs. extra choice clover and basswood honey, in 1-lb. sections and 12-lb. cases, at 15¢ per lb., delivered at the depot of any one of five different railroads.

FRANK DURAND, Esdaile, Pierce Co., Wis.

FOR SALE.—2500 lbs. of choice white clover and basswood honey, put up in 60-lb. screw-top cans, at 8¢ per lb.

F. W. HOLMES, Cooperville, Ottawa Co., Mich.

FOR SALE.—4000 lbs. extracted clover and basswood, in 10-gal. kegs, at 10¢ per lb., kegs thrown in.

M. ISBELL, Norwich, Chenango Co., N. Y.

FOR SALE.—Quite a quantity of white clover and basswood honey, put up in 60-lb. square cans. Will take \$4.75 per can at my place. Correspondence solicited. 17-18d H. L. ROUSE, Republic, Iowa.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15¢ per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight.

OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.
17tdfb

FOR SALE.—10,000 lbs. of choice white-clover honey, in first-quality 1-lb. sections, 24 and 48 lb. cases, delivered free on board cars at Dixon, at 13 cts. per lb. If you want 1000 lbs. or more, write for special prices. 17-18d EZRA BAER, Dixon, Ill.

FOR SALE.—25,000 lbs. choice extracted white-clover honey, in barrels holding about 550 lbs. net, each. I put it up also in packages of any size desired, in either wood or tin. There is no finer honey than this in the market. Write me what you want, and I will give you prices.

EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

CONVENTION NOTICES.

The Iowa bee-keepers are anticipating a good time at their annual meeting, to be held on the fairground, during the State Fair, Aug. 30 to Sept. 6. J. W. MOORE, Sec'y.
Des Moines, Ia.

The fifth semi-annual meeting of the Susquehanna County Bee-keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1899. All are cordially invited to attend. H. M. SEELEY, Sec'y.

The American International Bee-keepers' Association will meet in the Court-house, Brantford, Canada, Dec. 4, 5, 6, 1899. All bee-keepers are invited to attend. State and district bee-keepers' societies are invited to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Any one desirous of becoming a member, and receiving the last annual report, bound, may do so by forwarding \$1.00 to the secretary. R. F. HOLTERMAN, Sec'y.
Brantford, Ont., Can.

The Northwestern Bee-keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., Chicago, on Friday and Saturday, Oct. 11 and 12, at 9 a.m. Arrangements have been made with the hotel for back room, one bed, two persons, \$1.75 per day, each; front room, \$2 per day, each person. This date occurs during the exposition, when excursion rates on the railroads will be one fare for the round trip, good from Oct. 10 to 14, inclusive. There has been a large crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation." W. Z. HUTCHINSON, Sec'y.

Vol. XVII.

SEPT. 1, 1889.

No. 17.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid in the U. S. and Canada. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries NOT of the U. P. U., 42 cts. per year extra.

OUT-APIARIES, NO. XIV.

MEMORANDUM OF WORK TO BE DONE.

MUCH method and planning about your work is not so necessary with only a few colonies; but as the number increases it becomes more necessary; and when your bees occupy two or more apiaries it becomes very necessary that you know beforehand just what you are to do. So it is important, not only to keep a record of what has been done, but to keep a concise memorandum of what is to be done. This can be kept very conveniently in your record-book. I usually put it in the back part of the book. On the left-hand margin of the page, write the dates of the month and the days of the week; and as fast as you know what is to be done ahead, enter the number of the colony to be treated; and if you think best, use some character or letter to indicate what is to be done. I don't mean to say that every thing of your regular work is to be put down, only the unusual things that you might forget, especially those things that might make considerable trouble if you did forget. A part of your memorandum might be like this:

June.

1. Sat. 5, 18, 57, 63.

— o c l y

3. Mon. 219, 234, 238, 242, 259.

a o n

4. Tues. 128, 146.

5. Wed. 304, 315, 322.

— y

This means, that on Saturday, June 1, queen-cells are to be destroyed in No. 5. See if there are any eggs in 18; clip the queen of 57, and so on. You will have to look at your record to see what is to be done with 219, and others which have no marks

under them. Sometimes a rainy day will occur, making it necessary to change your arrangements, and then you will find it of great advantage to have your memorandum and your record, for then you have all your apiaries before you, and can plan understandingly, and not leave some important thing too long.

In another place in your book, make a memorandum of any thing that you want taken to any of the out-apiaries. For instance, at a certain apiary where you are to-day, you find you will need so many empty hives, frames, boards for stands, or what not. If you trust to memory you may go next time and leave some needed thing at home, the lack of which may discommode you very much.

OUT-APIARIES RUN WITH NATURAL SWARMING.

If you are a strong advocate of natural swarming you will have some one at each of your apiaries during the busy season, and it depends upon circumstances and your own views of management whether you shall have some cheap hand, merely to watch for swarms and get them hived in some sort of shape, or have efficient help at each apiary while you go around from one apiary to another and have a general oversight over all. Adam Grimm followed the latter plan, I believe. One of the most successful bee-keepers in the country has for each apiary a man capable of running it, and each one of these lives in the village and makes a report at headquarters, every evening, of the doings of the day, going back to his own apiary the next morning. In this case each man has his own conveyance, and hauls for himself the necessary hives, sections, etc. In the other cases you will take with you to the different apiaries whatever may be needed.

I say nothing about management of first and second swarms, for I don't know that there is any thing about it peculiar to out-apiaries.

OUT-APIARIES WITHOUT SWARMING.

Without attempting to discuss whether it is better to encourage or discourage natural swarming, I may say that there are many bee-keepers who think it better on the whole to suppress swarming, either to some extent or as much as possible. If, like some others, you have been trying to find some way by which you could get your bees to work right on through the harvest without any attempt at swarming, when working for comb honey, I am quite safe in saying that your desire to find such a way will be greatly intensified when you come to establish one or more out-apiaries. For whatever may have been the case with one apiary, if you do not desire swarming it will certainly be a great convenience to be able to leave an out-apiary for three days or a week with little or no anxiety about what the bees may do in the way of swarming. To prevent increase is quite an easy matter, for any one can double up; but to prevent swarming is quite another thing. This is not the place to discuss plans to prevent swarming; but I may say that, although I am not without hope that some one may find out a better way, I am not sure now of any way except the one which is probably familiar to you, of keeping the queen caged or out of the hive during the swarming season. "But," you say, "doesn't the absence of the queen or the loss of so much brood during the working season prove detrimental?" Quite likely; but the fact that such men as Capt. Hetherington and P. H. Elwood practice on this plan, shows that they think more is to be gained than lost by it. Even if it should require just as much work during the season as to allow natural swarming, the work can be more evenly distributed; for if you have 100 swarms in 10 days it is any thing but certain that you will have exactly ten each day. Besides, I suspect that three or four persons can take care of more bees by going about from one apiary to another than if each one were obliged to stay in his own place.

Another thing that is quite an item to some, is that it is very much pleasanter to have company, and go together from one apiary to another, than to work alone each day.

Mind you, I'm not insisting that for *you* it is best to try to have no swarming. If you have great faith in natural swarming (and some of our best men have), swarm away to your heart's content. I'm only saying that, if you have a leaning toward the suppression of swarming, you will lean *away* over when you have more than one apiary. What I have said applies particularly to apiaries run for comb honey. If you run for extracted, of course the danger of swarming is very much lessened.

Marengo, Ill.

C. C. MILLER.

ITEMS FROM THE APIARY.

HOW TO TELL WHEN A COLONY IS QUEENLESS.

AT this season of the year we often examine the old colonies in our apiary which have cast swarms, to see if the young queens in the same have commenced to lay. In doing this we often find colonies which have the cells all cleaned out and prepared for the queens, yet there are no eggs in them. I used to think, that where I found cells thus prepared it was a sure sign that the queen was present and was about commencing to lay; but years of experience have taught me that this can not always be depended up-

on; and if a hive is left without further looking after, it often happens that they remain queenless so long that fertile workers get possession of the combs, in which case it is about as well to break up the colony as to try to make them accept a queen. Finding some colonies in the above shape, apparently with queens just ready to lay, I thought I would not wait and look again, as I generally have, often hunting some time for the queen when I did not see eggs, so I went to some of my other colonies, and took frames from them which contained plenty of brood in the egg and larval state, and placed it in the center of each of these doubtful colonies. In four days I went to these colonies again, when all I had to do to tell whether they were queenless or not was to lift these combs I had set in and see whether there were queen-cells on them or not. To my surprise over half of them had queen-cells on them, thus proving conclusively that they were queenless. Now, being positive that they had no queens, all I had to do to introduce one was to take away these frames of brood, put them back in the hives where they came from, and in an hour, when these were mourning because of the loss of this brood, roll a queen in honey and drop her in the hive at the top of the frames, resting assured that she would be well received, for I never lost a queen when put in a hive under these conditions. A frame of brood containing eggs and larvæ placed in any doubtful colony will always tell whether they are queenless or not, yet from the many reports of losses of queens which I have received, it would seem that queens are largely ordered for supposed queenless colonies, and then lost in trying to introduce them to a colony having something they are reverencing as a queen.

SEVERAL QUEENS IN A HIVE.

Just before the honey harvest closed, a swarm came out unexpectedly one day, and, not caring to bother with it at that time, as I was in a hurry, I paid no attention to them, except to cage the queen at the entrance of the hive, and in an hour or two, when passing that way, liberate her, letting her run into the hive. I intended to look the hive over in a day or two and cut the queen-cells off, if the bees had not already done so; but being extremely busy I did not get at it till over two weeks had passed. Passing by this hive one day I saw that this colony had many drones flying, while nearly every other colony in the yard had killed off their drones. I at once resolved to open the hive, which I did. On lifting the first frame I found two queen-cells from which queens had hatched, neither of which showed any signs of being gnawed into at the sides, as they generally show where a young queen hatches after swarming is given up, for under such circumstances the bees and young queen soon destroy all of the rest of the cells. The next comb contained another queen-cell, showing that this one had also hatched a queen from it, and so I kept on finding queen-cells from which queens had hatched to the number of six or seven, all looking as if the queens had been out of them for several days. On the second frame I found a young virgin queen, evidently a week or more old, and others of about the same age on other frames, till I had counted five. There was no piping or quarreling on the part of the queens, and the bees did not pay any attention to them. The singular part of it was their age, and the time of year. It is nothing singular to find several *very young* queens at liberty together in the

height of the honey-harvest; but to find queens a week or more old, all dwelling in harmony, at a time when robbers were so thick that a tent was required to work with the bees to any amount, seems a little singular. Has any one else had a like experience?

SKUNKS IN THE APIARY.

Under one of the hives at the end of the apiary nearest the woods which come close to one side of the same, and which act as a windbreak, was a large bumble-bee's nest, judging from the number of bumble-bees which were seen going in and out a couple of weeks ago. I had known that they were there, for some time, and had left them from curiosity, showing them to visitors when they came. One morning in passing by this hive I saw that the nest had been dug out the night before, and the bees and most of the comb eaten. One bumble-bee and a little comb was all there was left of the once prosperous family. I was sorry, for I believed this was only the commencement of a raid on my hives, for this is not the first time I have been bothered with skunks. The next night but one the hive next where this bumble-bee's nest was, was disturbed; and now the apiary is visited nightly by these gentlemen. I am about setting traps for them, but I should have much preferred that they stay away, for it is no pleasure for me to have any thing to do with them. Their mode of procedure is to go to a hive, keep scratching on the front of it till the bees come out, when they catch them and eat them. In this way the hives visited the most are badly depopulated; and if they are not caught, much harm to the colonies is the result. If the hives were well up from the ground they would not be troubled; but where low down, the only way I know of is to catch and kill them. I think that they prefer the bees with honey in their sacs, and I believe that they scratch on the hives so that the bees will partially fill themselves with honey, for dead drones and some workers are thick in front of some hives, yet none of them are touched.

G. M. DOOLITTLE.

Borodino, N. Y., Aug. 16, 1889.

I am very glad, friend D., that you have mentioned this matter of ordering queens for hives when they are not queenless. Over and over again novices have imagined that their hives were queenless, and sometimes have bought expensive queens, only to have them killed in trying to introduce them. You may remember that I have repeatedly urged that unsealed brood should always be found in every hive. While a colony is rearing a young queen, and just about the time she is taking her wedding-flight, I should greatly prefer that there be some brood in the hive for the very reason you mention. A glance at this frame of brood, to see when they have queen-cells started, will always tell when any thing has happened to the queen. Now, in your case I should by no means take out this frame of brood and put it back, when I wanted to introduce the queens. Just let it alone; and, if you will excuse me, neither would I roll the queen in honey. Whenever we have reason to suspect that a colony is queenless, and find queen-cells started after giving them brood, I should let any laying queen loose at once without any ceremony. It has been such a very rare thing in our experience to lose a queen under these circum-

stances, I prefer to take the risk of loss. Besides, I do not believe the risk will be much if any greater than by any other mode of introducing under such circumstances. Please remember, however, the conditions. The colony must first have been queenless, and without any brood from which to rear a queen. Now give them some brood, and, after the cells are started, to indicate you have made no mistake, they will accept any laying queen let in by any method that is handiest; and turning her loose at the entrance is just as good as any other way. If, however, robbers are troublesome, I think I would wait until so near dark that no robbers will be flying. I do not remember of ever finding several virgin queens in a hive under such circumstances as you mention. —In regard to skunks, why not poison them, as I mention in my California notes? A method of poisoning is also given in the A B C book. One who is acquainted with the habits of skunks can tell at a glance where they have been at work, by the scratching of gravel and weeds in front of the hive, and also, usually, the marks of their claws on the hive around the entrance.

BEE-VEILS.

THE GLASS FRONT.

IF you will excuse another head-dress for beekeepers, I beg leave to introduce to your readers what is known as the "Ideal" glass-front veil. The great objection, at first urged, of the moisture of the breath forming upon the glass in cool weather, and thereby obstructing the vision, has been overcome in adjusting the glass a little higher, bringing it above the mouth, the breath passing through the veil below; but I must admit that our manner of fastening glass in the body of the veil has not altogether succeeded against the excessive heat in the extreme Southern States for long-continued use.

THE GLASS-FRONT VEIL.

The majority of veils made have been of grena-dine, rubber cord at top and bottom, some preferring the bottom loose to tuck under the vest or suspenders; but my "better half" suggests a cord with a slip-knot below, by all means to come around the dress collar and hook on the dress button, for the wives and daughters. For the glass front we lay claim to the following advantages:

Convenience of arrangement; absolute protection of face and head; freedom of vision; while the glass is large enough to allow a good range of vision, it is so light and strong and ingeniously inserted in the body of the veil as to remove all objections to glass on account of liability to be broken, hence durability. It will not injure the eye by continued use, as friend A. H. K. Blood, of Quincy, Mass., wrote me has happened his eyes by the use of the no-glass veil.

The glass will be broken only through carelessness, and will last for seasons. The sense of complete comfort, and freedom of vision, will more than pay for the care of the glass. I am a practical bee keeper who believes that there are times and conditions necessitating the most experienced to protect their face; at least, discretion is the better part of valor.

JNO. C. CAPEHART.

St. Albans, W. Va., July 19, 1889.

We tried your glass-front veil, and did not like it. The glass would continually get out of range—one eye would look through the glass and one eye through the meshes of the veil. The only way to remedy this difficulty would be to make it larger, and that would be impractical. Again, moisture would with us rise from the breath and collect upon the glass, and then it was about as transparent as—well, cheese-cloth. A fine silk brussels-net facing affords almost no obstruction to the eyes, and at the same time it may be made large enough so that it is not at all likely to get out of range. Our glass front finally got broken, and we thought we were careful too.

MY EXPERIENCE WITH CARNIOLANS.

GREAT SWARMERS, AND NO MORE GENTLE THAN ITALIANS.

LAST September and October I bought eight Carniolan queens of Dr. Morrison. I had an unusual amount of trouble in introducing them, losing three. One of the three was apparently introduced and then was missing. I thought perhaps she was a virgin queen, and flew out to meet the drones. I think Dr. M. afterward stated in GLEANINGS that he failed to get his young queens to lay in September and October. At any rate I could not persuade them to lay, and I do not think I raised a bee from one of them until spring. Two of the fine queens were lost in wintering, from lack of stores—the only ones lost in winter out of 37 colonies. This left me three to commence this season with. They bred up rapidly, and began to swarm in May, and have swarmed ever since, or would if permitted to. I think they are rather more inclined to swarm than Italians or blacks. All three hives after swarming filled up with bees from the young queens, and swarmed—one the 12th of July, in a dearth of honey, and one last Friday, Aug. 16th, with no honey coming in. It was a rousing big swarm. To-day I have returned them. I will tell you the condition of the hive:

Common shallow L. hive, 10 frames, and set of sections over them, with no honey-board. Were the sections full of honey? Not a drop. The first comb removed, an outside one, had no honey in the outside; the other side was perhaps a third full, and a few capped cells. The next two combs had

some honey, but no brood. The remaining seven had brood and honey, and perhaps 5 queen cells capped, which I removed. Then I returned the swarm which stood close by. I should have done it the same day, but I had other work to do. I do not see that they handle any better than the gentle strains of Italians, though I have not had enough of them to give this point a thorough trial. With regard to their honey-gathering qualities, I can form no opinion in this disastrous year.

Walpole, N. H., Aug. 19, 1889. J. L. HUBBARD.

MRS. HARRISON WRITES A BLUE LETTER.

WHAT ARE YOU GOING TO DO ABOUT IT?

WE received a letter lately from Mrs. Chad-dock, who is still playing on the same harp. She says, "It does not pay to bother with bees in this part of the country. I have said so before—I say it again." She is selling honey at 10 cents per pound. How does this compare with the price of honey? I sold six gallons of blackberries at 10 cents per gallon, the purchaser picking them. "Just as nice blackberries as I ever saw have been selling all the season in Ipava for 10 and 12½ cents a gallon." "Wheat crop is poor—some kind of a bug is in the stalk; oats lodged, and wasted about a third."

I saw in the morning's paper that oats were selling at a railroad station in an adjoining county for 18 cts. per bushel. It would be well for those who are continually complaining of the low price of our product, to compare it with other agricultural pursuits. Compute the interest on land, implements, teams, seed, and labor, and note the result; also on our investments in hives, implements, etc., used in the apiary, and compare notes. There has not been a large crop of honey, so far, in Illinois, that I have been able to learn. To much rain, and such cool nights; yet choice honey in one-pound sections has been selling in this city and neighboring towns at a less price than I ever knew it to be sold at before. Some was sent here to a commission house who wanted it out of their way, and they sold it to a huckster for 8 cts. per lb. He must now get his money back, and he hawks it around for 10 cts.; at the same time, grocery men were retailing at 15 cts. "What are you going to do about it?"

Peoria, Ill.

MRS. L. HARRISON.

Mrs. H., suppose you stop raising honey and blackberries and oats, and, in fact, farm crops in general, what other business would you go into? There has been a constant demand—an unfilled want, perhaps—for some kind of business or industry that does not have its ups and downs. But no such thing has been found, that I know of. Remember the statistics Farmers succeed in at least making an honorable living, 95 times out of 100. No other industry makes a showing any thing near as good; and, in fact, the whole mercantile world makes a showing of 95 failures, sooner or later, out of every 100. I think that, in your own locality, large quantities of honey, blackberries, yes, and oats, have been sold at good prices, notwithstanding the short intervals when these things for a time went away down.

CASES OF SEVERE STINGING; WHISKY AS AN ANTIDOTE.

IS THE REMEDY WORSE THAN THE DISEASE?

HAVING seen the clipping referred to in the *St. Louis Republic* I will say that the circumstance was published in two of our county papers. One said that the man referred to, Mr. Henry Wright, was stung on one ear, and the other on both ears, which last I think is correct, and that he died from the effect of the stings in about 30 minutes. I don't know this to be a positive fact, but I believe it is. I was at Paris, our county seat, last Wednesday, and was told there that it was a fact. I can also give you some more instances of stings that were serious. I have a special friend that lives about nine miles from me, and I have the statement from himself, that, about three weeks ago, his wife received a sting on the back of her head which came very near proving fatal. She became deathly sick, and turned very sick at her stomach. She ate honey very freely, which she could not do when well, and drank whisky freely, which she could not do when well, and two bottles of liniment were used on her, called "Wonderful Light." She turned spotted all over. My friend thinks it was a very narrow escape.

Another case was my little boy, 10 years old, who received a sting on his left breast just a little below the heart, from a bumble-bee. He did not complain much for about half an hour, when he began to swell up in his throat, and could scarcely get his breath. When I saw him in that fix I went, for a doctor, thinking he would know what best to do; but while I was gone, my wife, who had a little whisky, gave my boy a little, and he was some better. When I got back with the doctor, which was only a few minutes, he gave some more whisky and some other medicine; I do not know what, but I think it was the whisky that gave him the relief. I am a strong temperance and prohibition man; but my wife had her arm broken some three weeks ago, and the doctor recommended whisky for her. I don't believe it did her a particle of good; but in the bee-stings referred to, I believe it did. There might be, and I believe are, other remedies that would answer in the place; but the doctors will recommend whisky; and as long as we don't know any thing better, we shall have to use it or take nothing.

I will give you one more case—that of myself. I received about 35 stings one day while hiving a swarm in the rain. I got them all over my hands and face, and neck and head, but I did not give up. I should very likely have got very sick if I had given up; but I kept going, and soon got all right again.

J. W. ROUSE.

Santa Fe, Monroe Co., Mo., July 20, 1889.

I am glad to hear you say that you are a strong temperance man. When I began reading your letter I felt afraid that you were not sufficiently aware of the danger of recommending such a remedy. Now, I do not want to be unreasonable, nor do I want to be considered a fanatic in the matter of temperance; but I do think that we had better let a few people die rather than to recommend whisky for every one who becomes frightened at the effects of a bee-sting. You have given us an instance of one man who died from the effects of bee-stings.

Now, is it certain that whisky would have saved him? and is it certain that your friend's wife was saved by whisky? In the case of the little boy who was in danger of choking to death, it was a desperate state of affairs, and I presume likely we should have done as your wife did. But, for all that, have we any good reason for thinking that it was the whisky that saved him? I have already told you of being stung myself, so that my throat began to swell in a way that frightened me. But the swelling ceased and disappeared itself, and that without any remedy whatever. In your concluding sentence it seems to me that you strike at a great truth that can not harm any of us to consider well, and put in practice. You say you should have been very sick if you had given up. Now, I do believe in keeping on at your work when you are stung, or when you are injured in other ways. I believe that nature will take care of things better if you keep on about your regular business—that is, within the bounds of reason. Perhaps while you keep at work you keep up the circulation; and Ernest, who is sitting by while I dictate, suggests that whisky may possibly start the circulation so as to help the system to rally and keep up till the effects of the poison begin to abate. If this is true, whisky may, in this way, save life in some cases. In this matter I feel a great longing for wise counsel from our ablest physicians—those, too, who are not prejudiced in favor of whisky. Nay, further: Let us all pray that the kind Father may guide us safely, and that Satan may not lead us astray in this matter of using so dangerous a poison as a remedy for bee-stings. Once more: It surely is better that a few people should die now and then for the lack of whisky (if they ever do, which I am by no means sure of) than that thousands upon thousands should keep dying continually, and in spite of every thing that the whole world is able to do, because somehow or other they get the taste of whisky and become enslaved by the bad habit.

NO HONEY.

THE SEASON WORSE THAN THE TWO PRECEDING.

THOSE were false prophets who predicted a good honey crop this year. It is even worse than the two or three preceding years. The Middle Atlantic States have been subjected to a literal downpour of rain for the last three or four months, with a fair prospect of a continuance of the same. Apple-bloom was about two weeks earlier than common, and the weather was warm and reasonably fair, so the bees did well and got a good start. Some of the strongest colonies prepared for swarming. Locust, which is abundant here, and poplar (tulip) came into bloom early, following closely the fall of the apple-blossoms, and the bees for a day or so after the opening had warm weather, and fairly tumbled over each other when carrying in their harvest. But the second day after the honey-flow, came the flood of rain, which did not let up till the locust and poplar blossoms were destroyed. White and alsike clover were in the meantime pushing out their

blossoms, but the bees could snatch only an hour now and then—seldom a whole day—to gather the nectar. Some of the very strongest colonies filled a case of sections, mostly in a skimmed, rounded-off, indifferent manner, after their fashion when supplies are scarce.

The rain has continued, day and night, all the time; and the bees had to live partially on what they had gathered. If it ever clears up, the asters, goldenrods, heart's-ease, and other fall honey-producing weeds will give a good fall crop, the wet season having given them a good start; but that little champion "if" stands in the middle of the path of prediction, defying the wisdom of sages. No honey worth naming is the return from all of the Atlantic States, which I believe will include all the country east of the Alleghanies.

E. E. EWING.

Rising Sun, Md.

TROPICAL FRUITS.

DESCRIBED AND PICTURED BY ONE OF OUR MISSIONARIES; ALSO SOMETHING ABOUT THE FRUITS OF THE MISSION WORK.

DEAR BROTHER:—Most of the fruits in this country grow in their natural state; and when your horticultural readers see what splendid specimens we have they will wonder what they might become with proper culture, and effort at improvement. Many of the larger fruits, such as the huge "jack-fruit," on the upper left-hand side of the picture, grow on very big trees. In the States they would be classed among forest-trees, and they appear very strange to the new comer, with these watermelon-shaped fruits hanging from the trunk or larger limbs, just as though they had been artificially tied or fastened there. The durian (*doo-re-en*) tree is also a big one; bigger, indeed, than the "jack." It grows forty and fifty feet, with a spreading top. There is one, however, in our compound that shoots up thirty feet a straight and rather rugged trunk, and then suddenly spreads out, umbrella fashion. The coconut is the most kingly and majestic of all trees. The green coconut is seen on the left next to the "jack." A coconut orchard is a sight never to be forgotten. Their slender, graceful stems, rise from thirty to fifty feet, unbroken by any branch or bump, and terminating in the victorious cluster of waving flocks. The trunk is a drab brown, the branches a rich green. The seashores are here and there lined with orchards. Only last Saturday we (Chinese schoolboys, teachers, missionaries and all) went across the harbor and spent the day picnicking under the shade of a coconut-palm orchard. We bathed in the surf, ate green coconuts (the pulpy meat of which is very nice), lunched, gathered shells from the beach, and toward evening were rowed home over the two miles' journey by Chinese boatman. They stood in the wide rear end of their "sampans," and propelled their boats, facing ahead, by holding the end of their right oar in their left hand and the end of the left oar in their right. I leave it to your readers to find out how they could do this, but I leave them with the assurance that hundreds of them earn a livelihood working in just that position in rowing.

The small round fruit with white pulp in a dark purple shuck is the mangostine. It is seen just at the bottom, on the right of the picture. This is a most luscious and refreshing fruit. The flavor of

a rich grape comes the nearest to it of any thing you have in the States. It is about the size of an ordinary apple, and the tree strongly resembles an apple in shape and in the appearance of the leaves and fruit. The shell makes an imperishable dye, like the walnut shuck. It stains a knife black, and nothing but the juice of the pulp will remove it.

The small fruit, of a hairy appearance, down in the left corner, is the rambutan (*ram-boot-an*). Its name means "hair." *Rambut* is the Malay word for hair. The fruit is inclosed in a leathery husk or skin which fits closely upon the egg-shaped ball within. When it is opened, the fruit looks like a California grape, but is not so acceptable for eating. It has a big seed, and the juicy, tart (or sweet) pulp adheres firmly to the seed. It is eaten by being put into the mouth, and worried and sucked until the juice is all extracted. It makes fine jelly. Most fruits here are sub-acid, although the oranges on the island are very sour. Some may be seen on the tureen.

The fruit on the left—long, labeled, and corked, is exceedingly common here. More of this is consumed than of any other or all others combined. It produces a peculiar sensation when eaten, and causes sound-minded people to do very foolish things. Other varieties of the same species flourish in America, but I think it will be abandoned there after a few years. It affects Tamils and Chinese just the same as Englishmen, and yet is a source of very great revenue to the Government. I think all who see the picture will agree with me that it is an evil thing, and should be cast out, root and branch.

I ought not to leave the fruits without mentioning how the *durien* is eaten and relished by some, and how it is not eaten but disliked, even hated, by others. The pulp is very soft, having the consistency of a rich cream custard, which is distributed over the surface of a seed about the size and shape of a bantam's egg. The pulp is kept in shape by a thin film covering the custard. If you add a strong extract of the odor of Limburger cheese and a slight onion flavor, you have the durien. It is very difficult to learn to eat it. Some never learn; but when once acquired, the taste for it grows until it becomes almost a passion. I think there is no fruit in the world so fine. They sell for ten and fifteen cents a pound. Two crops of all fruits grow here every year.

But there are other good fruits I will mention in closing. We have in our Anglo-Chinese school 360, mostly Chinese boys, with their smooth-shaven heads, long pig-tails, and wide coats and trowsers. I teach seventy of them every day, and I have learned to love them dearly, and some of them have already learned to know and to love Jesus Christ.

We have sixteen of them in the boarding department, most of whom come from the wealthiest Chinese homes in this city of nearly 200,000 people, most of whom are Chinamen. One of these boarders is a bright fellow of fifteen who is studying Latin, English analysis, English history, and advanced arithmetic. He is something of a musician, and draws beautifully for one never taught. He heard the Child's Story of the Gospels read at morning prayers for three years; he heard and saw Christianity simplified, and soon came to know and love Jesus. He gave his whole heart to him, and not a day passes but he regularly prays. He has a

TROPICAL FRUITS FROM SINGAPORE: FROM A PHOTOGRAPH FURNISHED BY H. W. MINSON.

Bible, too, which he reads in English. On last Sabbath for the first time, he having asked to go to our church with me, went up, and, kneeling at the altar, commemorated with us the death and sufferings of Christ. How my heart rejoiced to see it! I brought the cup to him, and by faith I could see him, years hence, preaching Christ to his people, and giving the cup to them as I was then giving it to him. Let all who pray, ask God to bless this dear boy, and make him a blessing to his people.

May 13, 1889. R. W. MUNSON.
Singapore, Straits Settlement, East Indies.

Friend M., we are exceedingly obliged to you for the beautiful picture and the excellent photograph from which our people have succeeded in making so good an engraving. The picture and description fairly make one's mouth water. I think I should especially like that great big jack-fruit, for I almost always like any thing that anybody else does; and as they are God's gifts, I think it is our duty to be careful how we pass them by with careless indifference. If you had the arranging of the display, I don't quite see why you put in the bottle and glasses. But very likely somebody else who does not feel as you and I do did the arranging. You did not tell us about the beautiful ferns; but I suppose they were put in to set off the whole. I suppose it would not be possible to have these fruits shipped to us as they ship bananas, pine-apples, and cocoanuts, else we should have had them before this time. And now may God bless you in the work you allude to in your closing remarks. I was especially touched with the expression, "I have learned to love them dearly." Dear brother, that is the kind of spirit that wins souls. When we love humanity for Christ's sake, we are on the right path; yes, when we get where we can love even our enemies, the work is almost done; for, in the majority of cases, before we have loved them long they are enemies no longer. We say amen to your concluding sentence. May God bless not only that dear boy, but a thousand more, and raise him up to do the work that needs doing.

CUBA AND ITS HONEY RESOURCES.

OUR OLD FRIEND A. J. KING DISCUSSES SOME OF THE POSSIBILITIES OF DEVELOPMENT ON THIS ISLAND; AN INTERESTING LETTER.

OCCASIONAL letters of inquiry, and articles from time to time in your columns, relating to bee-keeping in Cuba, induce me to contribute a paper for the information of any who may be thinking of emigrating thither in order to better their condition as honey-producers or otherwise. To premise, I have visited the island three times, and, in the aggregate, spent more than a year in founding and operating apiaries, so that what I have to say is derived from experience rather than theory or second-hand information.

The island of Cuba, from its most eastern point to its western terminus, is about 700 miles long, and has an average breadth of about 66 miles. A range of mountains, occupying nearly a central position,

traverses its entire length, in miniature much resembling the backbone of a fish. In the eastern portion they attain a height of from 5000 to 6000 feet above sea-level. As they approach the west, they gradually diminish in height and abruptness, until within 300 miles of their western terminus they will average only from 1000 to 1500 feet high, and the declivities are so gentle that in many portions they admit of profitable cultivation over their entire surface. Numerous small streams, originating in these mountains, flow north and south to the sea, being often diverted from their courses by solitary peaks and ranges of hills, giving rise to numerous beautiful and highly fertile valleys, capable of supporting a dense population. While most of the coast-line is undulating, yet there are in some portions near the river-mouths quite extensive tracts of level lands, sometimes marshy. Considerable forests abound, especially on the eastern and southern declivities, and are, or should be, valuable on account of their fine hard woods. I obtained at one mill 19 varieties, cut in the immediate vicinity, embracing ebony, cedro, hookero, mahogany, and others equally valuable, but of names not easily pronounced. The proprietor was under contract to furnish a railroad company several hundred thousand ties, 5x8 inches square, and mostly mahogany. It seemed to me a pity that such magnificent timber, fit for the finest of cabinet work, should be used for such a purpose.

ITS VEGETATION.

Nearly all vegetables raised in the United States do fairly well here. Northern fruits are cultivated to a very limited extent on the higher portions of the island; but as a rule they are not well adapted to the climate. Tropical and semi-tropical fruits in great variety are plentiful in nearly all places, and at all seasons of the year, so that one does not greatly miss any thing in that line. Oranges, limes, lemons, etc., which in our own Florida require for their successful culture time, money, and knowledge, grow here in profusion with little or no attention.

The production of sugar, tobacco, and coffee, are the three leading industries depended on for money-making. Yet with a little American sagacity there are scores of other occupations which might be made equally remunerative, both in the agricultural and manufacturing line. A field of sugar-cane, once planted, is good for from 10 to 20 years without replanting, and the enriching of the soil by manuring is something I never yet have witnessed in Cuba. To give your readers a more concrete idea of the immense fertility of Cuba lands, it may be stated that, in 1878, over one-third of all the world's supply of sugar was produced on this island. Couple this with the fact that only a little more than one-fourth of the land is under cultivation, and only a portion of this devoted to cane-fields, and you begin to realize something of the future possibilities of this neglected country, should it ever come under the starry banner of Uncle Samuel.

I should like to speak of the romantic and beautiful scenery of mountain and valley; the caves and grottoes glistening in the torch light like millions of diamonds; the hillsides covered with royal palms (the queen of all trees); the splendid water, the general healthfulness of the climate, and a dozen other subjects of more or less importance; but as I am writing for a bee-paper I must forbear,

and devote the remainder of what I have to say, more in a "bee-line."

A. J. KING'S APIARIES.

On my first trip to Cuba I took 100 colonies of Italians, and located them near Havana; but as this apiary has been noticed in several back numbers of GLEANINGS, I refer the reader to those notices. The second apiary I located near Puerto Principe, about 500 miles east of Havana, starting with less than 20 stocks of Italians, and transferring native bees. They were increased to 400 stocks; but as I could not remain, and the help provided for their care being mostly native, and all inexperienced in modern bee-keeping, they have not prospered as they surely would have done under proper management. The third and fourth apiaries I established near Sagua la Grande, 180 miles east of Havana, on the headwaters of the Sagua River, midway between Toboca on the north and Cienfuegos on the south side of the island. One of these was fitted up on the best principles, and with all modern appliances, at a cost of over \$3000. It had just commenced to realize our most sanguine expectations, and would to-day, I believe, be the *finest apiary in the world*, had it not been for that

TERRIBLE CYCLONE

which last year devastated many parts of the island, and of which Sagua was the center. The hurricane, accompanied by a terrible downpour of water, continued with unabated fury for many hours, completely wrecking every thing in its course. Sagua alone, a place of 6000 inhabitants, suffered to the extent of 100 lives lost, and \$4,000,000 worth of property destroyed. The forests were wrecked. The water in the river backed up and covered large spaces never before inundated, and of course the new apiaries shared in the general ruin.

A WELL-EQUIPPED APIARY DESTROYED.

The main shed in our best apiary was 300 feet long, 12 feet wide, and 10 feet high. The posts were 10 inches in diameter, set 10 feet apart and $3\frac{1}{2}$ feet in the ground. The peak roof was well provided with rafters, and heavily thatched with the leaves of the fan palm, which extended down below the eaves to within four feet of the ground. The extracting-room, connected with one end of this shed, was a frame building 20 feet high, of fine proportions, and built in the most substantial manner. Throughout the length of this shed and extracting-room, and 500 feet further, down to the shipping-room on the river-bank, was a narrow-gauge railroad track, provided with low platform cars on which the long boxes of comb were carried to and from the apiary to the extracting-room and thence with their 1200-lb. tierces of honey to the shipping-room. Our extracting-room was provided with a receiving-pan of galvanized boiler iron, 14 feet long, 7 feet wide, and 14 inches deep, with large faucet at one end by which the honey was conveyed into the bungs of the tierces, with no dipping or lifting at all. The honey from the uncapping-table, after passing through a strainer, also emptied into this pan. The two-story hives, one foot apart, were placed just inside the line of the eaves of the sheds, and faced outward from each side, so that the sheds were comparatively free from bees, and were cool and invigorating, even in the hottest weather. The frames in the upper story came flush with the top of the hive, were covered with enameled cloth on which the flat cover fit closely, and were kept

from warping by two cleats, which also held them securely in place. By this arrangement the cover is never stuck fast, and the tops of the frames are always clean. The fact that, with an assistant, I have extracted 126 of these top stories in a single day, and replaced the combs, will give the reader some idea of the value of the most perfect appliances possible in our work. This apiary is rebuilding, and replenished under the direction of an American, although born in Cuba, and will doubtless speak for itself soon.

A. J. KING.

New York, August, 1889.

To be continued.

Why, friend King, what a grand place Cuba would be for gardening—no frost, no prolonged drouths, and, to crown it all, no need of fertilizers or manure! Why should she not furnish the world with sugar, or almost any thing else? I confess that I for one am greatly obliged to you for these interesting particulars. No wonder that Cuban honey can be sold at a low price.

H. R. BOARDMAN REVIEWS THE SEASON.

MIGRATORY BEE-KEEPING, AND ITS POSSIBILITIES.

I AM always quite anxious, at the close of the honey season, to compare notes with my neighbors; and especially is this so when I am short in my honey crop, as is the case again this year. If any one has a larger yield than I have, I want to know it and find out how he got it; accordingly, when the season closed and I had taken a long breath and a brief inventory of what had been accomplished in my own apiaries, I started out on a tour of inspection among my neighbors. I have been able to gain but the one consolation—that I am no worse off than my unfortunate neighbors, or, in other words, that my neighbors have done as poorly as I have. I found about the same condition everywhere I went. At every apiary I visited it was the same story of cold and wet weather in the fore part of the season; starvation at the critical time when breeding would have furnished bees for the harvest, and little or no surplus is the universal result. Where colonies were braced up by a little judicious feeding at the proper time, the extra care and expense of such feeding was liberally repaid, *as it always is*.

I was pleased to find in one instance an exception to this general poor condition of the apiaries. It was in the Bronson apiary of Mr. S. F. Newman, of Norwalk. You may remember that he reported quite a boom at that apiary last season on pea-vine clover, which is extensively raised in that locality. This apiary is again showing the advantages of location at particular seasons. I found the bees at this place doing good work in storing surplus, while they were almost entirely idle at other localities only a few miles distant. Mr. Newman was quite pleased over his good prospects, as well he might be.

This suggests the subject that was uppermost in my mind in my excursions, and about which beekeepers seem anxious at the present time to learn more.

MIGRATORY BEE-KEEPING.

Does it pay to move bees to catch the local honey-flow? and if so, how can we best make it pay? I

think it certainly does pay, if—and upon this it hinges the whole of migratory bee-keeping. If we could determine beforehand as to the resources of the different localities within our reach, so that we could have our workers at the desirable place in time for the honey-flow, then it would pay to move our bees to these best places rather than leave them in a poorer one.

Bee-keepers are beginning to realize, as they never have before, the value of location. The difference in the honey-flow of places only a few miles apart is sometimes astonishing. But it is important that we know of this difference before the honey-flow has demonstrated it, or else we are too late to take advantage of it. We can sometimes guess pretty close, and then, again, we might guess and get left. To illustrate: I decided this season to consolidate my apiaries as far as possible, in order to curtail expenses. Of course, I desired to abandon the poorest locations in favor of the best. Accordingly, I abandoned No. 2 and moved the bees, part to Berlin, which has always been my best location, and part to my home apiary. Hartland apiary I also proposed to abandon, and move the bees to the same yards, as it had always been my poorest location. But one thing crowded upon another until near the beginning of the honey season; and the prospects being so very discouraging, I changed my mind. Tiering up the colonies in this yard with empty combs, I left them to care for themselves, except an occasional visit to see how they were getting along. Now see how wisely I had planned: Hartland apiary proved the best location I had this season, and Berlin the poorest. That was the result of local showers, a cause entirely beyond human foresight.

Last season, in a trip out upon the prairie, ten or twelve miles distant, I discovered that the bees there were doing quite rapid work upon the extensive buckwheat fields raised in that locality, while the bees in my apiaries were entirely idle. I rushed home and prepared a load of bees, and moved them to this locality with as little delay as possible, for the bees there had been doing this good work already for about ten days. They were busy at work bringing in buckwheat honey in a few minutes after being released, as though they had known all about these prairie fields for a long time. In just one week I visited them again. The work they had done in those seven days surprised and delighted me. In preparing these bees to move, I shook them off the combs into hives with empty frames, with only starters, so they began anew without a cell of comb or a drop of honey, unless they were thoughtful enough to bring it with them. I found at this visit the hives averaging two-thirds full of most beautiful all worker comb, well stored. But here the work stopped. Cold and unfavorable weather came on, and continued until the bloom was past. Had I been able to place my bees there ten days earlier, and had favorable weather prevailed during the bloom, the result would have been very gratifying. As it was, I decided that the seven days' work that I did get paid me for moving. I felt quite enthusiastic over the result, and thought I saw some grand possibilities in the future of migratory bee-keeping. I decided to have my bees out upon those prairie fields the next season, and not be caught napping again. This was among the localities visited by me; but the prospect looked quite different from last season. The

usual amount of buckwheat had not been put out, and the locality offered no inducements for moving my bees there again. This season I was a little disappointed—yes, sir, I was; yet I shall endeavor to keep posted in the local prospects for a honey crop, and move my bees whenever I think it will pay to do so. Although I failed to discover any desirable fields to which I could profitably migrate with my bees, I did discover in the bee-yards of my neighbors quite a large-sized bone which I may take occasion to pick with them some time in the near future.

H. R. BOARDMAN.

East Townsend, Ohio, Aug. 1, 1889.

Friend B., you have given us some very valuable points. I am very glad to hear this testimony in favor of the peavine clover, for I feel sure that this clover is a fore-runner of prosperity in any locality, not only for the bee-keeper, but for the farmer; for whether he plows it under or whether he cures it for hay, he does a good thing, as a rule. I have long thought of just this very thing you mention in migratory bee-keeping; and, you may remember, in the A B C book I suggest planting colonies in different points throughout the country, to indicate what is going on. This fact will confront us, however, that one colony will do a pretty big thing where 40 or 50 will not. I think, however, it will pay the man who proposes to move his bees to catch the honey-flow, to test different points, say within ten miles or more of his home. I was also already aware that the locality that proves best one season may be the next just the other way. I did not know, however, that it was local rains that caused it. The crops a farmer may take a notion to raise may have a great deal to do with it, as in your case of the buckwheat. Why not have some land in a buckwheat region, or rent some land, or, if you choose, pay the farmers in that vicinity so much per acre for having them sow buckwheat rather than some other crop? Furnishing the seed will often turn the scale.

AMONG THE BEE-KEEPERS OF VERMONT.

A VISIT TO MR. HOLMES' APIARY AND OTHERS'.

THE next day, after visiting awhile, and enjoying this view, we were driven northward to the Cream Hill apiary of Mrs. Wolcott, of Shoreham, whose husband, now deceased, was a leading and successful bee-keeper. This apiary is now managed by Mr. R. H. Holmes, who has an apiary of his own in another part of the town. Here were 142 colonies in chaff hives, numbered and arranged in groups. The spring count was 122, and 300 lbs. of comb honey was secured. Here was the best and most convenient little honey-house and work-shop combined we have seen anywhere. It was 16 by 22 feet, one story and a half high, and clapboarded and painted. Below were two rooms, the honey-room occupying the south half and the work-room the remainder. The latter contained a stove, and was fitted with convenient work-benches. Above was a loft with one window in the south end, and connected with the work-room by convenient stairs.

Every thing seemed adapted to its purpose, and was neatly arranged. A good part of the crop was

in the honey-room, and was very fine. The shipping-cases here were marked in colors, and with the most tasty and attractive stencil designs we have seen.

The next apiary visited was that of B. W. Hall, a few miles away. He is a manly and gentlemanly young man, the son of a farmer. He keeps bees because there is money in it, and not from any special taste for it. He has 70 colonies in chaff hives, with *movable outer cases*. He had in spring 53 colonies, and obtained 2000 lbs. of honey, comb and extracted, the former in 2-lb. sections.

He has a honey-house similar to Mrs. Wolcott's, though larger. After being courteously entertained here we made a call on Miss M. A. Douglas, well known as the secretary of the Vermont Bee-keepers' Association, and a successful lady bee-keeper. Our time being limited, we were obliged to make a hurried call. This lady had in spring 29 colonies; increased to 34, and obtained 700 lbs. of honey in 2-lb. sections. Her comb honey was the finest exhibited at the Bay State Fair, held in Springfield, last fall, and was awarded first premium. She commenced in 1883, and finds she can do most of the work herself. When there is occasional lifting or heavy work she calls on one better fitted to do it.

We next visited the home yard of Mr. Holmes; but as he was away we were obliged to postpone our interview; and instead of continuing our journey by rail we availed ourself of friend Larrabee's hospitality another night. The next day both of us dined with Mr. Holmes, and inspected his apiary; and I must say that the finest and neatest prepared sections of comb honey we have seen were at this gentleman's place. In scraping sections he uses a narrow-handled pocket-knife, with the thick blade ground short and to a point. He is assisted in this work by his wife and daughters.

In the spring of 1888 he had 92 colonies; increased to 100, and obtained 2200 lbs. of comb honey in one-pound and half-pound sections, which are put on the market both glassed and in paper cartons. He uses the movable outer cases for winter, though somewhat different from those used by either Crane or Manum. He packs beneath the colony also. He uses the Langstroth size of frame, because on it bees are more salable. The hives are painted and numbered, and arranged in rows. Mr. Holmes was at one time in the employ of Mr. Crane, and partly follows his methods. He was formerly secretary of the Vermont Bee-keepers' Association, and is now its president. We found him well posted and thoroughly practical. An opinion expressed was first carefully weighed. He is a professing Christian, and, in our opinion, is a reliable man.

After a profitable call and very satisfactory dinner here, friend Larrabee took us to the train, where we took leave of him, hoping that we might have an opportunity to return his favors, and feeling that the bee-keeping world would hear from him in the future. This winter he was elected secretary of the Vermont Bee-keepers' Association, Miss Douglas having resigned. We would whisper aside, and in confidence to our friends, that, though John is very kind and friendly, his hair is inclined to be sandy, and it won't do to pull it roughly.

Our next stop was with Mr. N. V. Forbes, a bee-keeping farmer in West Haven. Having a good location he has done well, and thinks some of renting his land and attending to the bees. He had 75 colonies, and a crop of 2000 lbs. of comb honey as the

season's results. In 1887, from 80 colonies in two yards he obtained 6000 lbs.; and in 1886, 80 lbs. per colony. Mr. Forbes kindly took us to visit Mr. Eugene Lee, of Benson, a neighboring bee-keeper, and quite an extensive dairy farmer. Among those bee-keepers we could not visit were V. V. Blackmer, of Orwell; H. L. Leonard, of Brandon; W. H. Proctor, Fair Haven, and many others.

Mr. Blackmer, a bee-keeper of ten years, has 100 colonies, which have paid their way from a small commencement. Mr. Leonard has 100 colonies. Some of the bee-keepers in the region have become well off through their bees.

Pawtucket, R. I.

SAMUEL CUSHMAN.

To be continued.

INTRODUCING.

A METHOD OF INTRODUCING QUEENS TO FULL COLONIES, WITHOUT REMOVING A COMB OR EVEN OPENING THE HIVE.

THESE are many novices and others interested in bees who would buy a queen of a given race or strain if they could only introduce them in a simple and sure manner without opening the hive after dequeening it. Then there are the box-hive people and those careless people who allow their bees to build crosswise on the hanging frames, all of whom would buy queens if they could be introduced with safety. There are many who are afraid of their bees, and hardly dare open the hives at all. A man wrote me recently, saying, "I want a queen of your strain, but, to tell the truth, I dare not introduce her. My bees are very cross."

My method of accomplishing this end is as follows: On the day the queen arrives, or before, go to the hive where you wish to introduce her and dequeen it, either by drumming out or removing the frames. Adjust a small box-feeder, that can be closed tight to the top of the hive, directly over the combs, and so arranged that the bees can enter the feeder directly from the brood. Give them about a pint of thin syrup; close the hive and leave it for 24 hours in this queenless condition.

On the next day, about 4 o'clock, go to them with the queen that was received the day before, and, after turning in more of the feed, place the cage on the float, so arranged that all the bees can cluster over the screen-cloth on the cage, and "get acquainted with her majesty," as Mr. Root terms it. I do this so that the new queen, cage, and attendants, may absorb the same odor as the hive, rather than for acquaintance' sake, which I think is a more correct way of putting it.

After you make sure that the cage is above water, and will remain there, and that you have left plenty of room for the bees to pass over the cage, close the hive, and leave them until about 9 o'clock the next morning, when you will go to them again, remove the cage, and turn back the wire cloth at the provision end far enough to allow the queen to pass. Plug this entrance full of candy; pour a little syrup into the feeder, place the cage back on to the float, and close the hive. Do not open again for a week.

The above is almost infallible. I have used it two seasons successfully. I have allowed queens to leave cages after the first 24 hours, with success.

If robbing is rife, do all feeding at sundown, and do not release the queen until after 4 o'clock. For

introducing by this method to a hive which has just cast a swarm, precaution must be taken that I will not state here. The feeding drives the old bees to the field with a rush. Old bees are enemies to strange queens. Queens can be kept for several days without injury, by placing them, as shipped, in a small light-proof box in any dry cool place. I always keep mine in the honey-house on a shelf near a small window. During cool weather, take the box into the kitchen. I never feed queens honey while in confinement. It does more harm than good.

I do not introduce by the Peet method of attaching to the comb and removing slide—it is too fussy, amounts to nothing, and is fatal to the queen, in the hands of a novice. I am using the Peet cage, though I do not like it. It is expensive in every sense of the word.

E. L. PRATT.

Marlboro, Mass.

Friend P., while we publish your plan of introducing we want to protest a little in regard to the heading which you put on the article. Drumming out bees to get the queens is not a new method, but one so old that it was in use before movable combs were known; neither is feeding a colony to make them good-natured new; and I do not see very well how we are going to do this feeding without opening the hive. It is true, you may put the feeder on top of the hive, but then you must make an opening in the top board and have some sort of cap or box over the feeder.

In regard to the Peet method, I presume that I am the one who first suggested selling queens at the low price of one dollar each; and I think that, without question, during the past ten years we have sent out more queens by mail than any other one person—perhaps more than all of the rest of the world together. In fact, during all the spring, fall, and summer months, the queens are constantly on our table, ready to be mailed by the first train, to any one who wants them, south, north, east, or west. As a matter of course, it has been of the utmost moment to us to select some method, not only of sending queens by mail, but some plan that would permit our patrons to introduce them with the least possible risk. Well, after having tried so many different plans that everybody began to get out of patience, to say nothing of the expense of such experiments, we finally settled down on the Peet cage. We have used this cage for years, and I am firmly satisfied that, for a feeble queen (and they are generally more or less weakened by a long trip through the mails), there is no other plan to be compared with letting the queen right on the comb in the hive, and letting her help herself to the honey in the cells, at the same time having her in the center of the brood-nest, her natural and proper place. Queens get discouraged, dejected, and ready to die. I have oftentimes thought that they get homesick, just as we mortals do. Well, now, can any thing revive her drooping spirits, and make her feel as if she were once more at home among the loved ones, like being on a honey-comb, in the center of a hive? I do not believe on a float in a feeder. The feeding part is all

right. During a dearth of honey in the fall, a good heavy feed will contribute very greatly toward putting the bees all in a friendly and amicable mood, provided you do not get robbing started. I have replied thus at length, because of late there seems to be a fresh interest starting up in this matter of introducing.

HONEY IS DIGESTED NECTAR.

Shall the Great Big School of Humanity be
Taught the Truth, or shall We Now and
Then Keep the Truth from Them?

PROFESSOR COOK FINDS A LITTLE FAULT.

OUR friend Demaree has now a recruit—a doctor. This doctor—see last *American Bee Journal*—makes several assertions that just a little knowledge of chemistry would have prevented. Is it possible that our "M. D.'s" know nothing of chemistry? Such articles may possibly be excused in a lawyer, but from a doctor they are certainly indefensible. Even a lawyer should not attempt to enlighten the public on what he knows nothing about. His ignorance may be excusable; his misrepresentation and pose as a teacher are never venial. To say that nectar and honey are the same, or that sugar syrup fed to bees is identical with the honey placed in the combs, is to show entire ignorance of the subject. It is too bad that such men will write. Now, Mr. Editor, why do not you editors get a little blue litmus paper and a little copper sulphate, or, better, Fehling's solution, and prove for yourselves the truth of this matter? Then when such articles are sent in, throw them into the waste-basket. You would not insert an article about the king-bee. To say that honey and nectar are the same, is as absurd as to say that there is a king-bee.

Again, it is urged that calling honey digested nectar is revolting, and will injure the sale of this delightful sweet. This is fear with no cause to stand on. Honey is good, and *will be eaten*. Almost all our green peas are wormy. People know it, but they eat peas, and will so long as they are so good. To the uninitiated, the idea of eating oysters would be revolting. Here the animal is eaten entire, with the digestive canal and its entire contents. Yet oysters are good, and will be eaten *in extenso*, so long as the quality remains, and men have a taste for good food. So it will be with oysters. Truth and honesty are always the best policy. Better "tell the truth and shame the devil" than to preach lies and delight him, even though we could sell a little more honey.

VIRGIN'S BOWER.

Our friend Geo. E. Hilton sends me the following letter: "The inclosed flowers are from a plant that grows abundantly here in the swamps. It clings to bushes which it often entirely covers, and is a great favorite with the bees. In watching closely to-day I could see no pollen. As you will remember, I had a sample of the honey at Detroit. What is it?"

This is the beautiful "virgin's bower," *Clematis Virginiana*. It is not strange that Mr. Hilton did not see any pollen. This plant is dioecious; that is, the stamens bearing the pollen are on one plant, while the pistils which are to receive the pollen are on another. In such cases the flowers must secrete nectar to exist, as bees or other sweet-loving insects

must act as the so-called "marriage-priest." We have only to know the structure of such plants, to know that they are honey-plants. We may be glad that this clematis is a honey-plant, as it, like the goldenrod, willow herb, and clover, is exceedingly beautiful.

SPRAYING AND POISONING BEES.

Do not think me over-sensitive. I am sure I am not. I do not believe I have a morbidly sensitive hair in my capillary covering; but when I say that I was dumbfounded to read Mr. Alley's censure, in the last *Apiculturist*, of my earnest endeavor to inform all the people of the wrong and evil of spraying fruit-trees while yet in blossom, is to put it mildly. Think of an American, in the nineteenth century, and a Massachusetts man at that, urging against giving information on an important practical question because, forsooth, some person might make use of this information to work evil! Mr. Alley says I have informed the people how they may destroy bees; and thus the enemies of bee-keepers will have opportunity, and will use this opportunity to injure those whom they dislike. This is certainly a sorry opinion of our people. I believe it is a wholly unwarranted suspicion. The truth that it is dangerous and wrong, and utterly unnecessary to spray fruit-trees with poisons while the blossoms are still on, should be sown broadcast. Every fruit-grower should know and keenly appreciate the fact that, to poison the nectar in the blossoms, is to injure both his neighbor bee-keeper and also himself. He needs the work of the bees no less than does the apiarist. I would have laws enacted against this early spraying, and make the punishment both fine and imprisonment. Not that this is necessary to secure against the evil, but it would be a very rapid educator. I believe it is very important that bee-keepers take all pains to make the truth in this generally known. If people know the consequences, they will practice the correct method.

Agricultural College, Mich.

A. J. Cook.

Friend Cook, as a rule we prefer not to publish any thing criticising other journals or writers of other journals; but we trust that our good friends of the *American Bee Journal* and the *Apiculturist* will excuse us this time, especially as it comes from Prof. Cook, and as you give us so much truth. One little remark you let drop caused me to smile; viz., "Almost all our green peas are wormy." Some time ago my sister informed me that the peas we were selling had little worms in them that could be seen with a magnifying-glass. These worms are doubtless the larvæ of the pea-weevil. Of course, the peas planted contain no weevil, because we get them from northern localities where the weevil has as yet been unknown. Now, the question came up, "Shall we sell peas to people, knowing that the peas contain little worms that could be found with a magnifying-glass?" I said at once just as you say. If the peas are good, and no one can possibly discover by the taste the presence of these embryo weevil, without the aid of a magnifying-glass, I would certainly pay no attention to them. In fact, there is such a thing as making one's self disagreeable by being over-fastidious. At one time our folks in charge of the lunch-room informed me that there were worms in the rice. I suggested that it was probably near

the mouth of the bag, and that they could easily be removed. Then we could heat the remainder of the rice in the oven until all the germs were killed. Some of the boarders found it out, however, and there was going to be quite a breeze because we used articles for food that should be thrown to the chickens or into the compost-heap. Now, I have no doubt that good food has been thoughtlessly thrown away because of a certain foolish notion that nothing should ever be used where the worms have been found in it, even near the mouth of the bag. I attempted a little remonstrance; but public opinion was against me. In a few days after that, we had some high-priced chestnuts. Somebody found a *wormy chestnut*; whereupon I suggested that the whole bagful, which cost between five and ten dollars, be given to the pigs. They opened their eyes in astonishment. Wormy chestnuts and wormy apples are so very common that folks are used to them; and even if the worms should get into your mouth, there is no need of fainting away or of sending for a doctor. Now, I heartily agree with friend Cook. If people will refuse to eat honey because we teach that it is taken in at the mouth of the bee, and then thrown up in the same way, when it is put into the honey-cells, let them refuse; and the same way with green peas or with oysters; and I think exactly the same way about the dissemination of information in regard to spraying fruit-trees. I am sure that I have no neighbors, or, rather, no enemies, that would willingly poison my bees; and when it becomes necessary for me to keep the community in the dark, or in ignorance, I shall have a poorer opinion of my fellow-men than I now have. It is this same ignorance that has caused the foolish and wide-spread belief that comb honey is manufactured.

MORE ABOUT THAT INTERESTING EXPERIMENT.

FURTHER FACTS UPON HOW IT WAS DONE.

IN answer to the queries which you raise in GLEANINGS, p. 618, I will say it is true that I commenced June 7 with a single colony and its swarm, each of which contained nine frames. I divided the said colony, six days after it swarmed, into three colonies, and I also made one out of the swarm shortly after the brood was sealed, by taking the queen and the three frames which had the least brood, and a small share of the bees, leaving the remaining six frames ten days longer to make queen-cells, when I divided it again, making use of all the queen-cells. This made six colonies, so that I had not less than three frames in any of them. This brought me to the 27th of June. About the 5th of July I made three more colonies from the six, making nine in all.

You say you presume I did not get any brood from other colonies. No, not an egg nor a queen-cell, nor any stimulation whatever, other than the sugar I fed them, for that is what I set out to do, as I stated in the beginning of my report; viz., to compel them to draw out their own combs, lay their own eggs, build their own queen-cells, and hatch their own queens; and I did so.

I should have said in my report, that I had no other colony than the one in question, save one; for that spring, and the spring preceding, I sold my bees, keeping but two—one for honey, for family use, and one to experiment upon. Of late years I keep bees only for the love of them, and for the enjoyment of sitting under the cherry-trees and watching them at their work. The above, I presume, is an answer to your last query, viz., if I kept any account of my time. I can only say that there was no time lost; but if it must be considered lost, I can say that I enjoy that loss more than I do the profit (however great) or the employment of my time. I may say that I am an invalid, entered upon my 73d year, and am very feeble—more so than some in this vicinity 15 or 20 years older. Of course, then, my time would be of little consequence.

Whigville, O., Aug. 7, 1889

HENRY LARGE.

Many thanks, friend L. Your further facts remind me of my strawberry story in another column.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

HALF DRONE AND HALF WORKER.

I mail you to-day some Italian bees from a fine select tested queen reared this season. Five of the bees have heads and shoulders like drones, and abdomens like workers. They also have stings; and as soon as they hatch they crawl out of the hive on to the ground. All of the bees are fine yellow, three and four banded, except a few of the queer ones, which are black, like the one in the cage. This is the first queen that I ever raised that produced half worker and half drones, as I call them. As I do not recollect of seeing any account of such strange bees, I should like you to explain through GLEANINGS what they are, and whether you think there is any black blood in the queen by some of the queer bees being black. My bees have done very well this year.

C. F. GRUBB.

Jubilee, N. C., July 29, 1889.

Half drone and half workers have been noticed a great many times, and have frequently been mentioned. It is nothing more, I believe, than a freak of nature, or a malformation.

THAT NEW BEE DISEASE IN CALIFORNIA: LATER DEVELOPMENTS.

I am happy to say that the plague, of which I wrote, see page 583, is now apparently subsiding; and bees that have survived seem to be rapidly recuperating. Losses in the apiaries under my immediate control amount to about 250 stands—enough to make one feel decidedly sick, and to test thoroughly the virtue in man for which our ancient friend Job was celebrated. I am negotiating, with the view to acquiring new stock, should indications continue favorable. A feature of the disease is, that in all cases it doesn't prove fatal. A number of colonies that were badly affected last season have pulled through, and are strong and prosperous now. The same might be said of this season. I also put new colonies upon combs and honey from diseased hives of last season, many of which are in good condition to-day. I learn from an old resident, that this is the third time bees have died in large numbers here within twenty years. Whether it

has affected other localities, I am not as yet able to learn. Why we should be thus afflicted is at present mysterious. While in the coast counties foul brood is common, none has ever been seen in Kern Co. We are a dry county, and depend entirely upon irrigation. The average rainfall is about 4 inches per annum. The honey crop will not be over 50 per cent of the average yield this season.

ALFALFA.

In your comments on friend Burr's letter you ask for information in regard to alfalfa. My opinion is, that, as a honey-plant in the States, it would have little value, for the reason that it appears to secrete honey only under the most favorable conditions of dry heat, and only in the middle of the day; that is, no doubt, the reason why so many doubt its value as a honey plant. With us it is the foundation and superstructure of the honey yield. We have several plants and willows which build up the bees in spring, but alfalfa is the backbone of the crop.

W. A. WEBSTER.

Bakersfield, Cal., July 25, 1889.

CARNIOLANS' EXCESSIVE SWARMERS.

Since writing our article on Carniolans, we have noticed the following in regard to them, which we take from the *British Bee Journal*, page 309:

There were some remarks lately about these bees, and I must corroborate what is mentioned; and so far as I am concerned they are nothing less than a nuisance, owing to the way they swarm. I got a nucleus last year, from a good source, a well-known party in the B. B. J., and I now wish I had let them alone. Let me give you the result. First swarm came off about a month ago. I then changed stock to a new stand, and put swarm on the old one. Second swarm came out of the old stock about a fortnight after, and up to the present the first swarm has thrown three swarms, good-sized ones too, and I can not get them to work on the sections, though I had them on all the swarming time. My hives are all standards. What is to be done with them? No doubt they are good breeders, but what good is that if it is honey you want and not bees? Up to the present I find no bees working as well in the sections as they ought and have done other years. I wish others would give their experience of the Carniolans.—H. J.

TOP-BARS, ABOVE WHICH NO BURR-COMBS WILL BE BUILT.

In answer to the inquiry concerning the modification of the top-bar of the frame to prevent burr-comb, I will say that it can be done. In 1888 I made a number of frames having top-bars $\frac{3}{4}$ inches square, and spaced them $\frac{3}{4}$ inches apart in the hive. There has been no burr-comb built on them thus far (two years), though other frames immediately alongside of them had them. I have tried them with honey-board and without.

TO GET THE TOP ROW OF CELLS IN SECTIONS CAPPED.

C. F. McColm can get the top row of cells capped over by tiering up and not leaving a bee-space between the sections, and then crowding the bees; but they will likely build them against the separators, so that his sections will drip badly. Such has been my experience.

TOBACCO PLEDGE

I quit using tobacco about a year ago, after reading GLEANINGS. If I am entitled to a smoker, send it along. I will pay for it if I begin again.

Lewisburg, Pa., Aug. 6, 1889. W. C. MAUSER.

May God bless you, friend M., in holding on to your tobacco pledge. No honey report gives me such a thrill of pleasure as does the

news that another friend has given up tobacco, washed his hands (and his mouth), and taken a step a little higher up among clean, pure people, even though it has cost something to say, "Get thee behind me, Satan."

RECIPE FOR RAISING SPIDER-PLANTS.

Feed the seed to your poultry. Clean out the fowl-house and sow the contents on the borders, and you will probably have an unlimited supply of strong plants. I have never sown a seed except the first packet I got from you. My fowls are fond of the seed, and help themselves from the plants. I could supply hundreds of plants any time all the year round. It grows here equally well, both in summer and winter time. I have always some plants in bloom. The bees are particularly fond of playing about it; but so far as I can make out, they do not get a large quantity of honey from it. This has been an exceedingly poor season for honey all over Australia.

IGNOTUM TOMATO.

I duly received the packet of Ignotum tomato seed from you. I planted them and got a beautiful row of plants, just ready for transplanting, when a most wretched goose got into the garden and nipped off every solitary head of the Ignotum close to the ground, although there were hundreds of the commoner sorts she might have feasted on. Will you oblige me with another packet of seed, of which I certainly will take greater care?

ÆNEAS WALKER.

Redland Bay, Queensland, Aus., May 13, 1889.

Well done, friend W. I am provoked almost every season by failing to get spider-plants in our greenhouses or hot-beds; but a little later on, when the weather is warm, they come up with astonishing rapidity among the weeds in different parts of our grounds, where they were cultivated perhaps years before; and of late we have sort o' given up, and depended for what we raise for our honey-garden, on the chance of picking them up. The consequence is, we do not get any bloom before August. It seems a little singular how many mishaps like the one you mention occur with the Ignotum tomato-plants. We always keep seed on hand to replace that destroyed by such mishaps.

TOP BARS $\frac{3}{4}$ IN. SQUARE, AND NO BURR-COMBS.

In corroboration of the experience of A. L. Kil-dow, given on page 632 of GLEANINGS, I wish to say that I am never troubled with burr-combs between brood-frames and sections. The top-bar of my brood-frames is $\frac{3}{4}$ of an inch wide by $\frac{3}{4}$ thick, and there are ten of them in a hive 13 inches wide. The sections are raised $\frac{1}{8}$ of an inch from the top-bar, with no honey-board between, and I have never yet found any brood in the sections. I can see no use in compelling bees to squeeze through a perforated honey-board in order to reach the sections.

¹ Pontiac, Mich., Aug. 10, 1889. F. N. HILTON.

The fact you give is valuable—the more so as it confirms the former statements of others. Who else can give corroborating testimony?

AN EVER-BEARING STRAWBERRY.

In our advertising pages will be seen an advertisement headed as above, coming

from one of our friends in Oregon. At the very low price they are offered, you can well afford to try a few and see if they will bear the year round in your localities. I believe there has never been an ever bearing strawberry that obtained much favor; but even if it does not bear very many berries, many of our strawberry amateurs may like to test it, and possibly keep a few. Here is what our friend says about it:

Our strawberry patch of about one acre is now bearing fine large berries, and we have now on our peddling wagon, which goes to the Portland market in the morning, over one hundred pounds of strawberries, which retail at two bits a pound. They bear from frost to frost. For our responsibility, see our record.

SETH WINQUIST.

Mount Tabor, Oregon, Aug. 14, 1889.

We also give below a clipping from the Portland *Vindicator*, of August 8:

FINE STRAWBERRIES.

Seth Winquist, of Mount Tabor, called at *The Vindicator* office Saturday morning and left a sample box of delicious strawberries just picked from his garden. He brought in over 100 boxes for the market, and finds ready sale at twenty-five cents per box. It seems incredible that strawberries should be raised and sold in the market at this season of the year; but it is nevertheless true, and they are of a fine quality too. Mr. Winquist informs us that his is a continuous-bearing variety of plant, and has been bearing berries from early in the spring, and will continue until late in the fall. During this unusually dry season the plants in Mr. Winquist's garden do not yield largely, but from a patch of an acre he informs us he gathers some 400 boxes per week. These he has been able to dispose of at twenty-five cents a box—a gross revenue of \$100 per week for one acre of land. Who said there was nothing in raising strawberries in Oregon?

WHITE CLOVER VS. THE BUSH HONEY OF AUSTRALIA.

We extract the following from the Australasian *Bee Journal* of July 1, page 5:

White-clover honey is undoubtedly the best, both for consumption and as a marketable article. In fact, the difference between clover and bush honey is as great as could possibly be imagined. That from clover is of a delicate, smooth, and enticing flavor, which does not pall on the palate, whilst the color is a rich amber, and the granules very fine. On the other hand, most bush honeys have an extremely strong, coarse flavor, leaving a disagreeable after-taste in the palate. There are, however, one or two bush honeys that are not so objectionable, but still even these are a long way inferior to white-clover honey. The greatest difference also exists with regard to color, that of the latter being very superior. The granules of bush honey are usually very coarse, and like the granules of coarse sugar. Perhaps the point most concerning bee keepers is, that clover honey will always meet with a more ready sale and command a higher price in the market.

POISONOUS INSECTS AND SNAKES OF FLORIDA; INFORMATION WANTED.

In the issue of Aug. 1st, p. 629, our good friend Prof. Cook thanks GLEANINGS for having obtained through it a fine specimen of a copperhead snake, and would like to have other Southern snakes. I plead for this little space in GLEANINGS to recall this notice, and remind our Florida friends who read GLEANINGS, that, when they are sending Prof. Cook snakes, to be sure to send him a black "grampus," the sting of which is said to be very fatal, so we can have it described in GLEANINGS; or if Prof. Cook is acquainted with this insect, he will confer a great favor on us who anticipate going to Florida, if he will give us a description of it. It will be very

interesting to have him tell us about the Southern snakes, and I hope our Southern friends will avail themselves of this opportunity. I saw some snakes in Florida that would break short off when struck with a stick, the piece with the head going on as if not hurt. I was told they would grow out again if not broken too near the middle. I have seen the ground-rattler and the coach-whip. The former is said to be very poisonous; the latter is a very saucy fellow.

JAMES W. WALKER.

Green Spring, West Va., Aug. 18, 1889.

We second your request, friend W. By all means let us know all about these noxious insects and reptiles. I should especially like to have Prof. Cook tell us about the snake that breaks in two when struck with a stick. Does it break in two without the shedding of blood?

CELLAR WINTERING COMPARED WITH OUTDOOR WINTERING; ARE THE LATTER MORE HARDY?

I want to ask a question. Are bees that are wintered in a cellar, or are buried, or kept in any other similar way, more liable to spring dwindling than bees that are wintered in chaff hives? I have kept from 10 to 75 colonies of bees for 15 years. Part of my bees I have wintered by burying them, and a few colonies I keep in chaff hives. I find no difficulty in wintering my bees by burying them. They winter equally well in chaff hives, and even better. The bees that I bury seem to be more liable to dwindle after I remove them from the ground in the spring than the bees in chaff hives. But it should be borne in mind that my chaff hives are not like the ordinary chaff hives in use. I have two styles. The style I like best has the brood-chamber 10 inches square in breadth, and 24 inches in depth, containing 2000 cubic inches inside of the frames; 7 tall narrow frames to a hive only. With this chaff hive I have wintered my bees, not finding on the bottom-board during the whole winter and spring over one-eighth or one-fourth of a gill of dead bees. This is not as many as would apparently naturally die from old age. I found on the ground, outside of the hive, scarcely more than 25, 50, or so dead bees, and no spring dwindling.

WILLISTON CONNOR.

Rensselaerville, Albany Co., N. Y., Aug. 12, 1889.

We think, as a general thing bees are less liable to spring dwindle in chaff hives on summer stands. Beginners, as a rule, will have better success with the outdoor plan; but experts, while they will have no better results, will winter with less stores per colony in the cellar.

In addition to what Ernest says, I wish to add that one great reason why I abandoned wintering in the cellar or wintering in a house with sawdust walls, was because of what you mention. I could winter the bees very well either way; but the trouble was to get them through April and May. In the chaff hives we have no such trouble to speak of, while indoor wintering always troubled us more or less.

FALSEHOODS IN CYCLOPEDIAS: A PLEA FOR THE BRITANNICA.

I have noticed the frequent justly indignant protests in GLEANINGS in regard to the foolish story about the manufacture of artificial comb and honey with paraffine and glucose. But it is not a just charge against the *Encyclopædia Britannica* that the

article referred to is there published. The article on bees in that work was written by John Hunter, secretary of the British Bee-Keepers' Association, and, of course, is free from this sort of foolishness. I have carefully searched through the volumes, and find no reference in any place to this false allegation; the only mention of glucose in this connection being that it is sometimes used as an adulterant of honey, which statement is, unfortunately, beyond doubt, true in some instances. The fact that a cheap American reprint of the genuine encyclopedia contains the libel and slander is an instance of the common error of purchasing or reading cheap books in which cheap popular science, so called, is retailed by cheap writers. Like a mud spot on a bright surface, this slander will remain in perpetuity, no doubt, and as a proof that the adage, "truth will prevail," does not apply to present circumstances, under which truth has no chance against the persistence of a lie once gaining wide circulation. Possibly if the lie were left unnoticed it might remain in oblivion.

I have frequently referred to this matter in the *New York Times* as a foolish libel on bee-keepers, a class of men who are specially free from tricks in trade and such like meanness.

H. STEWART.

Highlands, N. C., Aug. 14, 1889.

We are exceedingly glad to hear that the genuine original *Britannica* does not contain this slanderous falsehood. The whole thing is a sad reflection on the American people in two ways, and every new newspaper statement in regard to the matter is a disgrace to us as a people.

WHEN TO EXTRACT; HONEY RIPENED BY BEES SUPERIOR.

I arranged four hives for extracted honey. During basswood bloom all of them filled the upper stories, but only one was completely capped over, the others not being more than half. Now, were the four ripe enough to be extracted, or only the one that was fully capped over? The honey was all gathered in the same ten days. From reading your works I should say no; but common sense might suggest yes.

ALFRED J. LAMB.

Jefferson, Ia., Aug. 11, 1889.

It is generally better to wait till most of the honey is capped over before extracting. Some bee-keepers extract before and ripen the honey in large open tanks. We never yet tasted artificially ripened honey that we thought was fully equal to that ripened by the bees, although some of the former is very nice. If you wish to get nice thick honey of extra quality, leave the combs of sealed honey on the hives through the summer, and then extract.

CLIPPED QUEENS A FAILURE.

I should like to ask if you ever had any trouble with your clipped queens in failing to issue with the swarm, or getting them killed by the bees. I have lost 30 out of 40 queens this spring. Two-thirds of my queens failed to issue with the swarm. I had three colonies swarm twice in succession without their queen, and so they became demoralized. I have almost concluded to stop clipping my queens.

Brackettville, Tex.

R. HEYMAN.

Years ago we had some trouble by losing queens, but we had no such proportion of loss as you have had. See Question-Box department for this issue.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

HONEY-DEW, AGAIN.

Bees are storing honey very fast from honey-dew. It is so plentiful that it is dripping from the tops of the tall timber, down on leaves of the underbrush.
Garfield, Ark., July 27, 1889. G. W. REDDICK.

THE CHAPMAN HONEY-PLANT.

My Chapman honey-plant has just ceased to bloom. It bloomed about one month, and the bees were busy on it from before sunrise till after sunset during the whole time it lasted. I have seen ten bees at a time on a single pod.

T. K. MASSIE.

Concord Church, W. Va., Aug. 17, 1889.

ICE-MAKING AND BEE-KEEPING COMBINED.

I am rushed with the ice-business just now. We are turning out, every 24 hours, from 66,000 to 69,000 pounds of bright clear ice. I have a poor chance to attend to bees and ice, both booming in hot weather.

THOS. D. LEWIS.

Knoxville, Tenn., Aug. 12, 1889.

SHALL WE UNDERTAKE TO REGULATE THE SUPPLY OF POLLEN IN THE HIVES?

There is a question in regard to pollen which I should like to ask. Should colonies be allowed to regulate their own supplies of pollen, or is there any rule to be governed by? EDWARD HOLLING.

Henrietta, Mich., Aug. 6, 1889.

[In our locality we never have an excess of pollen, therefore nothing need be done in regard to it. In fact, in the early spring we often feed large quantities of rye flour as a substitute for pollen.]

BEE-STINGS NO RELIEF FOR RHEUMATISM.

I have seen so many letters in GLEANINGS about bee-stings being a remedy for rheumatism, I thought I would add my mite. I have suffered with that disease for three years, and have handled bees every season, and this summer I was badly stung while hiving a swarm, and I am sure I never got any relief from the stings.

MRS. JOHN BURR.

Braceville, Ill., July 24, 1889.

[I am exceedingly glad to have you give us this adverse report. To get at the truth of any matter, we want reports of failures as well as of success.]

HONEY STATISTICS FOR MICHIGAN.

I send you the following figures, taken from the "Farm Statistics of Michigan," collected by the supervisors, and just issued: There were, in the spring of 1888, 4080 apiaries, containing 44,326 colonies; 52,199 colonies in the year 1887 produced 579,820 lbs. of comb honey, and 19,814 colonies produced 150,019 lbs. of extracted honey, and 8567 lbs. of wax were produced the same year; 21,847 colonies died in the winter of 1887.

F. N. HILTON.

Pontiac, Mich., Aug. 17, 1889.

SILVERHULL VERSUS THE JAPANESE BUCKWHEAT FOR HONEY.

I have just come in from the buckwheat patch. The bees are on the silverhull in goodly numbers, while the Japanese is almost ready for the sickle, and nary a bee to be found in all the patch. My bees have not done much toward swarming—only

10 swarms from all my stands, and not much honey. It has been wet and too cool for bees to work.

Atwood, Ill., Aug. 13, 1889.

J. W. C. GRAY.

BEEES ATTACKING SOUND FRUIT.

I desire some information. On my farm, all the early peach-trees had fruit which decayed on the branches. The bees then attacked this fruit and afterward went for the sound fruit that matured without decaying. I can't account for it. My bees are doing nicely, and my apiary is ten miles east of this city.

A. O. BRUMMIL.

Washington, D. C., July 18, 1889.

[You will get exactly the information you wish on page 682, Sept. 1, 1888, issue. I then made some careful experiments with bees on early peaches, and, I think, proved conclusively that the bees do not, and, in fact, apparently can not, cut into a peach until it begins to decay.]

CATNIP; WILL IT PAY TO PLANT IT?

White clover, with us, comes about the 25th of May, and lasts until the first of July; and then we have but little honey until buckwheat, which comes about the middle of August. Would it not pay to plant catnip on our farm, for it lasts about three weeks in July?

SHERMAN BORDEN.

Burlington, N. J., July 30, 1889.

[We think we can pretty safely say that it will not pay to cultivate catnip or any other plant for honey alone. Many experiments have been tried, from an acre up to several acres; but no experimenter has been sufficiently well satisfied with the result to keep it up. Buckwheat, alsike and peavine clover, are all right; also rape in some localities, as the seed is saved for oil.]

REPORTS ENCOURAGING.

A CONTINUOUS HONEY-FLOW.

The bees have not let up since the apple-trees bloomed in April, and there is a prospect for good picking for the next two months.

JOHN LONG.

Vesta, Ind., Aug. 15, 1889.

BEST SEASON FOR BEES EVER EXPERIENCED.

We are having the finest season for the bees I ever experienced. Basswood and clover were both splendid, and now the bees are booming on buckwheat and fall flowers.

J. C. HAND.

Abbot, Ia., Aug. 12, 1889.

LARGE HIVES; 51 BARRELS, OF 550 LBS., FROM 245 COLONIES.

My crop of white-clover extracted honey is very large, and of the very finest quality. I gathered 51 barrels, of 550 lbs. each, from 245 colonies, spring count. So much for large hives and a favorable season.

EMIL J. BAXTER.

Nauvoo, Ill., Aug. 8, 1889.

24,127 LBS. OF HONEY FROM 325 COLONIES, SPRING COUNT, AND INCREASED TO 402.

I received the extractor to-day. I did not get to try it this year, as I finished extracting to-day. I have taken out 24,127 lbs. of honey, and 720 of wax. How is that for 325 colonies, spring count? I increased to 402, with only \$38.00 paid for help.

Rush Point, La., Aug. 10, 1889. WM. J. DAWSON.

250 LBS. OF HONEY IN 15 DAYS, FROM ONE COLONY, AND 400 COLONIES IN ONE MILE SQUARE.

I had one hive of bees this year that gained 250 lbs. in 15 days from July 11th to 25th. I extracted in this time 234 lbs.; average daily, 16²/₃ lbs. I have

112 colonies, and there are over 300 more within one mile of my bees, making over 400 in an area of one mile square. All are doing well. F. B. JONES.

Howard, Minn., Aug. 6, 1889.

21,000 LBS. FROM 160, SPRING COUNT.

Our bees did quite well this season, considering the help I had, and condition of the bees in the spring. We had to buy sugar, and feed, so they were not strong. We had 160 colonies in the spring, and now have 250 colonies. We have taken off 21,000 lbs. of honey—1500 lbs. of comb honey, and the rest extracted. Our honey is very nice, all as good as you saw when you were here.

MRS. W. J. PICKARD.

Richland Center, Wis., Aug. 10, 1889.

\$15 PER COLONY, AND HONEY ALL SOLD AT 20 CTS. PER LB.; "HOOSIERDOM" EXPLAINED.

This has been a great honey year: but as I have not given the bees the care they ought to have had, much has been lost. The home apiary has yielded about \$15.00 per colony, spring count, while those that I left at my old home have done a little better. My honey is nearly all sold at 20 cents per lb. Hugh Vankirk will have about 5000 or 6000 lbs., I understand. Will you please ask Ernest what he meant in Aug. 1 GLEANINGS, p. 643, by "Hoosierdom"? It made me feel bad when I read it, but perhaps he intended us to extract some other meaning than the one given the term here.

L. W. VANKIRK.

Washington, Pa., Aug. 17, 1889.

You have given us a grand report, although Indiana, by the Statistics, reports in general a poor season. In regard to that term "Hoosierdom," we meant no unpleasant reflections upon any good people who live by the sweat of their brow in a literal sense. If you will excuse another coinage, we meant *farmerdom*, or the region occupied by the tillers of the soil, as distinct from those little spots occupied by "town chaps." See?

REPORTS DISCOURAGING.

TWO THIRDS OF THE USUAL CROP.

We have about two thirds of our usual crop of light honey, which is very nice. The outlook for fall or dark honey is poor. It still continues very rainy, and is getting somewhat colder.

Jefferson, N. Y., Aug. 9, 1889. LESLIE STEWART.

NOT A POUND OF SURPLUS.

From 100 colonies in good condition, not a pound of surplus honey was secured. Bees got plenty to live on, and we yet live in hopes of getting some for ourselves when the tie-vines bloom. So far as I can learn, the honey crop is a failure in all the surrounding counties. JNO. H. MULLIN.

Oakland, Tex., Aug. 10, 1889.

THE POOREST SEASON IN FIFTEEN YEARS.

We had excessive swarming from June 12 to Aug. 9. Bees have brought in honey enough to keep up brood-rearing. I have 80 colonies, and not a third of them have honey enough for winter. We shall have to feed unless we have an extraordinary fall. I do not look for that. We had a frost on the night of the 10th of this month that killed all buckwheat on low lands. L. REED.

Orono, Mich., Aug. 13, 1889.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 141.—*a. Do you regard the virgin-queen traffic as a benefit to bee-keepers, particularly to novices? b. If it is a benefit, what are the benefits? c. Have you found any practical plan to introduce virgin queens four or five days old, so that they can be introduced as quickly and as easily as fertilized queens? If so, please give it in detail.*

a, b. No.

S. I. FREEBORN.

I do not. I condemn it in toto.

MRS. L. HARRISON.

a. As a rule, it is not a benefit; c. No.

GEO. GRIMM.

a. No. c. Introduce them on sheets of hatching brood.

P. H. ELWOOD.

a. No; c. I think there is too much uncertainty about it.

H. R. BOARDMAN.

a. No; c. None that will work so as to commend the practice.

DADANT & SON.

a. I have my doubts; b. I give it up; c. No. We are experimenting now it that very line.

A. J. COOK.

I have not been fortunate enough with the introduction of virgin queens to say any thing in favor of the traffic in the article.

C. F. MUTH.

a. I think it may be. b. I think they may be furnished at lower prices than laying queens. c. My experience in that line is very limited.

C. C. MILLER.

a. No. b. No. I have practiced Alley's plan, with a loss of one out of every five. I have practiced no other plan. Any plan is very uncertain.

RAMBLER.

a. No, unless the novice will first learn to introduce them successfully. c. Yes, by first making the colony hopelessly queenless, when they may be introduced directly without caging.

A. E. MANUM.

I don't think the virgin-queen business will be of any benefit to any one except the queen-breeder; c. No. In making our swarms by division, we sometimes have used virgin queens just out of the cells, with good results.

E. FRANCE.

a. No, neither to novices nor to experts. c. Letting them loose at the entrance is as good as any other way. Some seasons I have no difficulty at all, but at other seasons I can hardly have one out of four accepted.

PAUL L. VIALLOIN.

My answer to the first must be a mere matter of opinion. My opinion is unfavorable to it. I let virgin queens run in the door and take their chances—with perhaps the help of a little smoke. I have never tried aged ones.

E. E. HASTY.

a. No, not at present. Whether or not it can be made practical I will not offer an opinion, but leave it to those who know more about it than I do. b. I do not know. c. No, not as quickly and easily as fertilized queens. Not with the certainty.

JAMES HEDDON.

I do not. With novices especially, I think it is likely to prove unsatisfactory. Any one ought to be able to get at least one good queen, and after

that any one with a little experience in bee-keeping ought to produce virgin queens about as well as any one else; and considering risk of loss, etc., much cheaper. Those who can not are not likely to succeed with virgin queens several days old, purchased from a distance. I have always introduced virgin queens when less than two days old.

J. A. GREEN.

a, b. I have had no experience in that line. c. No; the best way I found was in the Betsinger cage, the same as though they were fertile. I have had a good deal of experience in introducing virgin queens of different ages, but abandoned all except the introduction of very young ones, after noticing the fact that they never took their wedding-flight until the same time had elapsed *after their introduction*, whether they were one hour or five days old at time of introduction. I have often wondered whether any others have had this same experience or not; but I have noticed no mention of it by our writers.

O. O. POPPLETON.

a. If virgins could be safely introduced it would be a great benefit; but with my experience in introducing them, I would look on the trade in them as an unmitigated nuisance. The greatest annoyance I ever had was thirteen years since, in adopting your (?) lamp-nursery, and introducing virgin queens. I could hatch them by the hundred; but nine out of ten were lost in introducing. b. I have not succeeded in any plan of safely introducing virgins.

P. S.—I do not insist that Providence warned us against the use of such a device as above named, but the great lamp used in *that nursery* afterward burst, and set fire to the house of J. F. McIntyre, my son-in-law, and narrowly escaped burning it with the family.

R. WILKIN.

a. How is a novice ever to become a bee-keeper, except as he goes to work as a bee-keeper should? It is in this way that he becomes a practical bee-keeper. So I answer the question, *yes*. Every virgin queen a person handles makes him just so much the wiser along this line of our pursuit; and until a person can successfully handle virgin queens, he does not arrive at full "manhood" in our pursuit. b. Through a direct crossing of the best stock which you have, with the best stock the best apiarist in the world has succeeded in producing. A direct cross of the best specimens of a given race always gives vigor and strength not obtained in any other way. c. No, not as easily as a fertile queen can be introduced; but by the plans given in my book, I succeed nearly every time; but these plans are too long for this department.

G. M. DOOLITTLE.

a, b. I don't *know* any thing about it; but it seems to me that "novices" had better purchase only fertilized queens, except as an experiment. c. I have introduced virgin queens several days old, but not as *quickly* as fertilized ones. My method was to fix a stick in such shape that one or both ends would be of the size and shape of the inside of a fair-sized queen-cell. Wet the ends and dip them in melted beeswax two or three times, just as is done to sheet wax for foundation. Place in cool water a moment, and the wax can be readily removed from the stick. Make as many as may be needed for the season. Before using, prick three or four holes, with a good-sized pin, through the closed end of this wax cell, just about where the

queen would naturally gnaw out of a natural cell. Put the queen in head first, and carefully squeeze the open end together, and fasten to the top-bar of a frame that is in the center of the cluster of bees in the brood-nest. The holes should be large enough so the queen can get her tongue through, to be fed by the bees. This is not original with me. I read it somewhere years ago.

DR. A. B. MASON.

Our friends may perhaps remember that I was one of the first to recommend introducing virgin queens—that is, when first hatched by means of the lamp nursery; but I never succeeded in any satisfactory way, unless the queens were introduced when only a few hours old. As an illustration: One evening during swarming time a young bee-keeper drove up to our yard with some queen-cages in long strips; in fact, they looked a good deal like ten-foot poles, only they were about half as long. Every cage contained a nice-looking queen; but I thought at the time they looked rather white and fresh. He said he had bought an A B C book; but as he lived only a few miles away, he raised the queens expressly for us. We purchased the lot, and commenced introducing. In two or three weeks we had introduced most of the lot; and some later a few were laying. We were, however, satisfied that he had brought us virgin queens. We hunted him up, and he admitted it. He said he hadn't got the hang of the thing, and he supposed that getting the queens hatched was all there was to it. Now, I am sure that neither Ernest nor myself would think of accepting such a lot of queens again as a *gift*. I do not mean that there was any thing the matter with the queens. They were strong, lively, and active; but they had not been fertilized.

QUESTION 142.—*By what method do you introduce fertile queens? Explain the plan in detail, if not already generally known.*

See 141.

PAUL L. VIALLO.

The plans as given in my book. A. J. COOK.

Cage them a couple of days before letting them loose.

P. H. ELWOOD.

My method is generally known and practiced by others, which is, by the use of a surface-cage.

A. E. MANUM.

By caging the queen on the combs with a wire-cloth cap that crowds into the comb after removing the old queen.

H. R. BOARDMAN.

By various methods, depending upon the time and the condition of the swarm. A fertile queen is almost always safe when running over the combs.

MRS. L. HARRISON.

I have nothing new to offer. I have practiced most of the methods given in the books. Most of them will prove successful during the swarming season, with a good flow of honey.

S. I. FREEBORN.

Generally I let her go at once among the bees on a comb, lifted from the hive where I know they have been without a queen a few hours or days. If they treat her well I set her with the bees back in the hive; if the bees seem to doubt her right among them, I put her in a Peet or other cage, arranged so she will get out within a day or two. More valu-

able queens I introduce to a few young bees only on hatching brood, and build up with hatching brood.

R. WILKIN.

I use more than half a dozen methods—first one and then another, according to the circumstances. To explain all these methods in detail would be tedious; besides, they are all explained in back numbers of journals and bee-books.

JAMES HEDDON.

a My plan is the good old way that never fails. Take out all escort bees, and cage the queen three days. I have tried various other plans recommended, but have had indifferent success. I wish to try, this season, Cheshire's plan of running them in the evening.

RAMBLER.

When surplus queens are raised in nuclei in the yard, I frequently use the "Simmins direct-introduction" method. Ordinarily I decidedly prefer the use of the old-fashioned Betsinger cage. Both of these ways have been frequently described in all the bee periodicals.

O. O. POPPLETON.

I put the queen in a small wire cage and suspend it between two combs, near the brood, but so that she can reach honey through the meshes. I leave her caged from 24 hours, or some less, to 3 or 4 days, according to circumstances. One can tell very readily from the action of the bees whether it is safe to release her, and that is my guide.

GEO. GRIMM.

By several plans, all of which have appeared in GLEANINGS. For a very choice queen I always use the "caged-bees" plan, as I have given in back numbers of this journal, and I have never known a failure, and I have had but one report of such a failure from the many who have used the plan. I consider it *absolutely safe* in the hands of the novice or the expert.

G. M. DOOLITTLE.

Kill the old queen just before introducing the new one; then cage the new one in the hive for 48 hours, and release her by putting a piece of comb honey in place of the stopper of the cage. With an already queenless colony, we do not release the queen till we are sure there are no queen-cells, and that there have not been any for several days past; i. e., till we are sure they are otherwise hopelessly queenless.

DADANT & SON.

I generally use the Peet shipping and introducing cage. Sometimes I make a cage out of a piece of wire cloth 3 or 4 inches square. Cut a piece about half an inch square from each corner, and bend the four edges to a right angle with the rest of it, and as deep as the corners have been cut out. Shake the bees from a comb and place the queen and a few of her bees on the comb when there is honey, and set this cage over them and press the edges into the comb. This is not a new way, but I've never failed with it, neither have I with the Peet cage.

A. B. MASON.

My methods are mostly those recommended in GLEANINGS and A B C, and thus so familiar as not to require detail. For introducing a valuable queen, in times when bees are cross and no honey coming in, cage a whole comb of hatching brood; put the queen on it, and hang it in the center of the colony. Another and perhaps better way is to shake the bees all into a box, Doolittle-nucleus style, and give them the queen after they have been *worrying* for an hour or two. On giving them combs, give different combs, as far as brood will al-

low, and a different hive—but, of course, on the old location. Make them feel like strangers in a strange land, and they are not likely to attempt the overthrow of the dynasty.

E. E. HASTY.

I make an introducing-cage by taking a piece of wire cloth about five inches square, and bending the edges up at a distance of about seven meshes from the edge. Take a piece of tin of the same size; bend up two adjoining edges, and cut a $\frac{3}{8}$ -inch square out of the opposite corner. Lay the cage on the tin slide, and put in the queen, and, if necessary, a few young bees. Select a level spot on a brood-comb where there is some honey, and, if possible, hatching brood. Lay the cage on the comb, tin down; withdraw the tin slide, and press the cage into the comb just enough to hold it firmly. Leave the queen caged 48 hours, then remove the cage, unless the bees seem hostile.

J. A. GREEN.

We introduced several old fertile queens last year by putting them into the Peet cage and fastening the cage to the comb, with the tin slide drawn out. I had but one failure in 20; but I lost a \$4.00 Carniolan queen last week. I had a colony with queens in cells almost ready to hatch. She arrived at 6 P. M. We looked over the combs, and supposed we had taken out all of the queen-cells. We put the Carniolan in a Peet cage, and did not take the tin slide out. We put the cage in the hive, left it 36 hours, and then removed the tin slide and fastened the cage to a comb. About 4 days after, I looked the combs over. The queen was out of the cage. I found one queen-cell hatched, and my Carniolan queen dead in front of the hive—just because there was *one cell left*.

E. FRANCE.

The best way to introduce queens, and the safest of all I have tried or seen described, is the cage system. Cage the queen of the hive for a day or a night, or for three or four hours only, so that the bees are aware of their queen being in the cage, which, of course, is suspended (or sticking) between two brood-combs. Next, take out the cage, put away with the old queen, put the new queen in her place, close the cage with a piece of comb honey instead of the cork, and place it between the combs again in the old spot. The cage, having the scent of their old queen, and the bees knowing her to be in that cage, are cleverly fooled. They liberate the queen and receive her every time. Exceptions to the contrary are very rare. No bees should be in the cage with the queen.

C. F. MUTH.

Suppose I want to introduce a queen from a nucleus to a full colony. I take from the nucleus a frame of brood on which is the queen, with its adhering bees, and put it, without any preparation, in the full colony. The plan is so little trouble that I can afford an occasional loss by it. If the colony is queenless, and has started queen-cells, I often lift out a frame and put the queen on it upon the brood, right among the bees, without any formality; but the first plan is safer. To introduce an imported queen I put frames of just hatching brood in a hive with the queen and no workers, except those attending the queen; close the entrance and put this hive over a strong colony with a double layer of wire cloth between, so there can be no communication between the bees of the two hives; but the heat can rise from below. In four or five days, open the entrance so the young bees can fly.

C. C. MILLER.

Just at present, Ernest and myself do not quite agree about introducing queens. After the years of experience we have had in sending queens out, I do not feel satisfied that any thing else will succeed any better, even if as well, as the Peet cage, as we now have it. New inventions will come up, as they have been coming up, year after year; but sooner or later the decision is, they are no better. Then why should we make a change, and multiply, and confuse not only the rising generation but many of the veterans also?

MYSELF AND MY NEIGHBORS.

Be not overcome of evil, but overcome evil with good.—ROM. 12:21.

THIS whole matter of "doing good" to those that *hate* you has been so often repeated, and so much talked about, that these beautiful texts fall upon our ears almost without notice; and yet almost every one of us, when we get into trouble with our neighbors, forgets to make the application. Last evening our minister made the remark, that, when Melancthon was converted, he felt sure he could make the matter so plain that the world would *have* to see it; and he had faith enough to believe that the world would be converted. To his great sorrow, however, he soon found that "old Adam" was more than a match for "young Melancthon." I remember very distinctly when I had something of the same feeling. Our older readers will perhaps remember, too, the energy and vehemence with which I started out to explain and talk about the Bible truths here in these pages. For a good while, the principal point on which I exhorted was *our homes*. Further along it seemed to me as if God called me to consider next *our neighbors*; and here we are, dear friends, this bright Monday morning, once more considering this matter of our neighbors. Some of you may say, "Why, our neighbors are all right as they are. Our relations to them are all they need to be. What is the use of having any more talk on this hackneyed subject of 'our neighbors'?"

Well, sometimes I am tempted to think there is *not* much use. Some time after my conversion, in thinking the matter over I felt sure that, if I could have a good long talk with a brother of mine, who was then away, I could surely present the matter to him in such a way that he would at once embrace Christianity. He and I had discussed different matters from childhood, and a good many times I had been converted to his way of thinking, while at other times he had been brought over to my way. It seemed as plain as the multiplication table to me, that, if I could have his undivided attention, say for half an hour, he must assent to the truths and the claims of Bible teaching. He came home, and we took a walk together out in the country. Some way it is always natural for me to talk best when I am out in the open air riding or walking. Well, he gave me his attention, and I went over the whole ground. He as-

sented to many of my propositions, as I knew he must assent; but no such direct change took place in him as I hoped and expected there would. He was not ready or willing to let the world, and what it had to offer, go, and accept in its stead Jesus Christ. I have had the same experience so many times since, that I have got over being disappointed or discouraged. I learned long ago to sow the seed after my own fashion, as best I could, and leave the result with Him who rules over all; and as a general thing I feel happy when I have done my work, whether immediate results follow or not. Now to business.

In my recent travels I have had so many pleasant experiences when stopped in some unexpected place that I have rather learned to enjoy it. Whenever I am told that the time has been changed, or miss connection, my first thought is, "Well, what has the Lord for me to do here?" and then I set about finding out. At one place in Wisconsin, in reply to my oft-repeated inquiry, the station agent said, "Oh, yes! there are quite a lot of bee-men here; if you walk down the track three-fourths of a mile you will see Mr. —, who has a great snarl of hives; and up on the hill, in another direction, is a man who has lately commenced, and he is quite enthusiastic in the business, and I have no doubt he would be glad to see you. Off over the hill is another one," and so on. But as I had only three hours to wait, and my supper was to come out of the three hours besides, I concluded that he had given me directions enough. Three-fourths of a mile down the track I saw thirty or forty hives arranged under an old-fashioned shed. They were on the north side of a very pretty little garden. Every thing was neat and tidy, but they evidently were not quite up to the times in every thing. I talked a little while with the old gentleman who owned the bees, but he did not seem to know much about the bee-journals nor about their editors. He said his son was out harvesting, but added that he would be home soon, and he would doubtless be very glad to see me. So I walked back to the depot; but just as I had reached there, however, a young man (the son) drove up briskly, and expressed great pleasure in meeting A. I. Root. He said he was working hard to get money enough to complete his education, and, of course, he and I were friends at once. I proposed making a brief call on one of his neighbors; but he seemed to be a little bit backward. There had been differences between them, mainly in running each other on the price of honey. I urged him, however, to go over with me, suggesting that, if they got better acquainted, they might possibly agree on some price so as not to cut each other. After a little urging he replied, "Why, of course I will go;" and we three had quite a pleasant little chat together. The last-named friend had his hives neatly painted, and set each one under a forest-tree, where a partial clearing had been made in the edge of the town. It was a very pretty place, and the hives were very neatly cared for; although I found in a few moments that some of

them were crammed full of honey, and the bees were hanging idly on the outside, it being in the height of basswood bloom. These were both fine, intelligent young men. They had it in their power to assist each other greatly, and yet they had been on bad terms, just on account of the value of a few cents. At another place I met the same state of affairs. One man said to me :

"Mr. Root, we used to have a bee-convention here, and I loaned books to my neighbors, looked over their hives, and showed them how. I let them take a hive for a model, and things of that sort. But how do you think it turned out?"

I replied that I hoped it turned out pleasant and profitable all round.

"Not a bit of it. Just as soon as they had got a pound of honey to sell, they rushed into town with it, found out what I had been getting right along for mine, and then offered to sell it to the groceryman for two cents less, if he would take their honey instead of mine. I am clear disgusted with this work."

The above sums up one of the most grievous troubles among neighbors, especially where both keep bees. They get along very friendly and nicely until it comes to the matter of disposing of the crop. Honey can not be rushed off as many other things are, and these beginners are almost always in need of a little ready cash. Forgetting the accommodation they have had, they too often, in their sudden eagerness to turn their work into cash, do something like what has just been described. I should not wonder if quite a lot of my readers say, as their eyes take in this thought, "There, that is just my experience exactly. But I have got done with teaching people how to keep bees, just for the fun of it, and then having them undersell me, just as soon as they get a few pounds of honey."

Please do not be in haste, dear brother, to come to such a decision. I know these things are bad, but it only shows the selfishness of humanity. It is not our neighbors alone, but it is ourselves; and this same in-born sin exists in our own families and in our own hearts. The remedy is in the beautiful little text at the head of my talk to-day: "Be not overcome of evil, but overcome evil with good." What a grand thought it is! and, oh how much better than to say you will not have any thing more to do with them, as we often do! Of course, I recommend Christianity and a Christian spirit when these things are told me; but too often the reply is, "Mr. Root, the church-members do not do a bit better. The very neighbor I was telling you of belongs to the — church." Some go still further and say, "Why, even the minister did so and so."

One afternoon I was having a very pleasant chat with a particular friend of mine. He and his wife, with their children, were sitting out in the shade of the apple-trees, close by the apiary. While we were talking, a man came up and wanted just one planed board, such as friend — has stacked up ready to make hives. He is a supply-dealer, and has a small engine and buzz-saw. He keeps the regular hives in stock;

but as orders frequently come for something different, he keeps a limited quantity of nice boards right close to the saw-table, ready to be cut up as wanted, at a moment's notice. Well, this neighbor wanted just one of these boards. My friend, in a gentlemanly way, explained that he would very much rather not let them go. After he had gone, I suggested:

"Why, friend —, can't you get enough for those boards to afford you a good profit, and at the same time accommodate your neighbor? I noticed that you did not say any thing about the price, neither did he. Now, I would have said, 'Neighbor —, I do not like to spare these boards; but if you need one bad enough to pay me so and so for it, I will let you have one, and replace it soon.'" He glanced at his wife, and just then it occurred to me that perhaps the neighbor might be slow pay, or something of that sort. It was as I surmised. Instead of paying for the board, he would have wanted it charged, and that would have been the last of it. A little more questioning brought out the fact that this neighbor was their minister.

"Why, friend —, you do not mean to say that your minister does not pay his debts, do you?" He assented, and then said that the same individual owed them a milk-bill that had been standing so long he had no hope of getting it at all. At this I rose to my feet. The wife assured me that it was all so. I insisted that there must be some extenuating circumstances, or something I did not know about. Now, my bee-keeping friend is a pretty good man, even if he is not a member of any church. He replied in a manly way:

"Yes, Mr. Root, there is an extenuating circumstance. This man receives such a miserable pittance for a salary, that he can not very well be honest, even if he wanted to ever so much. His congregation is small, there are no wealthy members, and I really do not see how the poor fellow does get along as well as he does. Now, I do not mind the amount of the milk-bill, even if it is hard to furnish milk regularly, and not get any pay for it. If he or his people had asked me outright to donate the amount I would have given it willingly. But that is not the point. I do not like the way of *promising* to pay, and then not paying."

Now, friends, we are getting to the bottom of the matter, I believe. The real truth of this trouble, and a good many other troubles of this sort, is that Christ's cause is at a very low ebb in these localities. The churches are small, and even those who do attend and try to support the minister are weak in faith, and, as a consequence, weak in finance. They scrimp their minister, and he scrimps by not paying his honest debts. The consequence is, he can not *possibly* preach a real gospel sermon. His Christianity is pinched and starved out of him. Who is to blame? It is just like living in a community where boys steal melons and honey. Instead of laying the blame all on the boys, it lies on the community in general. They lack the spirit of the little text. In one of our prominent agricultural papers a few

weeks ago a well-known writer spoke of watching his berry-patch on Sunday. It took so much of his time that he could not go to church; and in spite of his efforts, the boys and even men came there and carried off his berries in tin pails. Finally he *caught* a little fellow and kicked him with his great boot. What should he do? Why, bless your heart, dear friend, I should do exactly as the Bible teaches. "Be not overcome of evil, but overcome evil with good." I do not want to boast, dear friends—far be it from me to do so; but I do want to say that our honey has never been stolen, and our melons and berries have never been stolen—that is, to amount to anything. Some of our small boys did at one time last June get into a habit of cramming their pockets with great green Jessie strawberries; but the saddest part of it to me is, as I look back, that even Uncle Amos lost his equilibrium, and scolded one boy, and made him take the great berries out of his pockets. The boy had been hoeing, and was tired and thirsty; and the berries with their pink cheeks looked so tempting to him, who could blame him? Yes, I scolded; but I afterward felt bad about it, and he felt bad too; and I talked the matter over with him pleasantly and good-naturedly. I told him that, if all my boys did that way, there would not be any berries to get ripe.

He assented, and promised not to touch another berry unless I gave them to him, but to go and buy them at 5 cts. a pint boxful, the way everybody else did; then he would not have to stick them in his pockets, and feel guilty while he was eating them. I never knew him to touch a berry afterward. He and I are real good friends. He helps me and I help him. Now about the ministers:

There are a great many ministers who read GLEANINGS. God bless the dear hard-working brothers! How I do love to get hold of their hands and talk over these matters! They know me pretty well, most of them; and even if I do touch on something that reflects on them just a little, I think I know beforehand that they say in their hearts, "Go on, brother Root; don't spare us." I say this because I do firmly believe that they are hungering and thirsting after righteousness and godliness, and that they will rejoice at any thing that helps righteousness to prevail. During my travels I urged a good friend of mine very hard indeed to go to church one Sunday evening. He said he was pretty certain that it would not do him any good; but as I was his guest, he of course gave way. Well, I was very anxious, as a matter of course, that the sermon should be spiritual and inspiring. I felt anxious for him during all that discourse, and I found out afterward that he felt anxious for *me* in the same way—that is, he wanted the minister to do well, so as to give me a good opinion of their neighborhood and people. I am sorry to be obliged to say that the sermon did not have very much heart in it. There was a great deal of Scripture quoted, but it did not have any *particular* application that I could see. The minister pounded the desk, let his voice sink

to a whisper, and then spoke in thunder-tones. It was a kind of old-fashioned preaching that some of you may have heard years ago. On the way home my friend explained that the regular pastor was absent, and that this man was called in, rather than have the audience go back without any sermon. He went on:

"Of course, I need not tell you there was no particular point in any of his remarks; and I think I will just mention that one reason why I did not find very much good in it was because that man has been owing me for three or four years for honey."

"Oh! but, friend —, he will pay it, even yet. Perhaps he has had bad luck."

"Yes, Mr. Root, he *has* had bad luck, and always *will* have; and he has probably got discouraged because he is owing more than he can ever pay, possibly, and now I am afraid he buys every thing he can get trusted for, without any expectation of paying for it. The sad part of it is, that our people will, knowing these things, occasionally ask him to preach."

Well, my friend who sold the milk went on, and we were discussing ministers' salaries. He maintained that, to get a good honest minister, as well as to get a good honest man for any purpose, you must pay him a decent salary. There are, in the market, doctors, schoolteachers, and even ministers, of all grades. If you take up with a low-priced man you will have to take the consequence. It is a sad state of affairs, dear friends, I know; but is there not some truth in it? Suppose your pulpit is vacant, and you are looking about for some one to fill it. You will have applications from a good many directions; and when you have some one in view it is natural to make inquiries. Well, suppose the inquiries result in something like this:

"Mr. So and so is an excellent man in many respects. He is a fine orator; quotes Scripture accurately, fluently; is a good leader; is pleasant and courteous, etc." But suppose the letter should end up by saying, "He has one grievous fault; he makes purchases unwisely, and is always behindhand and in debt. You can, however, get him at a *very low price*."

Now, I do not know that such a state of affairs exists; in fact, the bare thought of it gives me pain that any of God's appointed servants should be so inconsistent, or blind to the sacredness of their calling, as to utterly spoil and ruin all their chance of leading souls to Christ. I proposed to my friend that he go right over to his neighbor's, and have a plain talk with him in regard to the matter; but he thought it was out of his line.

Now, I do not remember that I ever knew personally a minister who did not pay his debts. I have, however, known several church-members who were very *slow*—yes, some who were quite active Christian workers. Some little time ago one of these brothers was under discussion, and one person remarked, "He has owed me something toward twenty dollars for three or four years, and I have not any idea that he ever expects to pay it." Of course, I remonstrated

ed, but he insisted that it was true. In a few days I saw this brother, and told him plainly that I feared his being so dilatory was a reproach on the cause of Christ. Of course, he had a number of extenuating circumstances to tell me. There had been much sickness in his family, and he did not know that the man he owed felt as he did about it. He, however, admitted that it was a shame, and that the account *ought not* to have been allowed to run as it had been. As he had not the money to settle it just then, I proposed loaning it to him, telling him he could pay me when he found it convenient. He seemed deeply touched. The account was promptly settled, and in a few months he paid me, and interest also, for the use of the money. Now, friends, this is one of the ways of overcoming evil with good. I hardly need tell you that I felt happy over that investment. Why, I do not know when fifteen or twenty dollars has afforded me so much pleasure and real satisfaction. Before this we were not on particularly friendly terms either; but since then it is always a pleasure to me to meet him, and I am sure that he feels exceedingly kind and friendly toward me. If I knew a minister who did not pay his little debts, I think I should go to him in just that way. If his salary is small, and *you can afford it*, just donate him right out enough to set him free from his little embarrassment; and if you do not find that you have been laying up treasures in heaven by so doing, I shall be disappointed.

Now, just a closing word to the bee-friends, especially those who have had trouble with their neighbors in the ways I have mentioned. Do not try to cure these troubles by letting them alone. Do not repeat to your other neighbors and friends the story of their delinquencies and faults. Go to them in a friendly way. If you have the spirit of the little text in your heart they will not be offended. You need not fear that they will think it none of your business; but if you *should* have a neighbor so hardened as that, do not be troubled. It does not hurt a Christian to be snubbed, when he is trying to do his duty. Our pastor, who has gone to China, once said, "A real true follower of Christ can not be snubbed or insulted;" that is, an insult can not be given where none will be taken. The true Christian forgives unkind words, almost before they are uttered, and *makes haste* to overcome evil with good. Why, God bless you, my friend, you do not need to be put out, even if some thoughtless neighbor *has* sold his honey lower than he need to, and thereby spoiled the established price. Go and talk with him about it; let him see that your heart is large enough, and that you are magnanimous enough to be friendly and kind, even if he had done *ten times as much* to injure you. You can not afford to be spiteful and unfriendly because of such troubles. One of our bee-men raises blackberries after the honey season is over. I think I will not tell his name. Well, he has a very large patch, and carries them to the surrounding towns. They were going off nicely at 12 cents, and the proba-

bility was that there would be no need of selling cheaper. Finally some neighbor who had a small patch began selling his for 10 cents. Our bee-keeping friend remonstrated, and finally offered to pay him cash down, right at his home, 10 cents for all he raised. I should have supposed that this, of course, would have settled the matter pleasantly. It seems it did not, however. The ten-cent neighbor refused to sell them in *that way*, but was just contrary enough to insist that it was his *privilege* to carry them around and *retail* them out at 10 cents, if he wished to. A case of the same kind occurred in friend Freeborn's neighborhood, with honey. Perhaps some of you say, "Now, Bro. Root, what are you going to do with men who are stubborn, contrary, and ugly, as in the above case?" My reply is, that I am still going to overcome evil with good.

If you will turn to the 12th chapter of Romans, where our text comes from, and look at the verse just above the text, you will find this:

If thine enemy hunger, feed him; if he thirst, give him drink: for in so doing thou shalt heap coals of fire on his head.

These friends have to be conquered by heaping coals of fire on their heads. Very much depends on how you do it. It requires skill and tact, and, above all, a kindly spirit of love for your neighbor, in your heart. Few men like to be "bossed" around, or, if you choose, most of us dislike to have our liberty of action interfered with. Satan gets his finger in the pie, and sometimes it takes quite a little effort and quite a little time to rout him entirely. But it can be done. Do not, I pray you, be weary in well-doing. Do not get discouraged, and say, "It will not work with this man." Make up your mind that you are going to say, as did Gen. Grant, "We will fight it out on *this line*, even if it takes all summer." Grant was fighting an *enemy*, and *you*, my friend, are fighting an enemy; but the enemy is *not* your misguided neighbor. It is *Satan*. Why, you can not enjoy life at all as God intended you should enjoy it, without being at *peace* and on *friendly terms* with your neighbors. Quite a few times, when I have asked one bee-keeper to drop his work a little while and go with me to see some bee-keeping neighbor, he would say, "Why, the truth is, Mr. Root, we do not have much to do with each other nowadays." I believe, however, that I have always succeeded in getting them to drop both work and hostilities, and go with me; and it has happened more than once or twice, that explanations and misunderstandings were straightened up right in my presence. Now, do not be cross, dear brother, even if people are greedy and selfish. It is nothing at all strange; in fact, it is nothing strange if you find *me* at times greedy and selfish. If you do, however, I want you just to grab right hold of me, and give me a good shaking. If you can not do that, say in your letter, "See here, old friend, why don't you practice a little better what you preach?" I shall not be mad, I assure you. May be I will straighten up. Now, then, whenever you meet evil in any form, especially among

your own neighbors, please believe your old friend when he tells you not to think of overcoming evil with *evil*; but please bear in mind that it is a *thousand times better* in every way, shape, and manner, to "overcome evil with good."

NOTES OF TRAVEL.

A. I. ROOT AMONG THE BEE-MEN OF WISCONSIN.

PERHAPS I was in a happy frame of mind that afternoon when I came into the town of Boscobel. I had just been exhorting my friend the stage-driver to have more faith in humanity and in Christianity; and I do not know but that this made me feel happy. Besides, Boscobel is a very pretty place. Before we fairly got inside of the corporation we saw a very pretty group of bee-hives; but as my time was limited I did not stop. I had in my memorandum the name of Edwin Pike, and we soon found that he was near the center of the town. When we were pretty near where we were directed, I told my companion that he might drop me before the gate of a very pretty little residence, with hives orderly arranged, and painted in tasty colors. Right near was also a very pretty garden, and some thrifty young strawberries just taking root. I took it for granted that this was friend Pike's; but I soon found out that it belonged to Benjamin Rice. Friend Rice was at work with a helper, among the bees. They stopped extracting, however, when they found that A. I. Root was their visitor. Friend Pike's place was only the second house from where we were talking. I suggested that we go over and find him, as I had only about an hour before train-time. Now, I felt pretty sure, when I looked over friend Rice's apiary, that I should not find another so neat and so pretty, in the whole town of Boscobel; but friend Pike was not one whit behind. Why, it is really funny to see two such very nice men with such wonderfully nice homes so close together. I wonder if they ever have any trouble about cutting under prices in the sale of honey. I did not have much chance to get acquainted with their wives and children; but I felt glad to find myself a welcome visitor among such really intelligent, progressive people. Well, I soon learned there was a Mr. Dexter, not half a mile away, who kept a great lot of bees. Two or three hundred, if I recollect right, were in one locality; and when I told them how soon I must leave, they managed to enable me to have a few minutes' call on friend Dexter. Friend D., too, had been extracting; in fact, he was pretty well tired out when I came there. When I went to look at his apiary I expressed surprise that so many bees would do well so close together.

"Why, Mr. Root," said my new friend, "it would not make any difference if I had 500 instead of 200 right here in this yard."

I suggested that perhaps that was an extra good season.

"No, it is not," said he. "We have sea-

sons like this right along—that is, when the basswood is in bloom."

There were such exceedingly great clusters of bees hanging to the front of his hives that I asked him if he was sure they all had room inside. He replied:

"Why, I am perfectly sure they have *not* all the room inside. See here. Do you see along that row of hives? Well, you notice that at one particular point the great clusters on the outside suddenly cease, and the hives are comparatively clean."

I nodded.

"Well," resumed he, "we got just so far in that row with extracting, and every hive was crammed full as fast as we came to it."

I suggested that, if they were *my* bees, I should keep on extracting until dark, any way; but he shook his head, and said that he had already done hard work enough for one day. His friends told me afterward that he was one of the sort of men who do not worry themselves greatly, no matter how much honey is going to waste; and very likely there are extremes both ways in this matter; but I think there are quite a few among our readers who would not only extract till dark, but possibly till midnight or later, rather than let the bees hang by the bushel on the outside of the hives for want of room. It was about train time. As I started for the buggy I told friend D. that, if it would not make too much trouble, I should like to shake hands with the women-folks, even if I did no more. Did it ever occur to you, dear reader, that there are lots of happy and pleasant homes in this wide world of ours? It is true, there are some contrary and difficult people to get along with; but I tell you there are ever and ever so many good people also; yes, and even among the bad ones there is a good side to almost everybody. I guess I was in a mood that day of catching hold of the good, and not seeing the other, if there was any; but I shall always remember Boscobel as a very nice place with many nice people in it. I told you, in Our Homes for last issue, about my visit that same evening with friend Snyder. With your permission we will just skip along until I step from the buggy and say good-by to Mr. Fiddler and his wife. This was just before the residence of Mr. Pickard, at Richland Center. Mr. P. had just got on his mowing-machine to cut some grass. He saw me come down the lane with my Kodak strapped across my shoulder; but he remarked to his hired man that he thought I must be some book-agent, and so he drove to the other end of the lot just as fast as he could, indicating that he was very busy. I wonder if there are any book-agents among my readers. If so, this gives you something of an idea of how people, many of them, feel when they see you coming. Well, I did not bother friend P. just then. The young ladies at the house told me their mother was in the apiary; but before I got there my attention was called in another direction by a babbling brook that came forth from a beautiful little spring that just poured out of the ground on one side of the spring-house. A little way off from the spring I found a very bright,

intelligent lady taking entire charge of something like 200 colonies. With the help of an assistant they had been extracting; but a swarm had just come out, and while we were talking another came. The day was intensely warm, and I could not but admire the energy that this lady showed in going right out in the sun and giving the bees the needed care which came all in a heap, as it were, during the height of the basswood yield. Her attention was first directed to bees when friend Freeborn, a year or two before, planted an out-apiary in her vicinity. She became interested, and finally purchased the apiary complete. Her first venture was in paying \$600 for 160 colonies of bees, and this while she knew next to nothing about bees. I should have said at once that it could result in nothing but failure. Not so, however. If I remember correctly the bees were all paid for with the first crop of honey, and now she is a well-to-do bee-keeper. "Who does the housework?" do you ask? Why, a couple of nice bright daughters manage it nicely, and it probably does them as much good, as it does the mother to manage the bees. Think of it, ye of the fair sex, who are thinking the heat is too great to do more than fan yourselves, sit on the sofa, and wait till it gets cooler.

Before I reached friend Pickard's my attention was taken up with a queer-shaped bluff in the neighborhood of the apiary. The ground rises so abruptly on all sides that it takes a man or woman of pretty good wind to climb it on a hot day; and when you arrive at the summit you are confronted with a ledge of rocks rising perhaps fifty feet higher than the summit of the hill. By a sort of winding stair, of nature's own make, filled out in one place with a crotched tree, you are enabled to climb to the summit. I tried taking this bluff with the Kodak. It was a pretty large subject for so small an instrument, and the view was hardly worth reproducing. On the way down the hill I rather forgot the warm weather and the perspiration my climbing had put me in, at the sight of a blooded Jersey bovine belonging to friend Pickard. He devotes his attention to fine cattle, while his wife tends to the bees. We tried the Kodak on his majesty—that is, when we could get him to stop bellowing and pawing long enough to get his picture; but for some reason (probably the operator's inexperience) we did not get a picture fine enough to reproduce. I should have enjoyed myself greatly had it been possible for me to stay a day or two; but my leave of absence was coming so near to a close that I fear it pained my good friends by declining to stay to dinner; and a little later on, friend P. and myself were speeding behind a couple of blooded ponies, on the way to friend Freeborn's. You will remember that it was to call on this latter friend that my visit was mainly undertaken. More beautiful springs enlivened the way, as we passed through the basswood timber of Richland County. But I think I shall have to tell you in our next of my visit to friend Freeborn's.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

ENLARGEMENT AND MULTIPLICATION IN OUR DOMESTIC INDUSTRIES.

THE question has often been asked, "What may a single colony do in the way of increase in a single favorable season?" I do not believe that any of us yet know the possibilities, even by natural swarming. In poultry-raising, how many chickens may one hen become the mother of in a single year, or say two years? Before you answer, perhaps you had better think about it a little. Again, how shall we manage to get the largest number of colonies that will winter over, or, in the other case, the largest number of good strong healthy chicks? Just at present I am having a good deal of enjoyment in seeing what four strawberry-plants may do in one season. They are in the middle of one of our highly fertilized plant-beds. The ground is nearly half manure, and it has had considerable bone dust worked into it besides. The soil is nearly two feet deep. Whenever I want to enjoy myself I just go and take a look at those strawberry-plants. I especially enjoy the beauty of the foliage when the dew is on the leaves. Well, how shall we make a single strawberry-plant do its utmost? I did think at one time that removing strong plants by means of our transplanting-tubes would be a gain; but now I am inclined to think you would do as well, or better, as follows: Set your one strawberry-plant in the middle of a bed of fine rich soil, say a plot of 20 feet square, and may be more. As soon as a runner makes its appearance, encourage it to grow in a straight line until the new plant appears; then lay the runner in a shallow trench, may be half an inch deep. Push the fine dirt over all except the little plant at the tip end of the runner. Divide the runners all around the plant in the shape of spokes to a wheel; but make each one reach out just as far from the center of the plant as possible; that is, make them come out into new ground and sunlight just as soon as you can without severing the runner. If you commence early in the spring, and keep off all fruit-buds, by July or August you will have a pretty fair strawberry-patch. It is quite an exciting little problem to so manage as to give each little plant as much room as you can, and at the same time let dame Nature have full sway by putting out just as many runners as she wants to. The plant will seem to catch the enthusiasm, and strain every nerve in the effort to propagate its own species and build up a thriving little family. Pick out every weed as soon as it gets barely visible to the naked eye. Assign a place to each runner, and cover it with a little dirt, keeping the ground constantly raked fine, and your 20 feet square of strawberry-patch will be a surprise and joy to you. When the plant gets to booming, it wants care almost every morning. What will you do next year if you are ready for fruit? Well, I have not figured out just yet. You can take up the plants with the transplant-

ing-tubes this fall or in the spring; but I don't exactly know how to manage it as it is, without a great amount of hand-weeding. Can anybody help me?

If you are going to see how far you can increase one strawberry, or perhaps half a dozen, it will pay you to commence with some of the high-priced new varieties; and we suggest the Jessie, Bubach, Haverland, or the new Miami. The latter has recently been brought out by one of the bee-friends. See advertisement in this issue.

You can get a large amount of fruit by letting plants stand without any transplanting at all; for this is exactly what they do in the matted-row system. But it is disorderly, and very apt to be weedy. There is not nearly room enough, especially if you want large-sized berries. I will tell you how we manage to get our large berries. In fact, this 28th day of August (although right in the midst of a tremendous *hot dry spell*) we are putting out our plants. The ground is where we grew Ford's Early sweet corn. Just as soon as the last ears were picked, the stalks were cut down and taken off the ground; then we covered it with the best stable manure we could get, until we had on as much as could well be plowed under; in fact, a boy followed the plow with a stick in his hand, to push the manure out of the way whenever it piled up in front of the coulter. After plowing, it was harrowed first with the Acme, then with the disk harrow, and then rolled down level with the roller. Then we spread on another coat of very fine manure with the manure-spreader. This fine manure was "harrowed in" with the *grain-drill*, while we sowed 500 lbs. per acre of Mapes' "Complete" fertilizer. Perhaps you think this is a tremendous manuring; but I tell you, friends, when you are fixing ground for strawberries, there is a chance for getting your money back, even if you do "manure tremendously."

Now, then, we are ready to fix the ground for plants. Our ground is heavy clay; but we get more and larger berries on our heavy clay than we do on the creek-bottom land. The creek bottom is the place for nice plants with great bushy roots; but the clay hills are the place for fruit. Of course, the ground is underdrained. But this is not enough. We have suffered so much from wet that we plow our ground into pretty high furrows, a great deal as people fix it for sweet potatoes, and plant our berry-plants on the top of the furrows. Of course, for strawberries the furrows are flattened on top. With our disk marker we go over the ground and furrow it until it looks exactly like the cut below.

FIXING THE GROUND FOR STRAWBERRIES ON CLAY LAND.

Our disk furrower makes the bottom of the furrow concave or trough-shaped, as we see at A. Now, while we mark it for strawberries we fasten a piece of board between the disks so as to make a small furrow at the top of the ridge, just as you see it at B. This morning, we, by means of hose and several lengths of iron pipe, carried water

from the hydrant right over to the strawberry ground. As the ground was baked hard, and dry, the water was first turned on the plants that were to be taken up.

When it was wet enough, our transferring-tubes were pushed down over every good strong plant. They were then placed on a wheelbarrow and carried to the new ground.

Now they are set just about a foot apart in this shallow trench B. While they stand here, before the tins are taken off, run a Planet wheel-hoe so as to throw the sharp ridges of dirt each side of B, up against the transplanting-tubes. Now a boy comes along with a watering-pot and fills the tubes with water, as I have explained. When the contents of the tubes become soft, like mud, they are shaken a little, and the tins are withdrawn; then we go after another load of plants. The fine earth thrown up by the wheel-hoe settles around the plants so as to protect the wet ground from baking under the influence of the hot August sun. With three or four hands that are used to it, the work goes on so rapidly that we do not find it expensive; and in several thousand plants, scarcely one dies. In our plot, set a year ago in just this way, the losses were so few that we never went over it again to replace them; and the crop of Jessies in June abundantly paid all expenses. But a better crop is to come next spring. The cultivation is very simple. Whenever they get just a little weedy, this same disk marker is again drawn through the field, the horses walking in the paths A, and the disk scraping the ground perfectly clean and smooth, at the same time throwing a little fine earth around the plants. All the rest of the work is a little hand-weeding along the narrow ridge where the plants stand, and cutting off the runners as fast as they appear. Now, I think that this matter of watching for runners, and pinching them off, is just the nicest work in the world; but I can not find a man or boy that seems to like it; in fact, the greater part of them will say it is all done, when I can see runners starting out here and there all over the patch. It is because they do not *love* the work as I do. The sight of a runner indicates that the plant is getting hold of the manure and "feeling its oats," as we used to say of a spirited horse. At this stage, pinching off the runner is laying the foundation for those great berries that look like peaches in size, and are away ahead of them in flavor. Why, I just wonder that the whole world does not grow happy and healthy in raising berries. Some of you have thought friend Terry a little extravagant in recommending strawberries instead of patent medicines. Now, look here, friends: I have been in very poor health; in fact, they had to turn me out—not to "grass," but to gardening and berry-raising, to save my life. I am now exceedingly strong and well, and can work out in the hot sun from daylight till dark, and just laugh. Several have criticised friend Terry because he spoke about eating a *quart* of strawberries at a meal. Why, you are beside yourselves. I not only eat a *quart* of strawberries at a meal, but ever so many more, between meals. When I get tired and

thirsty, between ten and eleven I take a pint basketful and eat them just as you would an apple. Strawberries are gone now, so I have to take blackberries.

Well, a great many say we must not eat things before going to bed. Now, I have repeatedly taken a pint of blackberries, just at dusk, to see what the result would be. There was not any bad result at all; but I felt just as fresh, happy, and strong in the morning as one might who has never known any thing of sickness. In fact, I have tried repeatedly so see what harm it would do to eat berries in excess at almost any time of day. While I am engaged in my outdoor work it does not do a bit of harm. I notice this, however, that I am getting a real dislike for meat victuals during hot weather. Give me berries and milk and good bread and butter, and you may have the rest. Plenty of berries is a great saving of the meat-bill; and where you raise the berries yourself they are *certainly* the cheapest. Why, my good friend, have you not felt repeatedly, especially as you get up in the morning, during hot weather, that you do not want any *cooked* breakfast at all? A bowl of good milk from the cellar or refrigerator, some nice ripe berries, and a little good bread and butter to go with it, seems to be a relief. Possibly your good wife may find it a relief also. Of course, there are things raised in the garden that seem to take the place of berries; but although I have been, at different times in my life, a great advocate of meat, and I am yet in cold weather, I do believe that health and happiness come with fresh *fruits and berries*, instead of animal food, in *hot weather*.

THE PEACH TOMATO, ETC.

After my remarks in the last issue, we received the following from W. J. Green, of the Ohio Experiment Station:

A VEGETABLE-WAGON BELONGING TO OUR OHIO EXPERIMENT STATION.

Friend Root:—You speak favorably of the Peach tomato, but say nothing concerning its quality. In my opinion it is unexcelled for slicing. We send out a wagon, after your plan, to dispose of our garden products, as so many people came here to buy vegetables and fruits, and annoyed us not a little. To get rid of this annoyance we commenced delivering our products at the houses of our customers. We find this part of our work to be much more useful than we supposed it would be. We simply thought to turn our products into cash, and then put the money into improvements in other experimental work; but we have found that we can now carry our work a step further than we had thought of doing. We now not only learn the comparative value of the varieties in the field tested, but, what is often quite as useful, we learn what sells the best in the market. By retailing we learn this much better than by wholesaling. The Peach tomato would hardly sell at the groceries; but some of our customers got a taste of them, also to using them, partly for table decoration, as they would peaches or any showy fruit. That is, they set the tomatoes in dishes on the table, whole, and slice and eat as wanted. The result is, several different ladies want all we have, and our salesman (Mr.

Turner, a Medina Co. boy) says that he could sell Peach tomatoes the season through at five cents per quart.

I can not say where or when the peach tomato originated; but it is not new. It seems to have dropped out of cultivation, nearly, for years. Landreth catalogued it a year or two ago. Livingston brought it before the public more prominently last year, and now I hope it will not be allowed to drop again. Careful selection ought to increase its size.

W. J. GREEN.

Ohio Experiment Station, Columbus.

Many thanks, friend G. But I am a little surprised, even now, that you lay no stress on the fact that the Peach tomato *never* rots. As you suggest, it can not well take the place of our large tomatoes, on account of its inferior size; but its other qualities, especially its unexcelled flavor, are, I think, going to give it a prominent place in our gardens. I am rejoiced to know that you are sending out a wagon. Why, it can not help but be a splendid thing in connection with your work of testing fruits and vegetables. I had not thought of it before, but there is no better way to test things in the world than to take them fresh from the garden and present them to the attention of people around at their homes. And I think it will demonstrate that many a man—yes, and woman too—who is out of employment may earn a good livelihood by raising and disposing of things in this way. There is another thing that I much enjoy in connection with our vegetable-wagon: It comes around about nine o'clock for fresh berries and vegetables. Well, in front of our store we have a long stand for the display of fruit and garden-stuff. As the boys bring the things in from the field, it is my *privilege*, when not too busy, to arrange them on this stand. We have apples, pears, peaches, berries, grapes, etc.; cabbages, squashes, tomatoes, little yellow pumpkins (the early ones I have told you about), summer squashes, beets, turnips, and every thing that grows. Well, I have learned that, by making a pretty show of these things, people will stop as they go by, and I have often made quite a few sales in this way. A great deal depends on having things look well. For instance, Livingston's Beauty tomatoes are put in clean new baskets holding half a peck, each tomato being wiped with a damp cloth until its glossy surface shows to advantage. By the way, I am inclined to think that there is not a prettier tomato grown than Livingston's Beauty. When people ask what kind they are, I reply, "Livingston's Beauty." They often exclaim, "Well, they are beauties, sure enough." The larger Ignoutums and some other varieties are mostly round and smooth; but the Beauties are *all* handsome, every one of them. This year we have not an ungainly tomato on these vines. Brother Livingston, we thank you for having given us the Beauty tomato, and we feel a little bit proud of the fact that you are an Ohio man, and right near our Experiment Station at Columbus. Now, Bro. L., can't you take hold of this *Peach* tomato and make it just a little bit "bigger"? May be Bro. Green can help a little.

CONVENTION NOTICES.

The next meeting of the Fayette Co., Ohio, Bee-keepers' Association will be held at the residence of Mr. Joseph Bonham, Washington C. H., O., on Wednesday, Oct. 2, 1889, at 10 o'clock. S. R. MORRIS, Sec'y.

The annual meeting and basket picnic of the Progressive Bee-keepers' Association will be held at the residence of Mr. F. E. Dutton, near South Newbury, Georgia Co., O., on Thursday, Oct. 3, 1889. All interested are invited to attend. Bedford, O., Sept. 10. MISS DEMA BENNETT, Sec'y.

The American International Bee-keepers' Association will meet in the Court-house, Brantford, Canada, Dec. 4, 5, 6, 1889. All bee-keepers are invited to attend. State and district bee-keepers' societies are invited to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Any one desiring to become a member, and receiving the last annual report, bound, may do so by forwarding \$1.00 to the secretary. R. F. HOLTERMANN, Sec'y.

The Northwestern Bee-keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., Chicago, on Friday and Saturday, Oct. 11 and 12, at 9 A.M. Arrangements have been made with the hotel for back room, one bed, two persons, \$1.75 per day, each; front room, \$2 per day, each person. This date occurs during the exposition, when excursion rates on the railroads will be one fare for the round trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation." W. Z. HUTCHINSON, Sec'y.

Black and Hybrid Queens for Sale.

Fifteen choice untested Italian queens, at 35 cts. each, or four for \$1.10. G. H. DENMAN, Pittsford, Mich.

Four very prolific hybrid queens, two of them nearly pure Italians, at 30c each, or all four for \$1. FRANK MOORE, Frost, Ky.

BEE-KEEPERS and FRUIT-GROWERS,

Send for my price list of BEE-KEEPERS' SUPPLIES and STRAWBERRY-PLANTS. Twenty-five varieties to select from. Address F. W. LAMM, Box 106, SOMERVILLE, - BUTLER CO., OHIO. 18-23db

Writing and Pencil Tablets.

We have secured a bargain in these, and propose to give you the benefit of it. We have thirteen different styles, of which we give size, number of leaves, name, and price, in the following table. You can write with a pen on any of the tablets, although most of them are designed for penciling.

Name or Designation	Size in inches	No. of Leaves	Post on 1	Price 10
Our Pets Ruled Pencil Tablet	5 x 8	60	5	25
No. 0 Ruled Pencil Tablet	5 1/2 x 8	70	5	25
Ideal Unruled Pencil Tablet	7 x 10	30	5	30
Monumental Unruled ditto	8 x 12	65	10	5 15
Greenaway Ruled ditto	7 1/2 x 10 1/2	42	6	5 10
No. 00 Ruled Pencil ditto	4 x 10 1/2	70	10	7 60
Geographical ruled ditto	6 x 9	180	12	7 60
Student's Note-Book	5 1/2 x 8 1/2	80	8	7 60
America Writing Tablet	6 x 9	60	8	7 60
No. 36 Writing Tablet	5 1/2 x 8 1/2	65	8	7 60
No. 65 Thin Writing Tablet	5 1/2 x 8 1/2	80	7	15 20

In case we get out of any one style we reserve the right to substitute one as near like it as possible. Notice, the cost of mailing is greater than the original cost, so that you don't get much benefit of the low price unless you can order with other goods by freight. "Our Pets" has assorted chromo pictures of children with pet animals on the covers. "Ideal" has assorted child's faces. "Monumental" has a picture of Garfield Monument. "Greenaway" series have assorted chromo pictures. "Geographical" have assorted maps of different States. Student's note-book is thoroughly bound, cloth back. "America" has lithographic views of several celebrated scenes in America.

BURNED OUT!

My bee-hive and section factory was burned to the ground Aug. 13. All orders sent will be filled as before. I will not rebuild, but buy and sell.

W. D. SOPER, Jackson, Mich.

Cash for Beeswax!

Will pay 21c per lb. cash, or 24c in trade for any quantity of good, fair, average beeswax, delivered at our R. R. station. The same will be sold to those who wish to purchase, at 30c per lb., or 35c for best selected wax.

Unless you put your name on the box, and notify us by mail of amount sent, I can not hold myself responsible for mistakes. It will not pay as a general thing to send wax by express.

A. I. ROOT, Medina, Ohio.

NOW IS THE TIME
FOR MARKETING HONEY, AND NEW YORK
IS A GOOD MARKET.

We make liberal advances in CASH on consignments, sell quickly at highest obtainable market prices, and pay the net proceeds IMMEDIATELY after honey has been sold. We charge for commission and GUARANTEE of payment, five per cent. Ship by freight to

F. G. STROHMAYER & CO.,
WHOLESALE HONEY MERCHANTS,
122 WATER STREET, NEW YORK.

KIND WORDS FROM OUR CUSTOMERS.

The scales and other goods came to hand all O. K. The scales are very nice, and are cheaper than we could get them here by having a merchant to buy them at wholesale.

MILLER BROS.

Bluffton, Mo., Aug. 1, 1889.

I received the bees in very good order and shape. The evening I received the bees, I put them in a hive, and next day the Ohio emigrants were working splendidly. Many thanks.

J. M. G. KALLISH.

East Portland, Oregon, July 27, 1889.

THE BUCKEYE SASH-LOCK.

The goods ordered from you came to hand in good shape. The buckwheat (Japanese) is up and doing well. I expect an immense crop. I never saw buckwheat stand nicer. The Buckeye sash-locks are nice. My mother says they are just the nicest things to fasten up windows. I wonder how you can sell them so cheap.

H. D. FRIEND.

Douglas, O., Aug. 10, 1889.

ONLY 20 BEES DEAD OUT OF A POUND, IN GOING CLEAR TO TEXAS.

The bees and queen came through safe and sound, not over 20 dead bees in the case. I could not find the queen at first, or I would have answered sooner. We have found her now. She is all right.

J. B. FULTON.

Dripping Springs, Tex., Aug. 10, 1889.

2000 EGGS A DAY, IN ONLY 4 DAYS AFTER GOING THROUGH THE MALES.

The tested queen I received from you was successfully introduced the 19th, and on the 23d I found her depositing eggs at the rate of 2000 per day. I also wish to say the queen you sent me is a very handsome as well as a very large one for a young one. Please accept thanks for prompt shipment.

Reinersville, O., Aug. 24, 1889.

J. E. PECK.

THE WHITMAN PUMP A TERROR.

The Whitman pump arrived in good condition. Thanks for your promptness. The pump is a jewel, but I don't know but I shall regret the day I got it, for in the hands of my little boy it is a terror. The cat, dog, chickens, his sister, and even papa, have to feel the force of that Whitman pump.

Dehesa, Cal., Aug. 23, 1889.

A. W. OSBURN.

DOUBLE QUICK.

I received my goods yesterday at noon. I think it was the quickest time on record. I wrote my letter and dropped it in the postoffice on the evening of the 20th, but it did not go out till the next morning. Your card states you received it the 22d, and I received the goods the 23d at noon. Who can beat it?

JOS. C. DEEM.

Knightstown, Ind., Aug. 24, 1889.

CHEESE AND HONEY.

The goods came to hand all right; and to say that I am pleased, would not near express my feelings. The goods all through are the nicest I ever saw. I have had but little time this year to devote to bees, as my work has been of such a nature that I could not give them any time except at night, as I have had charge of a cheese-factory, and we have manufactured from 500 to 600 lbs. per day; and, as you state in your last journal, my time was my employer's until night; however, I have increased from 24, spring count, to 70, and have secured all of 2000 lbs. of comb honey; so you see my bees were busy as well as I.

M. D. JOHNSON.

Webster, Ia., Aug. 15, 1889.

HOW TO TELL WHEN A WATERMELON IS RIPE, ETC.

I raised nearly \$50.00 worth of sweet-potato plants this year. I got every thing I know about raising them, from GLEANINGS. Market-gardening is not quite so glorious as with you. Our city has 3500 people, and only two or three market-gardeners; but the foreign farmers bring their produce, cabbages, etc., to the stores, and raise hovee with prices. Peas are only 60 to 80 cts. per bushel for American Wonder, and big lima, like Stratagems, at

that. I wish you would start people to writing about how to tell a ripe watermelon by sight. My hearing has broken down, and how can I tell when my Green & Gold's, White Gems, etc., are ripe? I wish Mr. Terry or Mr. Henderson could be heard on this point, as much loss comes from picking green melons.

M. S. BENEDICT.

Crete, Neb., July 5, 1889.

THAT SINGER SEWING-MACHINE.

I have received and tried the No. 4 Singer machine. It is not only a beauty, but does good work. We consider it a bargain. I must compliment you on being able to offer such a machine at so small a price. It gives entire satisfaction. I have 110 stands of bees. They have done very well.

Civer, Ill., Aug. 27, 1889.

JAMES F. NEWTON.

\$5.00 Secures a Home in the "Sunny South."

There has been placed in my hands for sale, 100 lots in a newly laid-out "city," in one of the most beautiful and healthful portions of Nature's great sanitarium—Western North Carolina, at prices ranging from \$5.00 to \$25.00 each, according to size and location. *Title perfect; warranty deed given.* Near the junction of two-trunk line railroads, one completed, the other nearly so; climate unsurpassed, winters mild, summers pleasant; *fine water*, beautiful mountain scenery, good soil; gold and other minerals in vicinity; building material abundant and cheap. Lots selling rapidly. Several farms for sale. For particulars address

HONEY COLUMN.

CITY MARKETS.

PHILADELPHIA.—*Honey.*—Honey in the comb is now arriving, and the demand increasing accordingly. We have advanced our prices, and feel confident of their remaining as quoted. We quote as follows: Fancy white, 1-lb. in neat cases, 17@18; same, 2-lbs., 14@15; fancy buckwheat, 1-lb. in neat cases, 12@13; same, 2-lbs., 10@11. Off grades of all kinds 1@2c less than above. Extracted is same as our letter of Aug. 15.

Sept. 5. WALKER & MCCORD,
32 & 34 So. Water St., Philadelphia, Pa.

COLUMBUS.—*Honey.*—Our market remains about the same for No. 1 honey in 1-lb. sections. Poor and off stock meets with slow sale, trade wanting fine white clover or basswood. The market on extracted honey about cleaned up; a shipment of that kind would meet with ready sale. We would advise all parties that ship to this market to ship by freight, as the charges are less, and goods come in better condition.

Sept. 9. EARLE CLICKENGER,
Columbus, Ohio.

NEW YORK.—*Honey.*—Good demand for both comb and extracted honey. We quote: Fancy white, 1-lbs., 16; 2-lbs., 14. Off grades, about 2c a lb. less. Buckwheat, 1-lbs., 11@12; 2-lbs., 9@10. Extracted, basswood and clover, 8; orange blossom, 8; buckwheat, 6@6½; California, amber, 7@7½; Southern, 65@70c a gallon.

Sept. 10. HILDRETH BROS. & SEGELKEN,
New York.

MILWAUKEE.—*Honey.*—The new crop of honey is coming in and is of very fine quality. The demand is fair, and values easy. Will quote: Choice white, 1-lb. sections, 14@15; second quality white, 12½@14; old 1-lb. sections, 10@12. Extracted white, in tins and pails, 8@8½; same, in barrels and kegs, 7@8; dark, in barrels and kegs, nominal, 5@6. *Bee-wax*, 22@25.

Sept. 5. A. V. BISHOP,
Milwaukee, Wis.

CINCINNATI.—*Honey.*—There is a fair demand for all kinds of honey. Arrivals of extracted honey are good, while good comb honey is scarce in our market. The latter sells at 11@16 in a jobbing way. Extracted honey brings 5@8 on arrival. *Bee-wax*.—There is a good home demand for this, which brings 20@22 for good to choice yellow on arrival.

Sept. 11. CHAS. F. MUTH & SON,
Cincinnati, Ohio.

BOSTON.—*Honey.*—Honey has arrived quite freely, and it has been the disposition of some receivers to sell. Owing to the warm weather, prices have had to be shaded. Our market to-day is: 1-lb. white, 16@18; 2-lb. white, 16@17. Extracted, 8@9. *Bee-wax*, none in stock. We look for better prices later in the season, and would not advise bee-keepers to rush their honey on to the market.

Sept. 9. BLAKE & RIPLEY,
Boston, Mass.

KANSAS CITY.—*Honey.*—The market is still slow. White comb 1-lb., 14@15; same, 2-lbs., 13@14; dark comb, 1-lb., 10@12; same, 2-lb., 10. Extracted, white, 7@8; amber, 5@6. *Bee-wax*, 20@22.

Sept. 8. CLEMONS, CLOON & CO.,
Kansas City, Mo.

PHILADELPHIA.—*Honey.*—The inquiry for No. 1 honey, 1-lb. sections, has begun. I imagine the price will start at about 13@15c, the latter being my usual starting price. Yellow *bee-wax* is in demand, at 23c.

Sept. 9. CHAS. E. SHOEMAKER,
44 So. Water St., Philadelphia, Pa.

NEW YORK.—*Honey.*—Extracted, California, orange bloom, white clover and basswood, 8c. Comb honey, 1 lb. fancy white, 16c; 1 lb., fair, 14; 2 lb., fancy, 14; 2 lb., fair, 12. Demand very good for first quality.

Sept. 10. F. G. STROHMEYER & CO.,
New York.

DETROIT.—*Honey.*—Very little coming in; demand slow. Best selling at 14@15c. *Bee-wax*, 24c.

Bell Branch, Mich., Sept. 9. M. H. HUNT.

CHICAGO.—*Honey.*—Honey is not selling very fast. We are now expecting trade to be better, as the weather has got colder. The market is well supplied, and sales are made in some instances very low. No lots can be sold at over 13@14c, and some less, if at all out of prime condition. Extracted 6@8; sales chiefly at 7c for best white in barrels or kegs. *Bee-wax*, 25; very little offered.

Sept. 10. R. A. BURNETT,
161 So. Water St., Chicago, Ill.

ALBANY.—*Honey.*—Market firm on all grades of comb honey; receipts now not equal to demand, and we think prices are now the best of the season. Comb, white, 16@18; mixed, 14@15; dark, 12@13; mixed, 12@14. Extracted, white, 7½@8½; dark, 6@7. Consignments solicited.

Sept. 8. H. R. WRIGHT,
Albany, N. Y.

WANTED.—200 or 300 lbs. of good extracted honey. Who will furnish it the cheapest, delivered at Brattleboro, Vt., or Greenfield, Mass.?

W. J. HILLMAN, Green River, Vt.

WANTED.—Several hundred pounds of white extracted honey, in 60-lb. square tin cans. Price must be low, because freight charges are very high to this distant place.

G. G. MEAD, Ferris, Wyoming.

FOR SALE.—One barrel of A No. 1 basswood honey, 550 lbs., at 7c, and 800 lbs. of honey-dew honey, at 5c. No charge for package.

H. O. McELHANY, Cedar Rapids, Iowa.

FOR SALE.—9000 lbs. of honey, in scant 1-lb. sections, crates holding 12 sections; will take 13c for white clover, and 11c per lb. for dark, f. o. b. here.

JOHN HANDEL, Savanna, Ill.

FOR SALE.—About 1000 lbs. of white clover and basswood each, of extracted honey; will deliver on railroad, in 60-lb. cans, for 8c per lb. I have also about 1500 lbs. of white comb honey in 1-lb. sections; will take 12c per lb., delivered on track.

W. R. HASLETT, St. Anthony, Iowa.

FOR SALE.—1000 lbs. extracted white-clover honey, at 8c per lb. This honey is in 60-lb. tin screw-cap cans; is well ripened and heavy. Will sell part or all, and deliver at depot here, at the above price.

R. B. LEAHY & CO., Higginsville, Mo.

FOR SALE.—6000 lbs. honey, 5000 white and 1000 dark. White honey at 7c per lb., f. o. b. here in barrels of 540 and 550 lbs. each; in tin cans of 60 lbs. each, 2 cans boxed together, at 7½c per lb. Dark honey at 6c. Shipped same as above.

ROBT. QUINN, Shellsburg, Iowa.

FOR SALE.—Quite a quantity of white clover and basswood honey, put up in 60-lb. square cans. Will take \$4.75 per can at my place. Correspondence solicited.

17-18d H. L. ROUSE, Republic, Iowa.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15c per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight.

OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.

17tdb

FOR SALE.—10,000 lbs. of choice white-clover honey, in first-quality 1-lb. sections, 24 and 48 lb. cases, delivered free on board cars at Dixon, at 13 cts. per lb. If you want 1000 lbs. or more, write for special prices.

17-18d EZRA BAER, Dixon, Ill.

FOR SALE.—25,000 lbs. choice extracted white-clover honey, in barrels holding about 550 lbs. net, each. I put it up also in packages of any size desired, in either wood or tin. There is no finer honey than this in the market. Write me what you want, and I will give you prices.

EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

OUT-APIARIES, NO. XV.

HAULING SECTIONS, ETC.

I AM sorry to say I know very little about what kind of conveyance others use in doing the necessary hauling to and from out-apiaries.

Probably each one uses just what he happens to have, and I should very much like to see a plan of a wagon specially gotten up for bee-keepers. As trips are made almost every day it is a matter of some consequence in what they are made. An easy-riding concern leaves you in better shape for work, and, for this reason, springs are important, even if they were not necessary for sections filled with foundation or honey. It seems to me it would be quite nice to have a cover over the whole wagon, so as to give shade from a hot sun, and protection from the rain. I should hardly like to start with a load of comb honey without some way of keeping it dry in case of a heavy shower. If a shower comes up while you are at work in the apiary it may be more convenient to run to shelter in a covered wagon than into a house or barn. Your wagon should be heavy enough to be sufficiently strong for the loads of honey you hope to haul, and it should be as light as possible, so you can make fast time on the road; for during the season, when every minute is precious, it makes a good bit of difference whether you go along at a smart trot or drag along at a walk.

If running for extracted honey, no preparation is needed for a bulky load; but if you run for comb honey, supers of sections will need more than an ordinary wagon-box to enable you to carry a good load. I say "supers of sections," for I presume your sections will be got ready during the winter or spring, and I use the word *super* in the most general way with its literal meaning, "over," to apply to any arrangement for holding surplus receptacles

placed over the brood-nest. It depends somewhat upon the kind of supers used, as to how you will carry them. If you discover no better way, you can increase the height of your wagon-box by using a modification of the rack that western farmers use for hauling hogs. Mine is made of common six-inch fence-boards; and to save weight, spaces are left between the boards, these spaces being small enough so there is no danger of a super coming through between the boards, and falling out of the load. Looking at the cut you will see that it is a very simple affair.

LIGHT TOP BOXES FOR HAULING SUPERS, ETC.

The two lower frames are held together by cleats nailed on the outside, these cleats continuing down over the outside of the wagon-box, thus holding the rack on. Stops nailed on the inside of the cleats keep the rack from fitting down close on the wagon-box, so that there is the same space between the lower frame and the wagon-box as there is between the two frames. The upper frame is a separate affair set on the lower rack, stops nailed on the inside of the cleats holding it up so as to make the space between it and the lower rack. The reason for hav-

ing the upper part of the rack separate, is that it is easier to put on the first part of the load with the upper rack off. After the lower rack is filled, then set on the upper one and fill it. When hauling the filled supers of honey home, there will be no need of the upper rack. The rack is short enough not to interfere with the wagon-seat.

While talking about hauling sections, I may as well speak of starters dropping out. If you use narrow starters you are not likely to have any trouble. Probably, however, you fill the section with foundation, in which case, unless very securely fastened, the starters may drop out in hauling. I used a Parker fastener, and turned the sections upside down when hauling. It was some trouble, but not so much as to have the starters fall out. Then I got a Clark fastener; and since using that, I haul the sections without inverting, and it is a rare thing for a starter to fall out. The Clark, however, must be used *correctly*, or I wouldn't have it. Simply press the foundation with a kicking motion of the feet, using no sliding motion of the foundation; and if the edge of your foundation is soft enough you will make a very secure job. C. C. MILLER.

Marengo, Ill.

Why, friend M., when you went around to the house-apiaries when I was there, you had a nice easy-riding buggy, with a top to it to keep off the sun. Was that only because I was along? I supposed it was the regular programme. I noticed, however, that you did not carry very many supplies in the buggy. We have quite a variety of top boxes for farm work, but none, perhaps, quite as light as yours. On our big lumber wagon, the front-board is permanently higher than the rest of the box; then to make the box higher we have some very thin light side-boards permanently attached to an end-board. This sits over the edge of the box, and catches fast to the front end-board. The idea of having a top-box in sections, so you can take off a part of it at a time, is a very good one. I suppose bee-keepers with out-apiaries will need something of an assortment of vehicles. Where you make a hurried trip alone by yourself, the common road cart, I should think, would be very nice, for you can make great speed without fatiguing the horse. Next would be a buggy or spring wagon, that would carry, say, 1000 lbs.; but when honey, hives, or bees are to be moved, weighing several tons, then I should think that two horses with a big stout wagon would be the best economy; and perhaps it would pay to have springs. By slow driving, however, one can get along without them. The number of out-apiaries, and the amount of business one does, would probably have to decide somewhat in regard to vehicles, and the number of horses also, for that matter.

NON-SWARMERS.

G. M. DOOLITTLE PROPOSES A PLAN.

BY page 631 of GLEANINGS for the present year, I see that Dr. Miller is still desirous of knowing how to keep bees from swarming, and quotes "Doolittle" quite largely in his article on that page. Doctor, please accept thanks for kind words found on the page above

quoted; and now I wish to lead you and the readers of GLEANINGS out in a new direction along this line of non-swarming, for Doolittle has been experimenting a little more the past summer on this vexatious question—vexatious to those who have all the bees they care for. Why I wish to give my experiment at this time is, so that you can prepare a hive or two the present winter to try the plan, and then with me, next summer, help perfect it to a greater extent than I have been able to do with all my cares. We have all heard of non-swarming hives during the past, yet none of these ever proved capable of doing what their inventors claimed for them, for which reason no one has any faith in a non-swarming hive. Well, I do not claim a non-swarming hive as any part of my plan, but I do claim that hive *preparation* and *manipulation* may yet be made the very item which is to do away with swarming, only as the owner has a desire for swarms. Now, after reading what is to follow, I want every reader of GLEANINGS to set his or her mind to work to see how they can improve on what I have done, hoping that each one may take a different line of thought from mine, or from any other person, and next season work out what they think, when, according to my belief, some of us will have a sure way of keeping all colonies from swarming, even if the plan I tried this year does not work as satisfactorily another year as it has this. What I did was as follows:

Last winter I cut three hives in two, so as to make two half-depth hives of each. I now made half-depth frames to fit these hives, which gave me a frame 5 inches deep and $10\frac{1}{4}$ inches long, inside measure. That your frames should be like mine is not at all important. To cut your hive through the center the up-and-down way, and make the frames to fit the hive, is all that is necessary to try the plan. I made the bee-space at the top of each part, but I do not know but it would work equally well with this space at the bottom. To get the bee-space at the bottom, I nailed $\frac{1}{8}$ strips on the bottom-boards, for the hives to rest upon. When spring arrived I transferred colonies into these hives, using only one part of the hive at first till the bees became strong enough to want the whole hive, when the other half was put underneath that part which the bees had occupied till this time. In other words, these half depth hives were tiered up as soon as they became strong enough to work to advantage in both parts. For this purpose I used the standard Gallup hive, rather than the hive holding only nine frames, which I use the most largely in my apiary, for my object was to get the largest force of bees possible at or just before the time of swarming; and by using the standard Gallup hive I could use 26 half depth frames, in both parts, when all were in the hive.

A little before swarming time, say a week, and as soon as honey began to come in so that the bees were building little bits of new comb, the part of the hive having the most sealed brood in it, or, in other words, that part having the least unsealed brood in, was raised off the other part, being sure that the queen was in the lower part, a queen-excluding honey-board put on, and on top of this a case of sections, while on top of the sections was placed the upper half of the hive which had been taken off. This was done to start the bees in the sections at once, on a plan somewhat similar to D. A. Jones's idea of putting the sections in the middle

of the brood-nest in an ordinary hive. They were now left till the brood in the raised part of the hive was mostly sealed over, when this part was set on a separate stand, after shaking a part of the bees out of it, if it was thought that they would have more bees than would be needed to take care of the brood after the old bees had returned to the old stand; then a queen-cell was given them, as I desired increase this season. If I had not so desired, this part of the plan would be left off, putting both parts above the sections, as about to be described.

Having the bees all in one part of the hive and in the sections, the next thing I did was to bring another half-hive, and, after taking the colony from the stand, this half-hive was set in place of that set off. This half-hive contained frames having starters only in them, said starters being about $\frac{1}{2}$ inch of foundation the whole length of the under side to the top-bar of the frame. The sections and honey-board were now removed from where they were, to the top of this new hive, and the passages down into the sections were closed by putting a sheet of enameled cloth over the top of the whole. The half-hive having the bees and queen was now opened, the queen found, and set out of the hive, when about two-thirds of the bees were shaken in front of the new part; and, lastly, the queen was placed with these shaken-off bees so she would be in the lower part of the hive where new comb was to be built. The part containing the brood and bees which were left to protect it was now set on top of the sections, over the enameled cloth, and the hive closed. These hives were worked inside of the shell of a chaff hive, the chaff being removed. In a day or two, an entrance was opened, which had been previously prepared, at the bottom of each part to the hives, so that the bees in the upper hive had to run down the sides of the section case and lower hive when they wished to get out, going in at the bottom of the lower hive, and out at the entrance. After having their playspell they would stay in the lower hive and in the sections, so that, when all had hatched, the upper set of combs was free from both honey and bees, when they were taken off and stored away for another season. Young bees enough seemed to remain to hatch the brood, while they went down into the lower hive just right to keep the colony at its strongest point all the while storing honey. The sections were tiered up as needed, or removed, and the bees seemed to think that they had swarmed, or at least they appeared to so think, after they were shaken into the empty part below. If an empty shell is not used, I would leave one corner of the enameled cloth turned back a little for the bees to pass through the sections down below; but in this case probably the bees might store a little honey in the empty combs after the brood had hatched. This has worked well this season, a season when not many swarms have issued, and I believe it will work in any season, giving us no swarms and lots of honey. I have time only to briefly outline it, but trust it will be sufficiently plain so that all can understand what the plan is, and help to perfect it still further.

G. M. DOOLITTLE.

Borodino, N. Y., Sept. 3, 1889.

I should expect the above plan to work, unless the bees had gotten the swarming mania before it was started. I am afraid, in such a case, they would swarm in spite of us. The objections to the plan are, that it

is a little complicated, and fully as much work, if I understand it correctly, as making an artificial swarm. Would not the final result be something like the plan so often given, of hiving the new swarm, and setting it on top of an old one, then in a few days destroying the queen-cells below and shaking the bees and queen in front of the lower one? In the above case the bees would probably conclude that they had swarmed, and therefore give it up until circumstances or the honey-yield should get them into condition to swarm again.

ARTIFICIAL INCREASE VERSUS BUYING BEES.

HENRY LARGE'S EXPERIENCE REVIEWED.

If no one else has criticised H. Large's experiment, page 618, Aug. 1, permit me to say, while it is worthy of notice as to the amount of increase possible, and also the amount of sugar necessary to expend to obtain that result, the balance-sheet itself is incomplete, and, to beginners, misleading. From the dates given in the article, I beg to submit an approximate balance-sheet, leaving out the question of time and labor, which, for the five months, could not have been obtained for less than \$50. And another point is not made quite clear, whether they were full colonies sold, or only three-frame nuclei—see page 618, right-hand column, 4th and 5th line. If the latter, then bee-keeping might be profitable.

	Dr.		Cr.
1 stock on hand ..	\$ 6 00	22-stocks at \$5.00 ..	\$110 00
44 hives at \$1.20	52 80	5-stocks at \$6.00	30 00
20 queens at \$1.00	20 00	18-stocks at \$5.00	90 00
Sugar	70 00	Sugar	2 00
400 sheets of foundation, say 50 lbs. at \$2.	21 00		
To balance	62 20		
	\$232 00		\$232 00

You will see that I beg to differ with you in charging the 20 queens. They should be charged, even if Mr. Large had them given to him; and hives also have to be charged, and also foundation, as per his letter.

Now, is the game worth the candle? I can buy colonies in February and March right here, and I have no doubt most bee-keepers can elsewhere, at from \$2.00 to \$3.00 per colony, and the cost of building up friend Large's 45 was \$1.75 each, exclusive of labor, hives, and foundation.

H. FITZ HART.
Avery, La., Aug. 25, 1889.

NEW METHODS OF QUEEN-REARING.

ZINC-EXCLUDERS, ETC.

An interesting question now before our leading apiarists is, Can young queens be fertilized from a hive where there is a laying queen in the brood-chamber, the queens being excluded from the brood-chamber and each other, and given separate entrances?

This matter has been considered in the *American Bee Journal*, see page 26, Vol. XXV., where a negative view is taken. That view is still held. While it may occasionally occur, as in a great honey-flow, or where there is a failing queen, still it is an exception to a great law in the nature of the honey-bee; and that law is, that, so long as a vigorous queen occupies the brood-chamber, she reigns practically supreme as regards all rivals. But if for any cause she deserts the brood-chamber for

another and remote part of the hive, and begins laying; or if she leads out a swarm, the conditions for queen-rearing are essentially changed. The bees of that brood-chamber will then start queen-cells, and, with proper mechanism, the bee-keeper may get every one of them hatched, fertilized, and laying, all in the same hive; at the same time, the bees have access to all of the queens.

Thus we may rear and get young queens fertilized from a hive while the mother-queen is actively depositing eggs in the same hive; but it is imperative that her operations be transferred to a part of the hive remote from the brood-chamber.

In storifying a lot of brood-chambers containing combs of honey upon a colony (without excluders to prevent the queens going up), I found shortly after that she had gone up to the third story, and the bees below in the first story had started queen-cells. The queen was laying vigorously, and her attending bees were flying from the first story and the only entrance.

This liability of the queen to leave the brood-nest will account for the probable fact that colonies of bees in caverns and other places in a wild state have many laying queens, although all of the bees are seen to issue from a common entrance. In no other way can we account for the large numbers of bees seen to fly from some of these wild colonies. In the instance above noted, of the queen deserting the brood-nest, I put her back in the first story; put on an excluder, and then the seven other brood-chambers I had on this hive. The bees then balled and killed the mother-queen, and raised a queen above and below the excluder.

In two other cases, where I had put swarms containing the mother-queen above the sections, the bees reared young queens below while the mother was laying above. So in this case, where the mother-queen had gone up to the third story, if I had left her there she would not have been disturbed, and there would have been two laying queens in a short time. But I have yet to record a single instance among many cases I have had in the last three years, of a young queen becoming fertilized from an upper story above an excluder, where there was a laying queen in the brood-chamber.

One of the many plans of using the new queen-rearing chamber is to take the old queen from a hive and put her in an upper story, above an excluder, or, wait till she leads a swarm, and hive in the usual manner; then place all above the excluder. Before the queen-cells are ready to hatch, set the combs over the new chambers, so that there will be one cell to each of the compartments, and all of the young queens that hatch will become fertilized, and begin laying in due time.

The many and highly successful uses to which queen-excluding zinc may be put, hails the advent of great changes in our methods and fixtures. My prediction on page 88 of GLEANINGS, Vol. XVI., see the three closing paragraphs, will speedily come to pass, and other much-needed changes with it, not the least of which will be the sacrifice of the present largely used Langstroth brood-frame for one of a smaller size, or one about 7 x 17 inches. The new conditions and requirements brought about will compel these changes, which are destined to place bee-keeping upon a more successful and profitable basis. It will be soon made to appear, if it is not already apparent, that bee-keeping, as a pursuit apart from other business, is not a

profitable one (barring a few exceptions in favored localities), with our old methods and fixtures for handling bees. The new system, with its larger returns and financial success, will work its own way to popular favor.

G. L. TINKER.

New Philadelphia, O., July 27, 1889.

I proved by some expensive experiments years ago that queens can be hatched and fertilized in a colony having a laying queen; but said colony required a degree of watching and manipulation that made it out of the question to raise queens at a profit. If we could develop a strain of bees where young queens would be raised continually, while their mother kept on laying eggs, then we should have what we want.

THE HONEY CROP OF VENTURA CO., CAL., AND VICINITY.

FRIEND MERCER GIVES US THE FIGURES.

IF your correspondent from Los Angeles Co. still thinks we shall have a fair crop of honey, I think he had better dust around among the bee-keepers and learn what is going on; for there is less than one-fourth of a crop in all of the southern part of the State. The crop has mostly been sold for about 6 cts. per lb. The comb honey crop was nearly an entire failure. There was only about 3 tons produced in Ventura Co.

L. E. MERCER.

THE REESE BEE-ESCAPE.

AN EXCEEDINGLY IMPORTANT INVENTION.

IN my work in the apiary this summer there is nothing I have used with greater satisfaction than the Reese bee-escape. This was illustrated in GLEANINGS somewhat over a year ago, I believe, but since then so little has been said of it that it does not seem to have come into general use. With me it has proved not only a labor-saver, but has largely done away with one of the most unpleasant operations of the apiary. The usual way of ridding extracting combs of bees is to remove the combs separately, shake the bees off as much as possible, and then brush off those remaining.

With many bee-keepers, comb honey is handled in about the same way, except that things are often made worse by handling each section separately. This shaking and brushing bees from the combs is a tedious, wearisome, dauby, and exasperating task. The nice comb honey is uncapped by the bees while the operation is going on; irritated bees take revenge on the operator, and often robbing is the natural result of the exposure of honey. All supers, whether for comb or extracted honey, should be of such construction and size as to be readily handled as a whole. Any form of super that must be taken to pieces to remove the honey from the hive is defective. With properly constructed supers the removal of honey by means of the bee-escape is an easy matter. The finished super is removed, a bee-escape placed on the hive, and the super and cover replaced, alarming the bees scarcely at all, requiring the use of but little smoke, and allowing almost no chance for robbers. In a short time the bees will have quietly passed below, and the honey may be removed. Usually I put the bee-escapes on in the forenoon, and remove the honey late in the afternoon, or put them on in the evening, and leave them over night. Very often less time will answer, but usually it is well to allow six or eight hours for the bees to get out. When sufficient time can be allowed they are just the thing for an out-apiary.

I use single cones, making them two inches in diameter, and the same in depth. A form for making them is easily made from wood. Sometimes the bees cluster on the cones in such numbers that some find their way back; but this does not often happen. To prevent the possibility of leaving the escape on so long that combs will be built in it, it should be painted some color strongly contrasting with that of the hive.

Those who use hives with a double brood-chamber can use the bee-escape to very good advantage in preparing their bees for winter. Wait until all brood has hatched, then remove the lower story, and run the bees out of it through a bee-escape. The upper story contains most of the honey, the lower story nearly all of the pollen, and your bees are thus contracted for winter in the best possible shape, and without handling a frame, and with very little contact with the bees at a season when manipulation is particularly difficult.

Dayton, Ill., Aug. 27, 1889.

J. A. GREEN.

You certainly have succeeded in making the bee-escape a great labor-saving implement; and as I read over what you have to say, I felt ashamed to think that this had not been brought out so prominently before.

As an illustration: In our experiments with the house-apiary we came to a point where we decided that, if some method besides shaking and brushing could be devised to get the bees off the combs and sections, it would be a success. But we decided then that it could not be done; and unless you have tested the matter thoroughly, I am inclined to think that the bees will, many times, stick to their combs day after day (especially if the combs contain a little brood). The only way in which we succeeded in getting them to leave entirely has been to wait for cool weather, and sometimes even then they would stick to the supers until they became too stiff to move. Your idea of having the escape painted some different color from the body of the hive is a bright thought. A great many times, very annoying omissions can be prevented by simply having tools or implements painted with contrasting colors. You know we have our covers for sap-pails red on one side and white on the other, so as to tell when a pail has been filled. You will remember that I mentioned that Dr. Miller piled his honey up in tall piles, in order to get most of the bees to leave of their own accord before he came to finally getting them out.

AMONG THE BEE-KEEPERS OF VERMONT.

POINTS OF THE JOURNEY SUMMED UP.

AFTER a Sunday in Rutland, spent both pleasantly and profitably, we went to Bradford, where lives Mr. Hilos Davis, a bee-keeper and hive manufacturer. This place is east of the picturesque Green Mountains, between White River Junction and Wells River, and near the New Hampshire and Vermont line. The location is not equal to the region across the mountain, for honey production. As Mr. Davis was obliged to leave his business on account of failing health, he came here in 1878, and began bee-keeping. He commenced in the spring, with 278 colonies, and then had 310 in three yards three or four miles apart. In the home yard, situated on quite a steep hillside, were 96 colonies. These are cared for by a young lady member of his family, Miss Lucy Crehose, who is enthusiastic in the work. At the factory, three miles away, where Mr. Davis owns a nice little water-power, are 150 colonies which he looks after. Mr. Davis was a designer and inventor, and was with one firm in North Andover, Mass., in this capacity ten years. His factory here was burned a few years ago, and he lost not only much stock and valuable machinery, but a large number of the finest tools which can not be replaced, having been made and collected during his former occupation. The present factory is well fitted with improved machinery, adapted to making hives, sections, crates, etc. He is a skilled workman in wood as well as iron, and the goods turned out are well and accurately made. He has made a number of different hives, and experimented on and invented various fixtures. His present hive is very ingenious, with many good points; but in our opinion it has so many complicated and accurately fitted parts that the labor required to manipulate it would be a great objection in a large apiary. He

uses eight Langstroth hanging frames, which are held at fixed distances by projecting pieces at each end of the brood-chamber. The surplus case consists of section-holders with a double wood separator fastened on one side. These are held together by a wooden frame; the side or end boards are wedge-shaped, and the frame is crowded up tightly about them. The double separator is his invention, and has become favorably known to quite a number of bee keepers. It is claimed for it, that, as bees can go through these passages they do not walk over the combs as much, and it saves their being stained, and also gives freest access to the cases above. The same crate is used as a feeder, shallow troughs taking the place of the rows of sections, while the bees enter through the passages between these separators. In winter, the brood-chamber is turned on end, making the shallow frames into deep ones. An outer case, similar to Manum's, is used, and packing is placed beneath as well as around. The fresh air passes up between the case and an inner partition, and enters the brood-chamber near the top, when, he claims, it falls to the bottom and forces out the foul air through the porous cloth at the top, and all condensation of moisture is prevented; there is also no draft on the cluster.

He has invented and is testing an ingenious automatic swarming arrangement. It consists of a brood-chamber, containing combs with wire cloth on one side. It is set on end on a shelf or bracket on the front of the hive. A passage leads to it from the entrance, and the outer entrance is covered with queen-excluding zinc. When the swarm attempts to leave, the queen can not go through the zinc, and either finds her way to the catcher, or returns to the hive. If the apiarist is on hand as soon as they begin to issue, he shuts the lower entrance entirely; and the swarm, led by the light, pours up into the catcher. When clustered, the brood-chambers are changed, the new one put inside the hive, and the cases of sections from the old one are given them, and the work goes on. The old swarm is left then until united or given a permanent stand. His experience with queen-excluding zinc is, that the Jones and Falconer zinc does not hold the queen every time. Last season the third apiary was in charge of Mr. Davis' daughter, a bright child of eleven years. She managed every thing, with the help of a man near by, who would lift clamps of honey, or do any heavy work when called upon. In going to the yard she walked a quarter of a mile to the station, took the train to the next station, walked two miles to the apiary, and when the day was over she walked the whole distance home. Sometimes she had a chance to ride home with her father, who came to see how she was getting along. The past two seasons have been very poor with him, and Mr. Davis is "living in hopes" of something better soon. In 1885 his best hive gave him 197 lbs. of comb honey, and did not swarm. When he has a good crop he takes a lot by freight to the different cities and sells it himself. Sometimes he takes a wagonload to the nearest large places.

After a short stay here, owing to our limited time, we took leave of the family in which was such a promising young bee-mistress, and were driven to the station by Mr. Davis, when, after thanking him for the pains he had taken for us, we took the train and were safely delivered in Pawtucket that evening.

In summing up our trip we have learned so much that is both new and valuable to us that we are at a loss to mention the most important helps; but we would say we admired the tireless energy and practical ability possessed by Mr. Manum, as shown in the simplicity and completeness of the hive used, and in the systematic arrangement and management of his extensive apiaries.

At Mr. Crane's we saw the section-crate that won us (also used by Holmes and Larrabee and others), and noticed that he was able to get along with less help during the season than the others who allowed their bees to swarm; and we decided to try removing queens from part of our colonies the coming season. Manum and Crane fasten a hook to the bellows of their smokers, which is hooked over the edge of the hive and holds it convenient for use, or so that smoke from it may blow across the open hive.

At Mrs. Wolcott's was the best honey and work shop for 150 colonies we have ever seen, and the most attractive cases of comb honey ready for market, the credit for which is due to Mr. Holmes, we believe. At Mr. Holmes' home yard was the finest finished as well as the cleanest prepared sections of comb honey we have ever seen. His bees are blacks, with a few hybrids.

All the parties visited used the four-piece dove-tailed section, made of white poplar, glued at the corners when put together. This is what we have used for several years, and we should like to see any thing stronger, whiter, or squarer. We have driven them together with a block of wood, after touching the corners in white glue, and then put them in the angle of a carpenter's square to leave them true. There they use various machines for putting them together. Mr. Manum used to make and sell a lightning gluer, which was attached to a horse, similar to a harness-maker's, but it is now used somewhat changed, and is attached to his work-bench. Nearly all in Addison County have made something on the same principle, and "which does the work."

Mr. Isham, one of Mr. Manum's apiarists, has an attachment for his machine, with which foundation is mashed into sections with ease and incredible rapidity. These machines we think should be more generally used.

Mr. Forbes picked up a wagon-spring, cut off part of one end, fastened a square piece to this thick end, and bolted the thin end to a block fastened to his bench, then attached a treadle to pull it down with, put in a stop beneath, to prevent it coming too far, and I don't see but he has the simplest and cheapest arrangement of all.

Larrabee, Holmes, Hall, Forbes, and others, have the Barnes improved foot-power saw, and make all their hives, crates, and shipping-cases with it. Outdoor wintering is practiced almost exclusively in the region, though Mr. Crane has lately started the practice of wintering in the cellar.

If any one should have secured any help from ideas given in these articles, we are glad; but these bee-keepers deserve the credit of it, and we would advise all who can to take the trip themselves, for very likely they will be better able than we were to improve the opportunity. SAMUEL CUSHMAN.

Pawtucket, R. I.

Friend C., we are glad to get reports from any bee-keeper who manages to have his sons and daughters assist him; and your

account of the way in which a daughter eleven years old managed an apiary is really wonderful. I presume that, of course, friend Davis will watch carefully to see that the child is not overtaxed, either mentally or physically. She is just the age of our daughter Caddie; and while we were talking it over at the breakfast-table, Caddie thought it was a pretty big undertaking. As a rule, where children do show special gifts in such matters, they ought to be allowed to have vacations quite often, and of pretty good length. Any little girl who loves her father, and who also loves bees, can oftentimes do surprising things in this line. It reminds us of the story of Katie Grimm, and the wonderful feats she performed in the way of extracting honey in one of her father's out-apiaries. Some of the younger ones might very naturally want to know how big pay Miss Davis received for her share of the work. The accounts of your visits have been very interesting indeed.

CUBA AND ITS HONEY RESOURCES.

THE NATIVE CUBAN APIARIES AND HIVES.

A NATIVE Cuban apiary usually consists of from 50 to several hundred log gums, each 10 to 18 inches in diameter, and 5 to 6 feet long, lying flat on the ground or on poles, in rows about 2 feet apart, and open at both ends, from which the combs often protrude a foot or more. The shell of these palm logs being very thin, dry, and free of limbs or knots, is easily and quickly split open in transferring. The tools used in this operation consist of a smoker, long-handled ax, whisk-broom, and a long iron rod with a handle at one end, and flattened at the other into a broad gouge, sharp and circular in shape, to conform to the inside surface of the gums. Two blows with the ax, directed between two long rows of combs, usually suffice to divide the hive into halves. We now remove with knives all the large and heavy combs of honey and brood, and, after jarring off the bees, finish up with the long gouge, leaving the shell as smooth and clean as though the bees had never occupied it. When the day's transferring is done, all the brood-combs are gathered into one place at the entrance to the hive of a strong stock; here it is carefully arranged into a long pile, and covered with palm bark and coffee-sacks. We now close the other end of the strong stock, and thus compel the bees to pass through this pile of brood in leaving and returning to their hive. In a couple of weeks the brood is all hatched, and we have millions of bees to use when needed, besides plenty of old combs to turn into foundation, which, by the way, I prefer to any very old combs, no matter how straight and nice they may appear. In this manner we have, with an assistant, transferred an apiary of 86 gums into our hives in 4½ days, which, when we consider that the gums will average in their contents twice as much as the old box hives of this country, must be regarded as rapid work. The honey-flows at this time of the year, January and February, are so plentiful and constant that no trouble is experienced from robbing.

THE TWO MAIN SOURCES OF HONEY.

While most of the trees, shrubs, and plants, bloom

profusely, and the larger part furnish honey, yet the apiarist in this part of the island relies for his large crop of surplus mainly on two sources—campana, or bellflower, and the campeachy (logwood). The former is a vine, much resembling our morning-glory, and blooms profusely from December till in February. It is considered a perfect pest by the Cuban farmer, as it grows almost everywhere, and is difficult to kill out. The latter is a beautiful wide-branching tree with a most peculiar body, often nearly square instead of round, like an ordinary tree. It blooms three times during the year; and each time, for the space of about two weeks, it affords large quantities of rich golden nectar, in quality and color much like the honey from the pumpkin-bloom. When in bloom the hum of the bees among its branches can be heard quite a distance, and reminds one of the basswood forests in this country, except the large tresses of flowers, which are yellow instead of white.

NO WINTER PROBLEM TO CONTENT WITH.

Here in the North the great problem of safely wintering and "springing" the bees occupies the thoughts of our apiarists, while in Cuba the problem is, "how to have our hives overflowing with bees at the commencement of the great honey-flows," commencing in December. August, September, and a portion of October, are probably the worst months in the year for the Cuban bee-keeper. There are flowers in bloom, but they do not seem to afford much honey. The Italian queens diminish wonderfully in their laying capacity, and the blacks to a less extent. To solve as nearly as possible this problem we use hybrid queens; and as our hives are large we place a close-fitting division-board in the center, and as good and prolific a queen as we can find in each part, adjusting the entrance so the bees will not mingle on the alighting-board. We now give them a very little *thin* feed each evening, continuing till near November, when we remove one queen, take out the division-boards, and place all the brood in the lower stories of the hives; and as honey is now coming in moderately, feeding is discontinued; and by December we have, say, on an average, from 60,000 to 80,000 bees to each hive, and this means an average, at least, of from 350 to 500 lbs. of honey. I know of one large hive containing a Syrian queen, which gave an average of 600 lbs. of honey for three successive seasons. I will now give our method of wiring foundation.

ANOTHER PLAN OF WIRING FRAMES.

Punch two holes in the *side-bars* of the frame, equally distant from the top and bottom. Place a small tack on the outside of one side-bar, near each hole. Now, facing your work-bench, with frame in left hand and wire reel fastened to the bench on your right, insert the wire in the upper hole, across the frame, parallel with the top-bar, through the upper hole on the left side, then back through the lower holes. Now securely fasten the wire to the upper tack, and pull the lower wire very tight, and fasten to the lower tack; clip them off and drive home the tacks, and you are ready to insert the foundation, which should have a play of not over $\frac{1}{16}$ inch from side to side. Tack a board on your bench, which fits the inside of your frame, and of half its thickness. Place the sheet of foundation on this board and bring the frame down over it so that the wires rest tightly against the foundation. Now with a small awl, with groove in the point to ride the wires, imbed them in the foundation; and if the

work is properly done, no sagging or breaking of combs will occur in extracting. I have thoroughly tested this method, and believe it superior to any other; besides, it is inexpensive, simple, and speedy.

Of course, there are some "drawbacks" to Americans carrying on business in Cuba, but they are not so serious as many suppose, and these we may notice in some future number. A. J. KING.

New York, Aug., 1889.

Well, I declare, old friend, you have really worked up almost a system of bee culture specially for Cuba. Your plan of placing all the brood in front of a strong colony, so as to have a regular storehouse of young bees from which to draw them, by the pint, quart, or bushel, is a new idea, at least to me. By this means we get all the brood, and get rid of transferring old combs into frames that would be only a detriment. I think if I should do any transferring I would adopt a similar plan; viz., save all the bees, but melt up every square inch of comb from the old hive. Your plan of wiring frames, I presume, applies particularly to the American frame, about a foot square. For this frame it will no doubt answer nicely. With the Langstroth frames, two diagonal wires work very well in a similar way. We should be very glad indeed to receive further reports.

COAL OIL AND SULPHUR NO REMEDY FOR FOUL BROOD.

SOMETHING FROM OUR OLD FRIEND JOHN G. COREY, OF SMOKER FAME.

IN a late issue of GLEANINGS, I see that Bro. Mercer, our foul-brood inspector, has gone back ten years and is now actually going over the same ground that some of our old Ventura County bee-keepers did during our foul-brood panic, commencing in 1877.

I am sorry this old coal-oil and sulphur remedy has been revived, and doubly so because it re-appeared in this county, where we, like a band of brothers, united in reading up on the subject, and finally united, and, I can safely say, stamped it out of existence among the progressive bee-keepers of this county. 'Tis true, we had *bee-owners* who would experiment with coal-oil and sulphur, the same as the celebrated African "medico," who prescribed "rosom and shot" for a broken leg, and foul brood stuck to them like a brother as long as they owned a single colony of bees. But our wide-awake bee-keepers accepted the well-established theory that the disease existed in the *honey*; and that, as long as there was a drop of that diseased honey in a hive, foul brood was liable to re-appear whenever that drop of honey was used to feed brood; and as Bro. Mercer is our inspector, we feel a pride in having him both practice and teach the true and accepted theory, namely, that foul brood is a fungoid disease, and exists in the honey; that the diseased, dead, and putrid brood is only the effect; that to cure the disease we must remove the cause. Still, I am willing to hear Bro. Mercer defend his coal-oil and sulphur remedy, but I can not feel otherwise than that any such nonsense is misleading, and eventually works a great wrong. When beginners in bee culture read the discussions on this disease, and examine the best authorities

on the subject, and afterward find a large bee-keeper advocating so simple a remedy as Bro. Mercer proposes, he is liable to say, "What a set of old fools those old bee-keepers were, to make so much ado about such a trivial affair as foul brood!"

I can tell Bros. Mercer and McIntyre how to make a queen-excluder for one-third of a cent, if it would not be considered too cheap, and be an injury to the perforated-zinc trade.

JNO. G. COREY.

Santa Paula, Cal., Aug. 13, 1889.

Friend Corey marked the following "private;" but as it contains the good news that he is about to enter into our ranks again, he will excuse us for using it.

P. S.—Bees came and entered some of my old cast-away hives on my lot. I have cared for them, and imported some queens, and am preparing to go back into bee-keeping this winter. I have been lonesome since I sold my apiaries, and I can't live without bees. J. G. C.

Perhaps I should explain to our readers, that friend Corey is the one who first gave us the idea of the cold-blast smoker. I had quite a visit with him while in California, and he explained to me that, as his life has been mostly spent with machinery, making him necessarily conversant with the principles of steam, air, and liquids, it was no very great invention for him to suggest making the smoker on the injector principle—at least he so states it. But we can thank him none the less. He is a man well informed, and well calculated to detect and throw out any so-called false science. If he uses a remedy or any thing at all for foul brood, it would have to have the stamp of common sense on it before it could pass him. I entirely agree with him in regard to the coal oil and sulphur—that is, I can not see by any process of reasoning how it should be an antidote against foul brood.

WHAT IS AN AVERAGE CROP OF HONEY, COMB AND EXTRACTED?

E. FRANCE BRINGS UP A PERTINENT QUESTION.

IN answers to the third question in the statistical report in Aug. 15th GLEANINGS, for the present year, there appears to be a big difference in opinion as to the amount of a full crop of honey. We base our calculations on a full crop of extracted honey as 100 lbs. per colony, spring count; and for comb honey, 50 lbs. per colony. This year we got about 50 lbs. average, which we call half a crop. My report for this vicinity was 75 per cent; but my neighbors got more honey per colony than I did. Mr. Freeborn, of Ithaca, Wis., gives 100 per cent; his crop 32,000 lbs. from 300 colonies, an average of 107 lbs. per colony, besides 200 lbs. of comb honey. Mr. F. McNay, of Mauston, Wis., gives in his report 100 per cent; his crop 20,000 lbs. from 350 colonies. His average was a trifle over 57 lbs.; but still he reports 100 per cent. See the difference in opinion about per cent. McNay must think he got a full crop, while Freeborn doesn't appear to think he got over a full crop. Mr. J. L. Clarke, of Florida, reports nearly 5000 lbs. from 68 colonies, an average per colony of 73½ lbs., and he reports 200 per cent. Mr. C. Dadant, of Illinois, reports 35,000 lbs. from 400 colonies, 87½ lbs.

average per colony, and he reports 150 per cent. Mr. James Heddon, of Michigan, reports 2000 lbs. of honey from 200 colonies, an average of 10 lbs. per colony, and he calls it 25 per cent. Mr. R. L. Taylor, of Michigan, reports 4000 lbs. of comb from 400 colonies, and he says 25 per cent. Mrs. L. Harrison reports 2000 lbs. from 75 colonies, an average per colony of 26 $\frac{2}{3}$ lbs., yet she says 100 per cent. Mr. W. P. W. Duke, of Alabama, reports 3000 lbs. of comb from 40 colonies, an average of 75 lbs. per colony, yet he says 200 per cent. Mr. Chas. F. Muth, of Ohio, reports 800 lbs. from 28 colonies. He says his per cent is perhaps 75, and his average is about 28 lbs.

Now, friends, it is amusing to look over the reports and note the difference in the per cent reported. The most of these that I have quoted are prominent bee-keepers and writers on bees and honey. But just see the difference of per cent quoted on the amount of honey taken. What does this "per cent" business amount to? If we had

them. Perhaps the reporter has done better than those about him, or the case may be just the reverse. I believe, however, that the parties you mention generally do a little better than others in their vicinity, for they are leading bee-men.

PRATT'S QUEEN-REARING APIARY.

CARNIOLANS, ETC.

THE engraving herewith shows the northeast corner of what is known as the "Pratt Bee Farm," of Marlboro, Mass. This apiary is wholly made up of the Carniolan race of bees, and is run for queen-rearing exclusively. It is located in the center of a city of 13,500 population. A small brook is in the background. The large hives in the foreground are stock hives, of the Cary type. The first three or four rows contain imported queens, and they are constantly

PRATT'S QUEEN-REARING APIARY.

nothing but the per cent report for a guide, our conclusions as to the amount of honey taken would be as wide as the rate of per cent quoted. But fortunately we have the pounds of honey taken and the number of colonies, and that is valuable.

Now, friends, can we not settle on some amount of honey, both for extracted and comb, so that we all may know just what is meant by a full crop of honey? We often read about a crop, half a crop, one fourth crop, etc. Let us call a full crop of extracted, 100 lbs.; comb, 50 lbs.; then every pound of extracted is one per cent, and of comb honey two per cent. We ought to have a standard.

Platteville, Wis., Aug. 28, 1889. E. FRANCE.

Many thanks, friend France, for calling us all to order in this matter. I would, however, suggest that possibly the friends, in mentioning the per cent, have in mind the general product in the vicinity around

drawn upon for brood to strengthen nuclei, etc., which keeps them from swarming.

Those hives just to the left of the operator contain the finest breeding queens procurable. These bees will submit to rougher usage without anger, and will endure the severest weather with less risk, than any other bees that we are familiar with.

In the distance, among the grass, are shown a few of the nuclei hives—one hundred in all.

These hives all take the Cary frame, with ten to the large and from three to five to the nuclei.

The operator is your humble servant. He is just opening an imported-stock hive, without the use of smoke, during a clover harvest.

During this season, 1889, not a single queen has been lost at mating time, out of the hundreds reared. This is on account of vigor of the young Carniolan queens, keeping all nursery hives a good distance apart, and allowing the grass to grow up

about them. All the breeding is done from very fine home-bred queens, and mated with the finest drones from tested imported stock. We are firm believers in breeding from the best drones as well as from the best queens. E. L. PRATT.

Marlboro, Mass.

Perhaps our readers may not all recognize friend Pratt as the editor of the *Queen-Breeder's Journal*. The picture seems to indicate that his apiary is a very pleasant place, and one would hardly think, from the view of the shrubbery, that it is in a city of 13,500 inhabitants. The descriptive letter above sounds pretty strong for the Carniolans, as well as for the skill of the proprietor; but it may be well, perhaps, to bear in mind that friend Pratt is an enthusiast in the matter of queen-rearing. He has certainly gone beyond anything within the scope of our experience if he has raised hundreds of queens without losing one during mating time. As we are told that the *Queen-Breeder's Journal* has been recently sold to another bee-paper, we infer that the business of queen-rearing was too arduous and exacting to admit of conducting a periodical in regard to the subject at the same time.

JOTTINGS BY AMATEUR EXPERT.

THE TEMPER OF CARNIOLAN BEES.

IN a recent issue of GLEANINGS, Ernest remarked that a stock of Carniolan bees placed in the care of a Mr. Harrington were not more docile than Italians. I should like to say, that plenty of them are not so; but on the whole they are a far more amiable race, although they can sting if need be, and are good at defending their homes. They need very little smoke, and do not rush about on the tops of the frames during manipulation. They are very still if you handle them carefully, and they do not rush into balls, especially at the lower corners of the frames, as some bees do. On the other hand, they never seem to gorge so excessively as many bees, which makes it difficult to change them from one hive to another, or run them in at the entrance, as one sometimes wishes to when uniting or adding to a stock. But all this is running away from "temper."

The question I wish to broach is this: If I get a queen from a dealer who warrants her as from a quiet strain, why are her progeny more or less savage? I suggest, chiefly two reasons: 1. Because, probably, she has been reared from the egg by savage nurse bees; or, 2. After you get her you probably introduce her to a stock of very cross wretches, because you hope to improve their tempers. I believe there is a little in the first reason, but there is far more in the second. We know the effect of a foster mother on a child. True, children bred on goats' milk do not butt; and if on asses' milk they do not work their ears backward and forward when they talk, although they may do many characteristic things when they grow up; but many a weakly child from a weakly parent has grown into a finely developed adult through being brought up by a physically strong foster mother, and has inherited many of the physical and moral characteristics of the parents and family who has nurtured them in childhood, instead of those of its natural parent. I beg that lady's pardon, but I mention her name to draw

her out of her silence. What has Mrs. Chaddock to say to this? Well, if this is true of men, and how much more true of animals, why not bees, who have such control over the future of a bee through the quality of the milk given it when young? So much for theory. Now for a fact or two:

I have a friend who is a very enterprising bee-keeper; he is one of the first to get hold of every new race; he makes his bees pay him well; he has had every conceivable kind known; and the consequence is, he has an apiary full of hybrids, and, to use his own expression, they are all "naughty." He has had Carniolans, and from several dealers too; but even his Carniolans are the most savage I ever met with. He has introduced his queens to savage hybrid stocks to cure their tempers, but only to find the young Carniolans are only a shade "less naughty" than his young hybrids.

Another bee-keeper, who sells bees with Carniolan queens introduced, always finds the first batch of Carniolan brood is not nearly so amiable as those following later, and he confessed to me it has been a great drawback to him. On one occasion I lent an old tough-combed stock, in a straw skep, for manipulation at a bee-show, in a tent, and a very noted bee-keeper complained of their bad temper, killed the queen, and gave me a nice young queen from a very quiet race, and I was disappointed to find her progeny were not much improved on those of her predecessor in the way of stings, but that same old stock afterward got to be as quiet as any, and I took it to many shows, and it did not seem to make them as bad as the original bees were, although they had plenty of drumming and knocking about.

THE QUESTION OF THE YELLOW BANDS.

Some say they are not a pure race. Of this I am not able to speak with authority. I have had them, and seen them in other apiaries for the past nine years; and although I have seen others' bees breed yellow bands, mine have not, and this year I have tested the progeny of from 40 to 50 queens purely mated, and have had no yellow-band breeders. There are two things I have remarked; and that is that, while many of the queens are as yellow as Italians, others are very black; but it does not seem to affect the color and markings of the progeny; the second is more curious still; and that is, the presence of a few workers, say one in about 1000, with their abdomens a jet black, and so smooth that, at first sight, the rings are scarcely discernible. They work as well as any, and their heads, legs, and thorax, are like their fellows'; but these black bodies look very strange. Now you will kindly give me credit for not mistaking them for the black, hairless, shiny bees, which we often see being expelled from their hives, and are suffering from a disease known as *hacilli depletus*, and are often mistaken for robbers. The bees I allude to are not those. I have given some other facts about this race, and also some of their vagaries, elsewhere in another bee-paper, consequently I will pass on.

SECTIONS BUILT OUT WITH COMB THE PREVIOUS YEAR.

If you wish these to be finished as fast, and look as well as others, you must, with a keen and warm knife, pare them down to within nearly half an inch of the midrib before you put them on; they will still act as a bait to draw the bees into the super, and will be built out with the other sections, and look as well.

DOUBLE-DECKED COMBS.

I have had two cases of this occur in two of my supers this year. They are bars $4\frac{1}{2}$ inches deep, and spaced 2 inches apart instead of $1\frac{1}{2}$, and the bees first built out the combs to the ordinary thickness, and sealed them, and afterward built another row of cells on the sealed surface of one side of the comb, and filled that with honey, and sealed the cells the second time. I discovered it when I came to extract, but the bases of the outer row of cells were flat, not natural based, as illustrated in GLEANINGS for April 15.

EXTRACTING FROM COMBS THAT HAVE BEEN USED FOR BREEDING.

Breeding in the combs toughens them considerably, and they will bear the extractor much better; but the color of the honey is not so fine, and the bees are far more disposed to store pollen in them than they are cells that have not been bred in. The top corner cells of the frames in the brood-nest are, I may say, never bred in. Did any one ever see any pollen stored in them? Consequently I do not use frames for extracting if they are pollen-laden and brood-stained the previous year. I have to be very careful over my honey, as I have a good private trade, and command my price. I can make one shilling per section of the comb honey, and the same price per pound for the extracted when put up in white flint-glass bottles. I do not mind telling you, as you are not near me to compete with me for price, I allow a storekeeper, who sells about half my crop, 15 per cent discount for his trouble and risk, and am usually cleared out by Christmas.

I am well content with my harvest, although I have sold lots of bees to a dealer who took as many swarms and queens as I cared to sell, consequently I allowed them to swarm as they chose, and even my nuclei stored surplus some days while the queens were getting fertilized. I have had 200 acres in my radius, of white and alsike clover, and the largest tract lay to the northwest of my bees, and they have had to cross a high road to get at it, and I have been called out by passers-by, who have insisted they were swarming, as they boom backward and forward after this clover honey.

Nature has evidently righted the mortality of last year by causing bees to swarm excessively this year, and the good yield has induced many faint-hearted ones to hold on and not give up yet.

England, Aug., 1889.

AMATEUR EXPERT.

My friend, I quite agree with you in the point you make, that gentle bees may be taught to be cross, and *vice versa*. I have several times been inclined to conclude that young bees were vicious simply because of the example before them from childhood up; notwithstanding, I have several times killed the queen of a cross hybrid stock, just because they were so vindictive. In fact, I have had hives that were the terror of the whole family; but after giving them an Italian queen I have astonished the whole family by taking the hive all to pieces and showing them only gentle Italians where, but a few weeks before, had been those stinging tigers. I have seen these occasional black bees, but I always supposed they were stragglers that were driven from some other colony, although that explanation never seemed satisfactory.—I think the idea has been before advanced, that honey from old dry combs is not as

nice as that extracted from white new combs. I believe, however, that where experiments were made for the purpose of getting at this matter directly, just as fine honey was obtained from the old combs as from the other. Any admixture of pollen, however, is surely detrimental.—I am very glad indeed to hear so good a report from clover sown purposely for bees—at least I suppose it was, as you state it.

McINTYRE'S SCALE-HIVE RECORD.

DOOLITTLE'S METHOD OF RAISING CELLS.

I INCLOSE my scale-hive record for this season. You see it differs from Mr. Mercer's, page 619, in being longer at both ends, and my best honey days do not come on the same day that his do. I believe his scale-hive was located about 20 miles further from the coast than mine. If those scale-hive records are as interesting to others as they are to me they are worth printing; and if the hive has not been packed to make a big report, they tell very accurately what a location will do. This was one of my best colonies that did not swarm.

My average for 500 colonies was only 50 lbs. per colony.

QUEENS AND QUEEN-EXCLUDERS.

I put on 25 queen-excluders last month to try Doolittle's method of rearing queens; 5 colonies refused to build the cells, although I gave them the second batch of prepared cells. One queen got above the queen-excluder, and the cells were torn down; the rest built out the cells in good shape. I intended to let the young queens supersede the old queen below, so I left a cell to hatch in each super, which it did in due time; when the young queens were about a day old I removed 15 excluders. Two days after, I looked in front of the hives to see if the old queen had been killed. Instead of finding the old queens I found all of the virgins, but one, dead in front of the entrance. The one I did not find, superseded the old queen. The other 5 were left above the excluders, to become fertilized through a hole in the super; but they were all killed.

Although this part has failed with me, I still feel under great obligations to Mr. Doolittle; for I never before succeeded in getting queens that suited me, from eggs or larvæ intended for workers. Queens reared in the brood-chamber of a colony preparing to swarm or supersede their queen are better than

those reared above a queen-excluder; in fact, I don't think we can improve on the plan of going to a colony that is preparing to swarm or supersede their queen, cutting out all the queen-cells they have started, and giving a frame of started cells from your best queen. I have over 100 queens in my apiary, reared this season in that way; and they are nearly all superfine xxx queens, and I don't regret the time spent in rearing them.

Fillmore, Cal., Aug. 26, 1889. J. F. MCINTYRE.

And so, friend M., you had only one day during the season when the hive gave as much as 9 lbs. You surely have not had a very bountiful season. It seems a little singular that your honey-yield commences pretty nearly as ours does here—at least not very much earlier; and it closes toward the middle of July, just as it does here in Ohio, as a rule. Where such an experiment is made, it were no more than fair to state how many colonies there are in the apiary, and also how many in the vicinity, that we may see how fully stocked was the field.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

RAISING QUEENS ABOVE QUEEN-EXCLUDING HONEY-BOARDS, AGAIN.

Several years ago a question of priority of a certain discovery pertaining to bee-keeping arose in a western bee-paper, wherein one of the claimants gave plenty of printed proofs of his claim, yet he was misquoted, misrepresented, and misused, till he began to think that, if he ever made any future valuable discoveries, he would use them to his best interests and let others find them out as best they could. Still, I believe there are some who are willing to give "honor to whom honor is due." In GLEANINGS, page 685, it is conceded that Heddon has the oldest claim on raising queens over a laying queen. His writing dates back to 1885. See GLEANINGS, page 518. Now, will you please turn to GLEANINGS for 1883, page 13, to my article under date of Dec. 18, 1882, headed "Two, Three, or More Laying Queens in one Hive"? nearly three years ahead. I believe this is essentially the same principle that Dr. Tinker has just got a patent on. Next!

A. A. FRADENBURG.

Port Washington, O., July 25, 1889.

Friend F., I have just turned to the passage you mention. I had not forgotten it at all, nor my foot-note to the communication. Why I did not mention it at the time I gave Doolittle credit, was because *you* succeeded in getting only *one* of the queens fertilized, and this at the time seemed to be rather accidental. That is, I have been well aware for years that I could get an extra queen in almost any hive about one time in three, by making the brood-nest larger or cutting it nearly off, as you did, by slipping back the cloth cover; and I am inclined to think even now that there will be so many failures, queens will not be reared and fertilized to any great extent above the queen-excluding honey-board. I have before suggested the difficulty, when you want to examine the brood-combs in the hive below. Some one

says it can be done without any trouble. Well, I had a great deal of trouble when I experimented in this line. The queen belonging to the upper story would sometimes take wing when the upper story was set off on the ground, and alight in the lower story while I was handling it. Now, unless I got the hive together again, and got her back where she belonged, there was trouble. I should much prefer to have a part of the brood-chamber divided off by a queen-excluding division-board, and then either one can be examined without interfering with the other. But this idea was given by D. A. Jones when he first brought the queen-excluding zinc so prominently before the attention of the American people. It seems to be the old story over again. It is hardly safe for anybody to say in bee culture, "This is my invention." When it comes before the public, it transpires that a dozen others have been at some time or other working along in the same line, and very often the thing has been described very closely in print years before.

BEES TEARING DOWN STARTERS, ETC.

How high do Alaska peas grow?

Do you have any trouble with bees eating the starters in section boxes?

Where bee-keepers cage the queen to prevent swarming, what kind of cages is used most?

Monroe, N. Y., Aug. 8, 1889. MILLARD MAPES.

Alaska peas grow to about the height of two feet.—Bees will sometimes, when they have nothing else to do, eat away starters in the section boxes. They rarely do this, however, and you need apprehend no serious trouble from this source. With flat-bottom foundation we have sometimes noticed the bees tear it down and rebuild it.—For caging queens in the brood-nest during swarming time, no particular cage is used. Perhaps as good as any thing is a piece of wire cloth folded into a cylinder, one end of which is stopped by a wooden plug, and the other by a plug of "Good" candy. This latter should be protected so that the bees of the colony can not get at it, otherwise they will liberate the queen in 24 hours. Dr. Miller never places any food in the cage, and I think has never found a queen dead.

BLACK BEES FOR BUCKWHEAT, AND ITALIANS FOR CLOVER; WHICH ARE THE BEES THAT GATHER THE WHITE HONEY?

The two bushels of Japanese buckwheat I got of you I sowed June 20th on four acres. June 29th there came a terrible hailstorm and cut nearly all of it down. I did not think there was enough left to stand on ten rods square of ground; but it has come up to nearly a quarter of a crop. I was looking over it this morning, and the bees were fairly roaring over it; but they were nearly all black bees. I saw but one Italian on it, and two or three hybrids. I then examined the white clover. The bees were working lively on it, and nearly every one was Italian. I saw two black and a few hybrids. I wish others would examine and see if bees are working the same way in their locality. I have 29 swarms of Italians, 2 or 3 of blacks, and 13 hybrids, within 100 rods of the buckwheat, while my neighbors have plenty of black. One correspondent writes that

bees worked very little on the Japanese, while they were fairly swarming on the silverhull. From what I can learn by observation, tastes differ in the different races of bees. I should like to know if there is a difference in the quality of honey made by the two races; and if so, which is the best? In looking over my bees last week I saw two queens in each of two hives—one old one and one young one. I knew the old ones, for their wings were clipped; but they were much smaller than the young queens. Is it a common occurrence? E. S. HANSON.

La Otto, Ind., Aug. 7, 1889.

It is not uncommon to see black and hybrid bees gathering dark buckwheat honey, while Italians are gathering light honey from clover.

HONEY-POISONING IN NEW ZEALAND.

I send you a clipping from one of our papers, on honey-poisoning. It is the first case of the kind I have heard of in New Zealand. THOMAS DIXON.

Masterton, New Zealand, July 12, 1889.

A few days ago a northern telegram gave particulars of a remarkable case which had occurred near Matata, in the Bay of Plenty, where three brothers, who had gone into the bush in search of honey, were poisoned, and two of them died. It was supposed that this fatal result had been because they had eaten of honey which contained some poisonous ingredient. Mr. Hopkins, who is our best authority on the subject of bees and honey, wrote to the New Zealand *Herald*, stating that the only plant which had ever been known to convey poisonous qualities to the honey was the wharangi, but it could not have caused these deaths, and, besides, this was not the season when the bees could gather any thing from it. Mr. R. de Thierry has given the *Herald* some important information on the subject. He states that on one occasion he was traveling along the sea-coast with some Maoris when they fell in with a store of honey accumulated by some wild bees. Mr. de Thierry and one of the natives ate heartily of the honey as they found it. Soon after Mr. de Thierry was affected with giddiness, and fell down, feeling very ill. The native who had eaten with him was similarly affected. The Maoris promptly adopted remedial measures, such as they had probably tried before in similar cases. They kindled a fire, piled some seaweed upon it, and held Mr. de Thierry amongst the fumes till he became so sick that he vomited freely. By and by he got better, and the native, under similar treatment, also recovered. Mr. de Thierry says that the poisoning arises from the bees having access to the karo (*pittosporum crassifolium*), a tree or shrub which grows all around the coast of New Zealand. At a certain season a kind of gum exudes from the karo, which the bees use for the wax of the combs. The poison is in the wax, not in the honey. This matter is of importance, for bee-keeping is now general, and the karo is being generally planted, as it makes a pretty and useful hedge. It can stand any amount of stormy weather, and also the spray of the sea.—*Evening Post*, Wellington, New Zealand.

SHALL THE BEE-KEEPING INDUSTRY BE REPRESENTED AT THE WORLD'S FAIR IN 1892?

It is now a pretty well-understood fact, that in 1892 we are to have a grand "World's Fair" in New York, and in that case it is important that the exhibit of bees, honey, and supplies, be the finest ever seen in this or any other country. A grand exhibit of this kind would do wonders in increasing the market for honey, and would do our whole industry a world of good. Let us therefore put our shoulders to the wheel by recommending some one to act exclusively for our industry, on the proper committee, and have an exhibit that will show the world that we are the foremost nation in bee-keeping. It would be well for our conventions to recommend some one who has the welfare of the whole industry at heart, and who is within reach of

the city. If the several conventions will send me their recommendations I will see that they reach the proper authorities, as I am constantly in New York. I have already written to the Mayor, urging the appointment of some one to look after bee-keeping and bee-keepers' supplies; but the recommendation of our different conventions would be of far greater weight. Let us start the ball rolling, and we shall see such an exhibition in our line as was never seen before. JOHN ASPINWALL.

Barrytown, N. Y., Aug. 26, 1889.

Your suggestions are good, friend A., and we heartily indorse the scheme. Why wouldn't Dr. A. B. Mason, the president-elect of the N. A. B. K. A., be the man? He has had more experience in this line than any one else we know of. He is big enough in every sense of the word to talk down the comb-honey slanders. Let's vote for the doctor.

A CHEAP SUBSTITUTE FOR ENAMELED CLOTHS, ETC.

In a late issue of GLEANINGS you say that the bees will always cut out paper. I have used manilla tag-board, 100 sheets, 24 x 36, 100 lbs., worth \$2.25, for a number of years, for covers, in place of covers or enamel cloth, and I very much prefer them. The bees never cut them unless I am careless and let them get at the edges, by leaving, say, ½ inch bee-space. I paint the board with oil and ochre. From the above you will see they are cheap. Several issues back you speak of sulphur. Have you tried melting it in an iron kettle or ladle, and dipping in it strips of strawboard or several folds of coarse wrapping-paper? This was the way my grand-parents used it in England, and I have failed to have an improved way pointed out. Nail one or two uprights on a block; set the block on something not combustible; lay in the sulphur; match and fumigate as you wish.

Our bees are doing the best they have done for a number of years; though our best harvest (golden-rod and fall flowers) is not yet opened.

Emmetsburg, Ia.

J. C. BENNETT.

No doubt, manilla tag-boards as heavy as you mention would answer the purpose nicely. They are very apt to get injured, however, and can not be peeled over the frames like the enamel cloth, and therefore they have not found much favor.

RAISING CELLS ABOVE A QUEEN-EXCLUDING HONEY-BEARD; WHO HAS THE PRIORITY OF THE IDEA NOW?

In the spring of 1882 I adopted a plan of artificial swarming by shaking the bees off the combs on to frames filled with foundation, and placing the brood in a third story on top, or over the wide frames. I found, by cutting out the ends of the wide frames, that enough bees would go up to care for the brood, and that they would build queen-cells every time. I used a queen-excluding honey-board over the frames in the lower story. I communicated the above facts to Mr. W. J. Rasin, of Jenkintown, Mont. Co., Pa. (since deceased). He wrote to Mr. Heddon, asking his opinion of the plan. Mr. Rasin told me that Heddon did not think very favorably of it. I am not sure, but I think he also wrote to Mr. Hutehinson about it. I mentioned it in a letter to Doolittle, and I also wrote to you, stating that I would describe the method in an ar-

ticle for GLEANINGS, if desirable. Not receiving any response I came to the conclusion that you did not think it worthy of note. I can furnish affidavits of two other bee-keepers in this locality, to whom I communicated the facts, and who have practiced this method for four or five years.

Ashbourne, Pa., Aug. 23, 1889. W. E. FLOWERS.

MUMFORD'S CLOVER-BLOAT REMEDY A SUCCESS.

A. W. Mumford's remedy for clover bloat (see p. 672) is good, I know, as I have practiced it for several years. I had a cow some years ago that would have the bloat nearly every day when first turned on clover. She got so she would come to the barn when first taken, seeming to know she would get relief. I had a stick about a foot long and $1\frac{1}{2}$ inches through, with a cord on each end, in a handy place; and when she came up I would put it in her mouth like bits, and tie it back of the horns and let her go. In a short time she would be all right. It has never failed with me. If used in time I think it will cure any case of bloat. S. H. MALLORY.

Decatur, Mich., Aug. 24, 1889.

Thanks, friend M. Your testimony settles the question in regard to the value of this simple mechanical remedy. The above may have been published in our agricultural papers, but I have never come across it.

EXCESSIVELY HOT WEATHER IN CALIFORNIA.

We are having the hottest weather this season, since 1885. One day the thermometer went up to 114 in the shade. I ventilated my bees early in the morning, and did not have any melt down; but some of my neighbors were less fortunate, and lost a number of colonies entirely, by melting. If you never experienced such hot weather, it is interesting: the perspiration starts from every pore; and the only way to keep cool is to keep your clothes wet. Every thing in the house feels hot, even the marble on the bureau; and wife says the wheel on the sewing-machine almost burns her hand. You feel like saying, "Excuse me," when asked to take a chair. I kept the lawn-sprinkler running, and every half-hour the children and myself would go out and stand under it until our clothes were wet through. It would be foolishness to try to work out in the sun, for the thermometer says 134 out there, so I will sit in the house and work the typewriter. I put a wet cloth around the thermometer to see how much it would go down. It went from 114 to 80. That is nature's way of keeping the blood cool; but when the thermometer is 114 I prefer to pour the water on the outside rather than take it inwardly. J. F. MCINTYRE.

Fillmore, Cal., Aug. 24, 1889.

Friend M., we are very sorry that it was so hot; but we are much obliged to you for your valuable report and suggestions. You ought to be thankful for that beautiful irrigating canal that runs just back of your ranch, along the mountain-side, away up above the tops of your orange-trees. I think I could stand 114 very well, if I could have a spray of that beautiful spring water playing constantly over me; but I am greatly astonished to find that a wet cloth could reduce the temperature from 114 down to 80. Give my respects to the little girl who beat Uncle Amos climbing the mountain, and carried her dolly besides.

ANSWERS TO QUESTIONS FROM OUR A B C CLASS.

This department is designed primarily to cover questions either not already answered in the A B C of Bee Culture (price in cloth \$1.25), or, if incorporated in this work, are here dwelt upon more in detail on account of the importance of the question. While these answers are of vital interest to the A B C scholars, they will doubtless be found, in many instances, to be of considerable value to the more advanced student. For lack of space, the question itself, instead of being directly stated, is omitted, the same being implied in the answer. It is hoped that the class will first consult their text book before sending in their questions.

THE CHARACTER OF HONEY-DEW.

F. C. F., *Massachusetts*.—Honey-dew is not necessarily fatal for wintering, but it is usually safest to extract it or remove such combs containing it, and use them during the latter part of spring for feeding. They are just as good for stimulating brood-rearing. Honey-dew is usually dark, almost black. The flavor is very unpalatable—almost sickening. See "Aphides," also "Honey-Dew," in the A B C.

HOW TO START IN BEE-KEEPING THE MOST ECONOMICALLY.

M. D. S., *Massachusetts*.—We would not advise you to buy a black queen with Italian bees. Your better way is to buy an Italian queen with black or hybrid bees. This will in time give you a very nice Italian colony. The cheapest way to start an Italian apiary is to purchase two or three swarms of black bees; catch and kill their queens and introduce to each an untested Italian from some good breeder. If you can not purchase the black bees, the next cheapest way is to buy a pound of Italians with an untested Italian queen. Put these on some frames of foundation, and give them stimulative feed, and in two or three months you will have a pretty respectable colony to go into winter quarters.

SURPLUS POLLEN IN COMBS, AND WHAT TO DO WITH IT; WHEN THE BEES WILL PULL OUT FOUNDATION.

C. N. L., *Michigan*.—We would not advise you to cut out the pollen in the frame, and insert in its place comb foundation. As there is no practical way of getting it out of comb mechanically, keep such combs over till next spring, when they will be quite valuable for stimulating brood-rearing. As it is desirable to get colonies as strong as possible for the honey-flow, which comes later, these combs containing some pollen will save quite a little in the way of stimulative feeding. It will be very much cheaper to use frames of foundation, rather than to mutilate combs containing pollen. The best time in the year to have foundation drawn out is when honey is coming in. As a general thing, bees will not pull it out at other times, except under the stimulus of feeding.

H. L. S., *Ohio*.—You might choose bee-keeping as a means of livelihood, but you must be prepared to stem over now and then a bad season, when the returns from the apiary or apiaries would barely if at all cover expenses. It is usually safer to combine some other pursuit with bee-keeping, if the locality is not always to be depended upon for honey. Whatever you do, we would advise you to make a small beginning. By all means make the bees pay the expense of all needed improvements consequent upon their increase. As to which branch of bee-keeping will pay best, the production of extracted or comb honey should be settled by your

market. You can transfer safely now, although you will have to be careful, on account of the large amount of honey in the combs, to keep robbing from getting started. A six-inch saw would answer your purpose for hive-making. Of course, a larger one would be many times convenient.

OUR QUESTION-BOX,

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 143.—*a. Jones prefers hybrids because they are as good or a "little better" workers than the pure Italians; and, further, because he can shake them (the hybrids) off the combs easier, for extracting. Besides all this, he says it is considerable trouble to keep Italians pure. Brown does not agree. While he admits that the hybrids are, as a general thing, as good workers as the pure daughters of Italy, he prefers the latter; because, as they are less inclined to sting and rob, he can get through with more work in a day. He avers that the time gained in handling gentle bees more than compensates for the extra trouble and expense in keeping the race pure. Now, the question is, whose side would you take? b. Whose side do you take in actual practice?*

a. Jones; b. Jones.

H. R. BOARDMAN.

I side with Brother Brown, every time.

C. F. MUTH.

a. Jones. b. Jones, Jones, JONES.

P. H. ELWOOD.

My bees are mostly pure Italians.

S. I. FREEBORN.

In theory or actual practice I take Brown's side.

P. L. VIALLO.

Brown's side, every time. We are always sorry when we neglect to keep up the purity of our stock.

DADANT & SON.

Brown's side, as I find that the dark Italians are as good workers as hybrids, and they are equally hardy.

A. E. MANUM.

a. Jones's side; yet my dislike of so much stinging, and my love of the beautiful, have led me in practice to follow more after Brown. R. WILKIN.

a. As a honey-producer, I am with Jones; as a queen-breeder, with Brown. b. In practice I have only hybrids between Carniolans and Syrians, with, quite likely, some Italian and some German. So far as I have got, I like my present bees.

A. J. COOK.

a. Brown is right; while some hybrid swarms are as good workers as the Italians, I do not think they will average as good; besides, there is the pleasure and comfort of handling gentle bees. b. Brown's; my "other half" says, "Durn the hybrids."

MRS. L. HARRISON.

a. Brown's. b. Brown's, as near as I can; but I question whether, in ordinary practice, it pays to supersede every queen not absolutely pure. All good methods can be carried to an excess, and judgment has to be used in this as well as in many other matters connected with bee-keeping.

O. O. POPPLETON.

a. I prefer the hybrids, or a bee that will show two bands, and many three bands. They look well and work well. I have had very bright Italians, and the results from them were not so satisfactory. I take but little pains to keep my bees up to a gold

en standard. I am discarding the shaking and brushing plan for something better, where even cross hybrids keep their temper. b. Jones.

RAMBLER.

Both my theory and my practice favor the hybrids. I dissent from the theory that hybrids are specially vicious, so far as it concerns carefully bred ones. I think, also, that the reputation of the Italians for gentleness needs a good deal of discounting—their gentleness being a matter of appearance rather than of reality. I fear that very gentle bees of any race will be found deficient in energy.

E. E. HASTY.

I think Mr. Jones's main reason for preferring hybrids is the one least emphasized—"considerable trouble to keep Italians pure." There is little difference between some hybrids and Italians generally. Italians sell better, and are a little nicer to handle. The working qualities average up about even with hybrids. On the whole, for practical purposes I would not take the trouble to keep them pure; and this is what I practice.

GEO. GRIMM.

Now look here. You're not going to get me to side with either. For a number of years I have tried to increase the Italian blood in my apiaries; but without a good deal of trouble there will be plenty of hybrids, and I think well enough of them to take very great pains to be rid of them. As to the matter of gentleness, I take them as they come; only when some colony shows a bad pre-eminence in the way of crossness, their queen's head comes off at the first convenient opportunity.

C. C. MILLER.

a. Brown's. Jones is certainly mistaken, in my opinion, in regard to hybrids being better workers than Italians. If he will weigh all the honey in all parts of the hive from either race, he will find, if I am not very much mistaken, that there will be a little amount in favor of the Italians, especially in a poor season. Because the hybrids put all of their honey in the sections, thereby leaving them in a starving condition after the sections are taken off, does not make out that they are the best workers. b. After trying all the different races of bees which have come to our shores, I have now nothing but Italians.

G. M. DOOLITTLE.

a. I'd take Jones's side; but I want some pure bloods to raise queens from. I don't raise drones (I guess I will this year, though, in spite of myself, for the bees are playing hob with the lower corners of most combs), and not one in five of my queens is purely mated. b. Jones's. My hybrids are not so cross as many write about. I have opened the hive of every colony I have, and examined them at least once each week, since March 24th, and have used smoke only twice on a few colonies. I generally, but not always, wear a veil, and I've been stung but little. The crossiest colony I have has an imported Italian queen from A. I. Root. Do you know him? May be my bees are good-natured because I don't scold them.

A. B. MASON.

a. Jones; b. Jones. Our bees are, most of them, more or less mixed Italian and blacks, or brown bees, and the nearer they come to being pure brown bees, the better I like them. I have several Italian queens from queen-breeders, and I had two imported Italian queens, and I never had a strain of Italian bees yet that were as good natured as the

blacks. All the Italian bees that I have had have been cross, and ugly to handle. We are now going to try the Carniolan bees, as they are recommended to be less inclined to sting, and I believe they will be more gentle than the Italians, as they look more like the brown bees. As for myself, I can handle any of them without gloves or veil; but other folks have to be about them, and for that reason I want good-natured bees. E. FRANCE.

a. I agree with Brown. I think that Italians are as good as hybrids in all respects, and, in some points, as those mentioned, a great deal better. Cross bees certainly cost a great deal of time, to say nothing of comfort and temper. I am not fond of shaking and brushing bees off the combs for extracting. I would rather let them crawl off. The Reese bee-escape does the business, and saves time, trouble, and stings. b. In practice, hybrids are always to be found in my apiary, because there are black bees around me, and I do not think it worth while to replace a good queen simply because she is mismated. Nearly all my queens, though, are reared from selected Italian stock. My breeding queens are selected, not because of the looks of themselves or bees, but principally because of the work their bees do. Yellow bands do not gather honey. J. A. GREEN.

a. Although I am a strong advocate of judicious crosses between the best strains of German and Italian bees, I do not prefer such bees as Jones describes. Judicious crosses (call them hybrids if you will), while they shake from the comb more readily, they do not leave the combs when the hives are opened, and fly into the air and roll down in balls at your feet any more than pure Italians. Again, they differ from Jones's hybrids, because they do not sting or rob any more than any other bees extant. If these crosses were not as good natured as any other good working strain of bees, I would say, get the good-natured strain and discard the others. The above is my practice. I know of no bees any more easy to handle, nor as good honey-producers, nor as excellent comb-builders, as the cross-bred bees above described. JAMES HEDDON.

Well, friends, I am a little bit surprised, and may be somewhat disappointed in your reports, especially as so many side in with Jones. There is one point, however, where I should agree. The man who destroys good queens simply because the workers have not all the marks and stripes to accord with his notions, seldom becomes very much of a honey-producer. We meet such individuals now and then. What I mean is, those who lay great stress on looks and markings, and little or none on other qualities as honey-gatherers. In visiting the great honey-producers I almost invariably find they have more or less hybrids; but their colonies are all populous, and most of them are great workers. Another thing, one must have a good deal of time to spare who watches the markings of bees of every particular colony when he has stocks by the hundred. A great many honey-producers also, if I am correct, are in the habit of destroying queens where the bees are exceedingly vicious; and they do this, too, even if said vicious colony gives extra yields year after year. It is true, that blacks as well as Italians occasionally give us very gentle

bees, and the reverse is also true. I can not remember now, though, that we ever had a colony whose queen was imported from Italy, whose bees were so cross that we regarded them as a nuisance. Dr. Mason, are you sure that you did not "scold" that colony of imported bees? You should have written right back to A. I. Root, that he was an impostor and a fraud, because he sent you a *hybrid* queen when you ordered and paid for an *imported* queen.

QUESTION 144. a. Which bees, as a general rule, give the most honey according to your experience—leather-colored Italians, or the very yellow bees? b. Are the so-called four-banded golden Italians any better workers than the average Italians?

a. Leather-colored. b. No.

RAMBLER.

a. I think the leather-colored Italians deserve the preference; b. No.

GEO. GRIMM.

a. The leather-colored Italians; b. No, not as good with me.

A. E. MANUM.

a. Leather-colored; b. Not according to my experience.

A. J. COOK.

a. Leather-colored, part black. b. I don't know them.

P. H. ELWOOD.

a. The leather-colored Italians, every time. b. No, not that I know of.

JAMES HEDDON.

a. The leather-colored. b. No. As a general rule they are not much better workers than German brown bees.

PAUL L. VIALLO.

I never saw much difference in the honey-gathering qualities of bees as to color. b. I never had any.

E. FRANCE.

a. My experiments have not been sufficiently accurate to justify an answer in favor of one or the other.

R. WILKIN.

a. The dark Italians, or a cross between the yellow and black bees. b. I think not.

H. R. BOARDMAN.

a. I have not made close enough observations to have a decided opinion. b. I don't think I ever had any four-banded bees.

C. C. MILLER.

The brightest Italians are good enough for me. But the greater propensity for honey-gathering among those mentioned above is imaginary, according to the best of my judgment.

C. F. MUTH.

a. I have not got that conundrum answered yet, in my own mind. When I do I will report. I have two swarms of very yellow bees, that are certainly very fine in every respect.

MRS. L. HARRISON.

Very yellow Italians may be very good if they have not been bred "in and in," with sole regard to color, as is too often the case. For this reason we feel safer with the leather-colored bees.

DADANT & SON.

a. My first experience with yellow bees was not satisfactory. I have had for some time very light bees that are equal to any in color for honey. b. I know nothing about the four-banded Italians.

S. I. FREEBORN.

The leather-colored Italians. The stock I prefer is neither very dark nor very light. The yellowest bees I ever saw were also about the poorest workers. Some strains of these yellow bees produce comb honey with dark cappings. I would not keep a queen which produced such bees, in my apiary,

There are Italians which produce as nice comb honey as the blacks, and I aim to keep only such.

J. A. GREEN.

a. In Northern Iowa the light Italians gave me the best honey-yields. b. I have had no experience with the four-banded golden Italians, but I presume they are only a very light strain of pure Italians.

O. O. POPPLETON.

a. The leather-colored. b. My prettiest, that is, very yellow bees, are my poorest workers. A few years ago I bought a beauty of an imported queen of A. I. Root. Her progeny were perfect beauties, and all just alike, and she kept the frames full of brood, but they did not swarm, and gave no surplus, while the apiary of 75 colonies, this one included, gave an average of 60 pounds of basswood honey to the colony.

A. B. MASON.

'Spects that "leather-colored Italians" is mostly a nice, gentle term for a well-established strain of hybrids—imported bees by no means excepted from this remark. If you want Italians, get Italians. Then if you want them mixed, mix them yourself. I have owned but few colonies of very yellow bees; but I think very bright color is sometimes accompanied by lack of energy. The four-banded Italian is an "animile" I am not familiar with.

E. E. HASTY.

a. According to my experience there are three strains of Italians in this country—the dark, or what is called "leather-colored;" the orange, and the light yellow, or lemon-colored. Of these I place the orange-colored first; the leather-colored second, and lemon-colored third. b. Why say "so-called"? Bees either show four golden bands on the horny scales to the abdomen, or the person saying they do is telling that which is fallacious. If said four-banded bees are as good workers as any of the others, are we not a point ahead in keeping them? for, surely, A. I. Root places a higher price on queens of beautiful yellow color than he does on the dark ones. Hence, according to Root, such bees are the best, if they are as good honey-gatherers, which I claim they are.

G. M. DOOLITTLE.

Well, well! There seems to be far more unanimity in this matter of leather-colored Italians than in the former question. Scarcely one favors very handsome bees as honey-gatherers; and yet what a deal of wrangling there has been in years past over this matter of nice-looking bees! I have found men who laid so much stress on the looks of the worker-bees that they would refuse to take a queen as a gift, because the stripes were not just according to their notion, paying no attention to the fact that the queen might be extraordinarily prolific, or that the bees might have gathered a wonderful crop of honey. As a rule, however, the large honey-producers are not of this class of people. Our good friend Dr. Mason seems bent on pitching into A. I. Root to-day. Doctor, what did you do with that imported queen whose bees were such beauties, and just alike? It must be that was a strain of some sort of aristocracy that did not propose to labor for a living. We have occasionally had colonies of very handsome bees that were also excellent workers, and several times I have been tempted to decide that bees for honey are, pretty nearly all, ugly to handle.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: Sheer Off, Silver Keys, The Giant-Killer; or, The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room. We have also Our Homes, Part I., and Our Homes, Part II. Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

SOMETHING ABOUT BEARS, WOLVES, AND OTHER WILD ANIMALS.

WRITTEN FOR THE JUVENILES, BY UNCLE AMOS.

WELL, little friends, I have not told you a story for quite a spell; at least, I have not written any thing specially for your department; but I have had one in mind for some little time. When I went to visit that great bee-man, Mr. E. France, I found one of his out-apiaries away back in the woods. They are all located near some farmhouse, as a matter of course; and when I came near this special farmhouse there were several things that attracted my attention. The first thing was a brood of beautiful little ducklings. While friend France was unhitching his horse I looked over a low fence and saw those little ducks in charge of a speckled hen. The children had given them a trough of water, and, oh my! how that old hen did sputter and worry because the ducks jumped into the water and splashed about, just as if water was ever so much nicer than air during that summer afternoon! Pretty soon a very nice little girl came out to look after the ducks, and I began to get acquainted. By the time friend France had got around, the little girl's mamma came up, and Mr. F. introduced me as Mr. A. I. Root, probably not thinking that Mrs. Craven had ever heard of such a man as I. At the mention of my name, however, she uttered an exclamation of surprise, and replied:

"Why, this surely can not be A. I. Root, the author of the A B C of Bee Culture?"

Then I pleasantly told her it was. Friend France expressed surprise that they were acquainted with the A B C book, as they were not bee-keepers themselves at all. She replied that they once belonged to a horticultural society, and among the books purchased for their library was the A B C. When their society disbanded, the books were divided up, Mr. Craven and his wife receiving the A B C book, which, although they owned no bees, had been read till they

felt quite well acquainted indeed with its author. Then she blew a tin horn, and her husband dropped his work in the fields, and came in. While we sat down to a good substantial farm dinner, he looked at me smilingly, and remarked: "Well, I never expected it would be our good fortune to have Mr. A. I. Root sit down with us at our table."

Of course, after this I felt perfectly free to get acquainted, not only with the children, but with the pack of hounds and the puppies. Friend Craven is a genius, and his special hobby is hunting, trapping, and studying the habits of wild animals. In Wisconsin a large bounty is offered for the scalps of wolves, bears, etc., on account of the damage they do to sheep and other farm stock. Mr. Craven informed me that the wolves some years ago destroyed fifty dollars' worth of sheep in one night on that very farm. The bounty paid for wolf-scalps is something like this: Ten dollars for a

C. has the dogs so well trained that he forbade any one of them biting the wolf at all, and he went in and caught him and put a collar around his neck. When we went in to see the wolf, he turned his head one way and then another, and even pushed it down in one corner, out of sight, covering it with his paws. He seemed to say by his actions, "I do not want to see you at all. Please go off and let me alone." And then he fairly whined, because he felt so bashful, and so much embarrassed in the presence of strangers. His master, however, pulled him out of the corner by a chain, and made him stand up and show himself. I told friend C. that, if he would get the wolf out into the sunlight, I would take his picture with the Kodak. For a long while he kept putting his head down between his paws, or down against the woodpile. But finally we got him to look up; and while he was glaring at me, and showing his teeth, I snapped the key of the Kodak, and here is his picture.

I just wish you could have seen the glare of his eyes as he showed his teeth at me, as he thought I was going to shoot him, or possibly scare the life out of him in some way or other.

Just as we were ready to start I was greatly interested in seeing the thirteen hounds jumping and capering around Mrs. Craven, who was just going out into the yard with a small-sized tub, or something of the sort, in one hand. It was time to give them their dinner, and I laughingly remarked that they were interested in their daily food about as much as any of us. Mr. Craven, however, replied:

"Friend Root, it would perhaps surprise you if I should be able to draw their attention to something else so effectually that, hungry as they are, their dinner would be forgotten and deserted in an instant."

I replied that I could hardly see how it were possible; but he bade me please watch him carefully. I saw smiles on the faces of the rest of the family. Well, what he did

was to slip into the house very quietly, and presently return with his gun. He kept the gun out of sight as much as possible, screening it by his body. But pretty soon one of the grayhounds caught a glimpse of it. In an instant it uttered a peculiar call, or bay; and as if by magic every one of the beautiful animals left the food and started after their master. He slowly walked toward the gate, still keeping the rifle out of their sight; but their eyes and instincts were keen. The whole pack set up a chorus of voices, and in their joy they leaped and bounded around him as if they would spring over his head. Some of them bounded on as if to lead the way; and you never before, perhaps, witnessed such rejoicing by a lot of dumb animals. All this was just because they supposed he was going out for a hunt. Perhaps miles upon miles of travel lay before them, so far as they knew, and doubtless hours of time

THE WOLF THAT DIDN'T WANT TO HAVE HIS
"PICTURE TOOK."

young wolf, and fifteen for a she-wolf. You see, they pay extra for destroying the *mother* of a lot of cubs. I want to say right here, that friend France is also a celebrated wolf-hunter. In one room of his building at home he and his boys have fitted up about as interesting a museum of stuffed wild animals as we see at our colleges.

After dinner we went into the front room, and one of the curiosities on the table was the skull of a bear, with a hole broken in at one part of it. By the side of the skull lay a hatchet, and friend Craven told me he killed that bear in a hand-to-hand encounter, with no weapon but the hatchet. Friend C. has a pack of thirteen hounds, to assist him in hunting wolves and bears. In a pen near by they had eight puppies just old enough to be pretty and cunning. Inside of the little building, or barn, was a young wolf which the dogs had chased into a brush-heap, if I remember correctly. But friend

without food; but for all that their dinner was abandoned without hesitation, and, to the greater part of them, untasted. Can you wonder that my heart bounded with the enthusiasm which I caught from them? and I fairly longed to go with the dogs and their master, off on a hunt. As I mentally go over the scene I can not help but wish now that I had stayed, even if it made me a week longer in getting home. Next time I will tell you about a wolf-hunt.

A BLACK BEE.

Here is a black bee, and it has long white hair on two of its legs. I never saw any like it before. We have 19 swarms of bees. I help hive the bees when they swarm. Mr. Root, what kind of a black bee is this?

CUSTER R. BROWN, age 12.

Colora, Md., Aug. 23, 1889.

The bee you inclose we should say was nothing but an old black bee. He has been in the service a good while, and has worn the fuzz all off his body, which makes him look real black and shiny.

HEAVY RAINS.

We have two new swarms of bees, and we had another one; but it went back into the hive. The last one stung papa eight times, because they were so cross. We had a heavy rain here in July, and the wind blew branches off from trees, and it blew the wild cucumbers off from the windows. We have not had any surplus honey yet. Our main crop comes from heart's-ease. The Japanese buckwheat that papa got of you is in bloom.

EVERETT THIERY, age 9.

Waco, Neb., Aug. 16, 1889.

UNCLE'S BEES.

My papa has no bees, but I was down to Mr. Stuck's, and he has 45 stands. I watched them a little while. They are making lots of honey just now. Uncle Joseph was hunting bees, and found 4 swarms; 2 were in large trees, and the men didn't want them cut. He cut 2, and brought them home, and each tree had about 25 pounds of honey. Mr. Stuck told me he took off 300 pounds of honey this summer, and has a lot more ready to take off. We live in the country. I go to Sunday-school. I love to go. We have Sunday-school after church. I wish all little boys and girls would go to Sunday-school.

MAGGIE KREBS, age 11.

Schoolcraft, Mich., Aug. 19, 1889.

PAPA'S BEES.

We live up here in Minnesota where there are a great many who keep bees. Six years ago my papa got two colonies, and he has now 115. Last winter he got Mr. B. Taylor to make him 56 hives. Pa thinks they are just the thing to have. He has a place fixed off in the cellar that he winters his bees in. Papa takes GLEANINGS, and he said that he couldn't get along without it. And he also has the A B C book. Papa never did feed any of his bees, as other people do that keep bees. Papa had 4 or 5 swarms go off this summer. Do you think a swarm of bees would go off without clustering first? Some people that keep bees up here say that they had a swarm of bees come out and go right off.

EMMA LEVEY, age 10.

Preston, Minn., Aug. 27, 1889.

Swarms do not generally go right off without first alighting, though they have been known to do so.

THE EVILS OF THE TOBACCO HABIT.

BY THE AUTHOR OF THE TOBACCO MANUAL.

DEAR BROTHER:—I usually read your Tobacco Column in GLEANINGS. In the issue of Aug. 15th, I think there is no such column. In seeing that it was wanting in one instance, I thought that I would write you a sketch of what I am doing this summer; and if you can find nothing better to put in your columns you are at liberty to use this. I thought that I could not use a little of the latter part of the evening of life better than to give a few lectures on the tobacco habit. In cold weather I am not able to be out much, on account of a bronchial affection with which I have been afflicted for some years. I began in May, after it became so warm that I would not be exposed, and shall continue till cold weather. I met with far less opposition than I expected in this work. One fact I try to emphasize in all my lectures, is the ease by which a person may fall into, or contract, a habit, that it is so hard to get rid of. Few are the boys that would wish to contract a habit that would be galling to them the rest of their lives. And yet this is just what most of them are doing when they are smoking their first cigar. One man said to me, just the other day, "I would give a hundred dollars if I could quit the use of tobacco, and be myself, without it." Another who had quit said to his friend who wanted he should take another smoke with him, "I would not do it for a hundred dollars. I would not have the fight over again." Still a third, who had four sons that he wanted to keep from using tobacco, stopped himself to be an example to them; and on being importuned to use it again he said, "Not for a thousand dollars." That was his estimate of his example to his sons. And yet a fourth, who had learned to use tobacco—and yet a young man, but little more than twenty, had the habit so firmly fixed that he said, when importuned to stop, "I would not promise to do it for a thousand dollars." It appears a matter of but small moment to smoke now and then a cigar or take a quid of tobacco; but when one has been beguiled into the habit, the quitting is not so trifling a matter. I found an old man the other day who had not used tobacco for two months, and that day he was chewing hops vigorously, and the women in the neighborhood were sympathizing with him in his effort, if possible, to break up the habit of using tobacco. I don't know how it will turn out; but a woman told me but yesterday that her husband, on quitting the use of tobacco, chewed poplar twigs for a whole year, carrying them all the time in his pocket. So hard is it often to break up the habit that is so thoughtlessly acquired. A sure way to stop the tobacco habit is, *never begin*.

I find many wives, wherever I go, who tell me that, if their husbands are out of tobacco, they would go and get it for them, if they had to pay for it by taking in washing; because they are so irritable and cross, if, perchance, they are without. One of my gravest charges that I bring against tobacco is that it is capable of bringing a person into such a condition, in body and mind, that he can not be pleasant and agreeable without that draught of poison. There is not that family of children, whose father ordinarily uses tobacco but knows, *too well*, when he is without it.

The great evil that tobacco is doing in the com-

munity is not generally sufficiently understood, except by physicians, nor by all of them. For instance, last Sunday I dined with a man in a small town of a few hundreds, and he told me that he had so used himself up with tobacco that he could not write with a pen, and with a pencil only as he steadied one hand with the other, barely to write his name. By the advice of physicians, and with a very great trial, he succeeded in giving it up; and now he can write with a pen, and is enjoying quite good health. He also told me of another man, quite young, in that town, who had to give up business; he called him demented; said he was able to walk about town some, and that doctors were trying to keep tobacco from him. They hope to see this young man recover, and he probably will, if they can keep tobacco from him.

The effects of tobacco are functional, at least for a time; and if the habit can be broken, and not returned to, we can be hopeful of a permanent cure. I have met with two physicians in my lecture-tour who have told me that, during the past year, they have met with patients who did not know what was ailing them, and all they had to do was to prescribe the non-use of tobacco. In both instances, they said, the prescription was followed rigidly, and proved efficacious. There have been, in former years, two difficulties in the way of such prescriptions as I have just mentioned. Some patients have not been willing to believe that the doctor has rightly diagnosed his disease, and perhaps still more who have been unwilling to follow the prescription. However, we will hope, as more light is being shed on the subject, that physicians and patients will get along better in the future than they have in the past.

In my lectures (giving but one lecture in a place, of course), I can say only very little of what might be said on the subject. After a brief introduction I give the poisonous properties of tobacco, as shown by analysis, and then lay down a few well-known propositions, such as are easily proved by undoubted testimony. They are substantially as follows: Tobacco interferes with physical development; it hinders intellectual attainments; it lowers moral character; it is disease-producing; and I close by showing the influence of tobacco on the present condition and future prospects of the church. Under the last head I attempt to show the vast amount of waste of time and money, a portion at least of which rightly belongs to God. The notorious fact that there are twice as many names of females as males on our church rolls, when taken in connection with the fact that at least nineteen-twentieths of all the tobacco used in our land is by the males, is significant in the discussion of the last proposition. Do away with the production and sale of liquor as a beverage, and tobacco, and I believe we should see our boys and young men as willing to take the vows of the Lord upon them as are our girls and young women. I am quite tired of hearing it argued, as is done in some quarters, that our all-wise Creator "has formed the female mind, by nature, more trustful than he has the mind of man." I would rather trust the mercy of God now than to bring the charge against him, at the judgment, that he did not form my mind as "trustful" as he did the mind of my wife, or the mind of my son as "trustful" as he did the mind of my daughter. I would not restrain the grace of God; but I must confess that I have but small hope

of seeing the boy, or young man, converted, if he keeps himself narcotized with tobacco.

Mapleton, Minn., Aug. 19, 1889. N. A. HUNT.

Your array of facts prompts me to give something from actual experience here in our own town of Medina. One of our prominent physicians, perhaps the most prominent, was a few months ago very sick. In fact, it was currently reported that he must die, and I never expected to see him out on the street again. In a few weeks, however, I was surprised to meet him. Some little time afterward I asked him what it was that brought him up so quickly—whether it was some important remedy or the skill of some city physician. In short, I told him that I should very much like to know what doctors did when they were dangerously ill. He laughingly replied that he guessed it was a duty of his to tell me all about it. He finally said that, so far as he could determine, his recovery came solely and simply from leaving off a bad habit.

"Why, doctor, you don't mean to say that you were addicted to bad habits while on a sick-bed, and near death?"

"Yes, Mr. Root, I do mean to say just that. And when I decided it was tobacco that was killing me, I cut off right sharp, and got well at once."

But he did not stop his story there. Some little time before the above events, a prominent druggist in our town had a strange affection that made him fear he was losing his mind. He kept getting worse, and he was finally unable to attend to business. He just stayed at home and brooded over the dark cloud that hung over him. He had not even the solace of sleep, for, to tell the truth, he could not even sleep nights. Now, this druggist has a father-in-law who is an old and skillful physician. Of course, the father-in-law did all he could for the patient, but all to no avail. He had already given up business, so as to have his mind free from care or anxiety, but "was nothing better, but rather grew worse," as we read in the language of Scripture. Finally, at the very urgent solicitation of his friends, he called in the physician who had recently recovered. The symptoms were but too well known to him, and he pronounced the whole trouble the result of using tobacco—nothing else. Now, this man rather thought he had not used more than three or four cigars in a day, or possibly half a dozen. The cigars were stopped, when, presto! nature proceeded to build up; reason settled down squarely on her throne, and our friend was able to take care of his business, and to enjoy life. Well, I should like to add that he, like the doctor, cut right square off. Truth, however, compels me to add that the old tyrant did not let him go quite so easily. The last I knew of the case was when I overheard him telling a friend that he could not accept his invitation to smoke, for his physician had cut him down to *only three cigars a day*—one after each meal.

Our proof-reader just now points me to an item in the *Pacific Rural Press*, for June 15. Here it is:

Dr. Hammond has a wise remark on cigarette-smoking—that laws to prevent children from smok-

ing them are impossible of enforcement; that this can be done *only by educating parents* to let tobacco alone. Nearly all the States have indulged in legislation against children. Minors must not do what they see their fathers do. The manufacture of cigarettes may be forbidden, and probably ought to be stopped, as they are, almost without exception, drugged. Dr. Hammond considers the use of tobacco a greater evil than the use of alcohol, and he has the argument with the facts.

OUR HOMES.

Thy word is a lamp unto my feet, and a light unto my path.—PSALM 119: 105.

I FOUND friend Freeborn not only a bee-keeper, but a nurseryman and fruit-grower; and, best of all, a humble follower of Christ Jesus. During my brief stay we did not have time to talk on the many subjects that were of great interest to both of us. But just before I left I found him to be a brother indeed, in more senses than one. Years ago, when the Home Papers were first started, they struck home away out in Richland Co., Wis., in a way that I should never have dreamed of, had it not been for my visit. Brother F. told me of some of his experiences, and how he had learned, in the language of our text, to say, "Thy word is a lamp unto my feet, and a light unto my path." As I look back over the years that are past since I first commenced pleading for Christ Jesus, especially since during my travels I have found a brother here and there whose heart was reached, and, may be, through my earnestness, led to that "Rock that is higher than I," I can only say, "May the Lord be praised for what he has been pleased to do with my humble efforts!" It seems strange and wonderful that I should, without having any knowledge or conception whatever of what was needed in a certain home, have sent just the message that was perhaps required to start some poor soul on the upward grade, from darkness into light.

Friend Freeborn kindly took me in his buggy off over the hills (that are really miniature mountains), to the beautiful place of his son-in-law, Mr. C. A. Hatch. Mr. H. is one of the wide-awake, progressive young horticulturists of the State of Wisconsin. I greatly enjoyed a ramble around friend Hatch's place, especially through the nursery and among the blackberries, raspberries, currants, etc. Friend Hatch has a silo, and is working in a line with all modern improvements. If I am correct, he is president of the Wisconsin Bee-keepers' Association. In a line with the bear stories that I got hold of while in California, friend H. said they had one to tell. Not very long ago, a bear, after killing several sheep and calves, came into Mr. Hatch's apiary, turned a hive over, scooped out all of the honey he wanted, then came up to the window of the honey-house, which was simply covered with wire cloth. He peeked through the wire cloth, to see what there was interesting inside, gave it a few digs with his claws, and then went on. He evidently was not particularly interested in honey-extractors, one-piece sections, and other apiarian appliances.

The bear was followed up, and killed shortly afterward.

There was a good deal of scolding when I told them that I must take the train for Green Bay in the morning. Friend Freeborn said that ever so many had been making great calculations on seeing me, and one of their ministers had planned to have me talk to some of his people, who would not listen very much to a *preacher*. I felt a great deal touched at this exhibition of his faith in my poor efforts; but it made me sad to think how disappointed this good friend of mine would be if he knew A. I. Root as well as some of his intimate friends know him. Toward evening friend Freeborn and I had a grand ramble, sampling the new varieties of berries away up on the steep hillside. Why, I should never think of using a horse there to cultivate, any more than any thing in the world, where the ground is so sloping that one fears every minute he will tip over and roll clear to the bottom of the hill. But I tell you, the *berries* grow on these hillsides. Next morning, before train time, we visited his apiary at Twin Bluffs, and saw the boys commence extracting again from the very same hives that had been emptied completely only about three days before. The station agent there was also a bee-keeper, and of course he had a friendly greeting for your humble servant. Twin Bluffs derives its name from two beautiful round-topped hills that look almost alike.

My visit to Green Bay I have already described. When that was finished I made all haste to get a steamer at Milwaukee, that I might be enabled to pass the Sabbath with my sister in Manistee, where I expected to join Blue Eyes. But, alas! with all my haste I was obliged to stay in Milwaukee over Sunday. The steamers leave every night in the week except Saturday. I tried to find out some bee-keeper or honey-dealer before night set in, but I did not succeed; and finally, tired out with the labors of the week, hungry for supper, and somewhat homesick, it must be confessed, I sought the nearest respectable hotel. Now, I did not intend to stop at the *finest* hotel in the great city of Milwaukee; but by some sort of blundering I got there nevertheless.

I am rather glad I did, however, for the Plankinton House afforded me a grand opportunity of studying humanity among the higher circles. When told their prices per day were from \$2.50 to \$5 00, I asked for the \$2.50 accommodations. Even at this price my room was a beautiful one—a good deal finer and nicer than I deserved, as it seemed to me. I made up my mind at once that I was going to see what there was particularly different in this great fine hotel from ordinary ones. Well, now, I was greatly pleased and gratified to find that, if it were not a Christian spirit that pervaded this fine house, it was something very near like it. For instance, when I first asked the clerk some questions, he very pleasantly, and without a bit of the superior air that we sometimes find, directed me to a desk adjoining his own. Here I found a good-looking man standing ready to answer all the questions that anybody might need to ask.

Not only this, he had the city directory right before him, and seemed to have learned it so as to have it at his fingers' ends. He at once spoke as kindly, and with as much interest as if he were your S. S. teacher. Besides, errand-boys were ready to do his bidding. He told me all about the churches, Sunday-schools, Young Men's Christian Association, Women's Christian Temperance Union, etc. When I asked him about A. V. Bishop he told me that Mr. B. was but a few doors away, and that a boy would go with me and see if he was in his place of business. When we found he was not, I was directed to Mr. Bishop's residence. Well, he had moved away. But our friend who is employed by this rich institution to help people—in fact, to “minister” to their wants—did not propose to give up, by any means. He found out where Mr. Bishop had moved to; but by the time we got there, no one seemed to be at home, and so we gave it up. Of course my good friend would have assisted me to make Mr. B. a call on Sunday, had I been so inclined. Of course, I did not wish to do so. However, I apologized for making so much trouble, and asked to be shown the building of the Y. M. C. A. I was assured, with a smiling face, that such was their business, and that they were always glad to assist the guests in any thing they wanted. Now, I tell you, friends, there is a moral in all this. This great firm had, without doubt, taken pains to pick out a man whose patience was almost inexhaustible, who could answer questions from morning till night, look over directories, listen to any long stories that any of the guests of the house might tell in explaining his wants, and then go to work and *help him*, in the strict sense of the word. This clerk was not an exception. The waiters all over the establishment seemed to be picked men. A bright colored boy takes your hat when you go in to meals, and when you go out he gives the right hat to the right man every time, and does it with a smiling face. When you remember that there are a hundred or more hats and a hundred or more men, you can see that our young friend must be something of a genius. He takes a good look at the hat and then a good look at the man, and I never saw him make a mistake. Perhaps these good friends were all Christians? They certainly acted Christianlike; but I am afraid it was more because they were *paid* for exhibiting Christianlike virtues than because they loved God and humanity. Sunday morning I was up between five and six as usual. My good friend had told me, the night before, that there was no place of worship open before half-past nine. At this hour there was a Methodist prayer-meeting in one part of the city; and wishing to attend as many religious services as possible, I proposed to be on hand; therefore when I had got my breakfast (there was no trouble at all in getting breakfast at six o'clock in the Plankinton Hotel) I looked around for a Bible in order to study my Sunday-school lesson. Well, our obliging clerk, who knew the directory from beginning to end, and who could have furnished

me any thing to *eat* or *drink* that can be found in almost any part of the world, was stumped when I asked him for a Bible.

“Why, my friend, there are probably Bibles in the house somewhere, but I do not know just where to put my hand on them at this hour. I have one at home that my mother gave me, that would be most cheerfully at your service if I could get it just now. But as it is, I do not know what better we can do than to wait until the Y. M. C. A. is open at half-past ten.”

When I was at Woodman, the storekeeper that was offended at my plain talk, said that, if nobody patronized the saloons, there would not be any. He rather threw it in my teeth. This good friend here said it very kindly, but he rather intimated that few people ever called for Bibles at half-past six on Sunday morning; but that if they did, the proprietors of the hotel would certainly have had them in abundance. In fact, they make it one of the *fine* arts to minister to the *wants* of the great sea of humanity that is found in our large cities. I was a sort of eccentric or peculiar individual, or I should not have wanted a Bible—I was going to conclude this sentence by saying, “at such an unseasonable hour;” but my good friend to whom I am dictating was going to put in, when my attention was called to other matters for a moment, “before most men wanted their every-day garments.” Now, I would have cheerfully given the price of a good Bible for the use of one for just those two or three hours. My friend at the desk suggested that I could probably get one at the bookstores; but I told him that the bookstores that were open on Sunday would not, on general principles, *have* Bibles to sell. I did not go out on the streets and try it, for you may remember that it is not very many months ago that a good friend gave me quite a smart reprimand for patronizing people who do sell things on Sunday. While doing every thing I could think of to keep the Sabbath holy, without a Bible, my thoughts ran in the line of our text to-day. May the Lord be praised that I *have* found the word of God “a lamp unto my feet and a light unto my path”! If I could not have a Bible, I concluded I would go real early to the Methodist prayer-meeting, and so I started off a good deal before the time. My good friend the clerk told me how many blocks it was away, but I did not think very much about “blocks.” When I neared the great Trinity Methodist church I felt glad to know that such large numbers of people were, like myself, going to the prayer-meeting. From their talk, however, I judged they were not just the kind of prayer-meeting people that I had been in the habit of meeting.

When I *first* came into Milwaukee I noticed some great showbills telling by pictures, as well as by great big letters that some girls were going to play a game of base ball. I now noticed that this game of base ball was to come off on Sunday. The girls who were to play were to be rigged out like ballet-dancers; and as we neared Trinity church, the number of pictures in regard to this game of base ball became

more frequent than ever. When we came to the church, the streets were literally filled with crowds; and then I discovered that the game was in a park a little beyond the church. I had been, for a mile or more back, in with the crowd of Sabbath-breakers, going to see girls play base ball on God's holy day. With a sad heart I reached the church. Its doors were not open, and I sat down on the steps. Nine o'clock came; quarter-past; then half-past. Not even the sexton came to open the doors of the magnificent structure that the worshipers might go in. The crowd still surged past to the ball-grounds, and finally *two women*, but no men, came to prayer-meeting. I could not help thinking then of the time when all the world had given up and lost faith in Christ Jesus, our Lord and Savior, and only a couple of women came in the early morning to perform the last rites to his dead body. It just then occurred to me that I was then so far away from the Congregational church, where I proposed to attend preaching, that I could not get back in time, even by the aid of the street-cars. But by inquiry I found there was a small Congregational church not far away from the Trinity Methodist church. I reached there in good time, only to be told that, for some unaccountable reason, the minister had failed to come. Where was the sexton? and where was the leader of that Methodist prayer-meeting at half-past nine? Where, too, was our Congregational minister at half-past ten? Now, don't be hard on me, dear friends, if I did wonder just a little whether it was not possible that these brothers had caught the infection, and gone with the rest of the multitude to see *girls* play base ball. By the way, is it customary to have base ball on Sunday? How is it where you live? May God forbid that this custom should ever get to be common; and a thousand times more may God forbid that the other sex should take up the game on that holy day—the sex that we have been taught from childhood up to regard as a model of every thing that is pure and holy. May be I am finding a good deal of fault with the city of Milwaukee; but I do feel that it was a burning shame that the good people of that city should allow at least a great portion of it to be hung with posters as it was on that pleasant Sabbath morning—posters that were *conspicuous* because of the display and *prominence* that was made of the bare legs of the women or girls who were going to play base ball.

I am now going to tell you what I found in Milwaukee that was *good*. The Sabbath-school in the little church I have mentioned was well attended, and a true Christian spirit seemed to pervade every heart. My heart went out in love to the dear brother who conducted the Bible class, wherein I found a place. His voice betrayed a slight foreign accent; but his words, that came from the very depths of his heart, showed unmistakably that he was intimately acquainted with the dear Savior. The Y. M. C. A. building is one of the finest edifices I was ever in. I think I have been told that it cost something like a *quarter of a million*

of dollars, and that there is perhaps no other Y. M. C. A. structure like it in the United States. The address to the young men was most grand, and fully up to the times. The city is one of the neatest, cleanest, and prettiest that I have ever visited. The rooms of the W. C. T. U. were in plain sight, right across the street from the Plankinton Hotel, and I intended to call there; in fact, I did think of applying there for a Bible; but I was a little timid about going out, even on such an errand, so early on Sunday morning. I suppose that Milwaukee is as well supplied with Bibles as perhaps any other city, and perhaps there were thousands that very morning who would gladly have extended to me the family Bible, had my wants been known. The absence of worshipers at the places of worship may perhaps be explained by the fact that my visit was about the season when many ministers take their vacation. But I tell you, dear friends, it seems as if we ought to bear in mind the fact that Satan *never* takes a vacation; and I should not be at all surprised if he plans his work and masses his forces so as to make his very biggest hits just about vacation time of the church and Sunday-school. The thought of the little ones being led by their parents toward that base-ball game on Sunday morning still haunts me—those little ones rigged out in their Sunday best, and in tiptop trim for Sunday-school—little ones ready to be led to Sunday-school, or ready to be led into the very clutches of the evil one. Dear brother and sister, how is it with you? and how are you leading *your* children? Do they know, and have they already learned, that God's word is a lamp unto *your* feet and a light unto *your* path?

OUR OWN APIARY.

CONDUCTED BY ERNEST R. ROOT.

RAISING CELLS A LA DOOLITTLE.

DURING the last few weeks we have been raising, or, rather, completing cells, in the upper stories, above perforated zinc, of two or three strong colonies. The plan is a success after cells have been given them already started. Although we anticipate doing so soon, we have not yet made the little cells with the rake tooth, described in Doolittle's book, and giving the same, when filled with larvæ, to the Doolittle upper stories, as we call them. So far we have been selecting here and there cells started, and which have already in them the larva and its royal food. These have been stuck on to the combs in the Doolittle upper stories. In process of time they were built out nicely, and completed. At first our Mr. Spafford thought they were larger than cells built in queenless colonies; but now he thinks he sees no difference. Those cells that I examined were very nice, but I did not think them any larger than cells built in queenless colonies. But more anon on this subject.

THE DOOLITTLE QUEEN-CELL PROTECTORS.

Some years ago we illustrated and de-

scribed the Doolittle device as above. Later, having tested them, we gave a report as to their workings. This report was rather unfavorable. During the latter part of this summer we have been using them again; and where colonies seem determined to tear down cells, they are no doubt a good thing. Our Mr. Spafford says he does not know how we could get along without them, in some cases. When we first tried them, they seemed to be more the *cause* of cells being torn down than an actual protection; but we now know that we did not insert the cells properly. Some of the readers may have forgotten just what these protectors are, and I here reproduce an engraving which we gave a couple of years ago.

THE DOOLITTLE QUEEN-CELL PROTECTOR.

To put in the cell, insert it so that the apex will close the mouth of the protector. It should also retreat a little from the outside edge. Twist the strands of the four corners together, and push it down between the brood-combs. When bees tear down cells they usually make a hole in the side, and rarely attack the end of the cell where the queen gnaws out. As the bees can not get at the sides of the cells, the queen is allowed to hatch when she pleases. One very pleasant thing about these cages is the fact that a cell in one of them is protected from the careless handling of the apiarist. It can be crowded down between the combs, and when the hive is opened again after the lapse of a couple of days, to see if the cell is hatched, the frames can be pulled apart without danger of tearing open the cell. The protector can be lifted out; if the cell is not yet hatched, it can be reinserted between the combs.

A QUEEN - EXCLUDING HONEY - BOARD AS AN ANTI-SWARMER, OR QUEEN-TRAP.

On page 637 of the issue for Aug. 1, in my answer in the Question-Box department, I incidentally mentioned the fact that we had been using a queen - excluding honey-board between the brood-nest and the bottom-board, for the purpose of preventing the queen from going forth with the swarm. Although the idea was original with me, I did not at the time so state it, because I felt quite sure that some one else had antedated me in something so obviously simple and suggestive, in the style of a hive such as the Dovetailed. By an article which we publish on page 669 you will see that Mr. James Heddon tried the same thing in 1884, or earlier. Since that time Mr. John H. Howard, of Holme, near Peterboro, England, a supply-dealer, and a well-known writer for the *British Bee Journal*, writes that we have been using the honey-board in the combination above named, without giving him credit, and says that he used the same thing in

1886, and has since been granted a patent on it in Great Britain, and intimates that he may patent it in the United States. If friend Howard will turn to page 669 he will see that Mr. Heddon has antedated him by two years, which entirely sets aside his getting a patent on the same in the United States; and, if I am not mistaken, it would render the one in Great Britain useless so far as giving him the exclusive use of it is concerned. Now, I should not be at all surprised if some one had used the same idea earlier than 1884. I do not bring this thing up here to provoke controversy, but simply to show that, when we think we are original in a thing, we are pretty apt to be mistaken in these days of progressive bee culture. Please read our comment in reply to A. A. Fradenburg's article, in another column, in regard to priority and early use of raising queen-cells in the upper story of a colony already possessing a queen.

BEES WORKING ON JAPANESE BUCKWHEAT; PHOSPHATE.

For some reason or other, reports have seemed to indicate that the bees pay more attention to other varieties of buckwheat than to Japanese. One of our lady beekeepers, a Mrs. Shane, of Chatham, Ohio, had four acres of Japanese in bloom. Her apiarist told me that the bees fairly swarmed on it during the morning, and sometimes even during the afternoon. By an accident, a part of it was phosphated and a part not. The former was in every way superior to the other. Neighbor H. had some 20 acres near our basswood apiary. He said the bees were working upon it very heavily. He phosphated a part of it, and the rest was put in without phosphate. Bees were working altogether the best on the phosphated. I went down a couple of mornings to see the bees at work; but before I got around to go down, the weather became so dry that but very few bees were upon either patch, although the piece with the phosphate showed some few bees. The stalks on this piece of buckwheat, I should say, were on the average twice as high as the stalks on the other piece without phosphate.

ANOTHER RED-CLOVER QUEEN.

In our home apiary we have a genuine red-clover queen. She is, I think, fully equal to the one which we had several years ago, that showed such remarkable qualities. While the other colonies in the home apiary have been doing little or nothing lately in storing surplus, the bees of this red-clover queen have been storing honey from red clover in the sections right along. There has not been a day, I think, but that they have been busy. Day before yesterday we took off 50 lbs. of section honey, a large portion of which was from red clover. Desiring to raise some queen cells, we took out two of the brood-combs and inserted a couple of empty ones in their place. Before the queen could deposit an egg in either of them, her bees crammed them full of honey, and this during a time when drouth has been prevailing for almost a month back. The worst part of it is, the queen is already two years old. We shall do all in our power

to preserve her as long as possible, and in the mean time will give her an ample opportunity to raise drones, so that the latter will infuse their blood into some of our own home-bred queens. We shall also commence rearing queens from her. Although not an imported queen, she is a daughter of one. She is not very light-colored and her workers are not extra yellow, although having the three characteristic yellow bands.

OUR MINORCANS.

A couple of months ago, Mr. F. C. Andreu, of Port Mahon, Spain, editor of *Revista Apicola*, sent us a Minorcan queen. The bees have hatched out, and some of them are now a month old, so that we have an opportunity of judging somewhat of their disposition. They are nervous, and rather more vindictive than Italians. The queen is exceedingly prolific. The Minorcan bees themselves are black, and look very much like the common blacks of this country. They might also be easily taken for Carniolans, both in color and in general disposition, although I think the Carniolans are not quite so nervous. I will report further in regard to them later.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

MAKING GARDEN IN SEPTEMBER.

JUST as soon as it begins to be cool weather, I begin to feel an unusual interest in all sorts of gardening that can be done in the fall. Some way or other—I can not exactly tell why—the mellow soil has a wonderful fascination for me just before frost comes, or perhaps a little after frost. At this season of the year, ground that has been tilled is usually in fine nice order; and it has always seemed to me too bad to let it lie idle. Then the question comes up, What is there that we can plant and nurse and care for in the months of September, October, and November? What is there to look fresh and green and thrifty, that frost won't harm? Well, so far as planting seeds is concerned—that is, planting to do any good—our list is a rather small one. Just as soon as any crop is finished and done for, I want to see the ground cleared off, and have something take its place. What can we plant, as one crop after another disappears. At first I was going to say there are only two things that will stand the severest weather here in Ohio. These two are rye and spinach. Spinach, with us, stands just about as severe freezing as does rye. The first is a profitable crop to raise, and can be sold in the winter at any time when there is a thaw; therefore I would have plantings of spinach every week or ten days. Just now is perhaps a good time to start spinach to be wintered over. Rye is sown only to be turned under in the spring, for no one presumes a market-gardener is going to make it pay to raise rye. Well, there is another thing. The winter onions may be planted this month or next, and they will come right up

and grow, and seem to do all the better when the weather gets colder.

Oh, yes! there is still another thing that you can plant, and plant largely, during this month and next, and you can manure the ground and fertilize it, and work it up fine to your heart's content, and with a pretty good prospect of making it pay too. Shall I tell you what it is? Why, *strawberries*. They will grow and send out runners for two months yet, and the frost just makes them handsomer, until it gets to be *severely* cold; and even then, if there is a tolerable covering of snow, they do not seem to be hurt any. Strawberries are my special favorites in these fall months. You have plenty of time to pick off the runners as fast as they appear, and loosen the dirt around the plants, and give them liquid manure. I know some writers say you should not encourage a rank, strong growth late in the fall; but I have never seen a bit of bad effect from it. The plants that I fairly covered up with little chunks of manure, so that when a shower came, the water all around them looked like green ink, gave the biggest crop the next season, of the biggest berries. I do not believe you can hurt a strawberry by excessive stimulating, no matter when you do it. In getting plants for sale, our boys have been in the habit of laying a little lump of dirt or a stone on the runner, to keep it where they wanted it, I saw them at it, and said, "Why, bless your hearts, boys, don't use stones or lumps of dirt. Just get a wheelbarrow full of chunks of rich manure, and lay a lump of manure over each runner, close to the embryo plant."

GARDENING UNDER GLASS

The one who learns to love to see plants grow, will, as frost approaches and increases, very soon begin to feel a longing for some sort of protection. Cucumbers, tomatoes, and ever so many other things, run up in price very quickly when frost appears. Something to keep the frost away will often prove a good investment. Cloth frames answer very well until snow comes. When you begin to get snow on top of your cloth, it is a nuisance. Then you must have wooden shutters, or, better still, glass. Just now thousands are turning their attention to cold-frames, or cold-frame greenhouses to be warmed in different ways. A cold-frame greenhouse is one so made that one can go inside of it. Now a word in regard to setting glass. For the past year we have been using the Ives putty-machine, advertised in our floral and gardening periodicals. With this the putty is diluted with good white paint until it can be forced out in a liquid form, where the glass touches the sash. Dry sand is then blown on the sticky paint as long as the paint will hold it. When dry it is as hard as stone. Now, the Ives putty-machine costs \$1.50; but we decided it was well worth four times the price, because of the saving of labor in setting the glass. One of our boys happened to be in the counter store, and picked off from the 15-cent counter what is called the Atlas insect-powder gun. This is made for blowing pyrethrum or any other powder on the insects. It is

simply an oval rubber ball, with a nozzle attached to one end. By cutting off the strainer from the large end of the nozzle, we had a putty machine all ready for use. Mix your paint and putty just right, fill the rubber ball, then by squeezing the ball you can send a stream of the liquid paint exactly where you want it. Two of our men decided at once they could work faster with the 15-cent machine than they could with the \$1.50 machine. This insect-powder gun can be sent by mail at an expense of only 4 cents for postage.

SAVING TOMATOES FOR SEED.

In answer to several questions, you may save the seed from any tomato that pleases you; and even if you have a dozen varieties in the same row, there is no danger of mixing—at least I have been told so by the experiment-station folks. The present indications are that the *Ignotum* tomato-seed will command a big price next season—perhaps \$1.00 or \$1.50 an ounce; therefore you had better save every seed. To save the seeds, just scoop them out of the tomatoes before you cook or can them; set them in a bowl or dish, with a little water, in some warm place, until the whole mass gets sour. When it is sour enough to begin to smell bad, the seeds will wash out as clean and handsome as you please. Spread them on plates or boards to dry, and that is all there is to it.

COLD-FRAME CABBAGE-PLANTS.

If you are going to have some sash, or even wooden shutters, to cover your cold-frames, this is the month to sow your Jersey Wakefield cabbage-plants. It is often said, that just as good plants can be obtained by sowing them in the greenhouse in February; but my opinion is, that, even if we can, we do not often succeed in getting them. Plants properly wintered in cold-frames may be planted out just as soon as the ground can be worked, even in the latter part of March; and as they have already been frozen up hundreds of times, freezing does not hurt them a bit; and your first cabbages will, as a rule, be from the cold-frame plants. Start them about the middle of September, and get nice plants, just as you would do in spring. In order to get a good stand—that is, just as many and no more than can occupy your cold-frame, you *must* transplant them. They also want to be in the ground clear up to the first leaves, and you can not secure this without transplanting.

THE KUMERLE LIMA BEAN.

The Henderson lima bean is now ready for the table, and some of the pods are ripe and dry. It is all right, except being so small. Its size, in my opinion, is going to rule it out. We are glad to report, however, that the Kumerle has proved to be very prolific, and many of the beans are ready to shell. The probability is, that most of them will escape frost. The Kumerle is a real *honest* bush lima bean: the Henderson is not, for the reasons above given.

400 BUSHELS OF POTATOES TO THE ACRE.

I have this season succeeded in getting over 100 bushels of potatoes from a quarter of an acre. They were Lee's Favorite. At

an expense of 3 cts. per bushel they were dug, picked up, and stored. In my next I will tell you how I did it.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, SEPT. 15, 1899.

Thy testimonies have I taken as a heritage for ever: for they are the rejoicing of my heart. —PSALM 119: 111.

FRENCH, GERMAN, ENGLISH, AND AMERICAN BEE-KEEPERS.

OUR proof-reader, in glancing over foreign exchanges for August, found the following in the *Schweizer Bienenfreund*, from the pen of Mr. T. Kellen, of Luxemburg. Mr. Kellen writes from Paris, in regard to the apicultural display. After describing the American exhibit he says:

This American display is the most noteworthy, practical, and beautiful of all that Americans have till now produced. An enumeration, with a short description of all the hives, implements, products, etc., would fill several volumes. Whoever would describe the same must needs write a complete handbook of American apiculture; and that is something that Europeans still lack. The English and Americans have noticeably surpassed the German bee-keepers (not to speak of others) in many respects. They may at first have learned many things of Germans, I admit; but they have learned how to apply science, and do not remain stationary. To-day can the German and Frenchman go to the English and Americans for instruction. Already what belongs to bee-lore, the Europeans can no longer measure with the Americans. It will be a long time before we in Europe shall have such a work as Root's A B C book, or Langstroth's. The only one, till now, worthy of notice, on this side of the ocean, is Gravenhorst's; and as opposed to that we have numberless works and "worklets;" and the most wonderful part of the whole is, that such books have ever seen the second and third edition.

A VISIT FROM J. W. JENKINS, OF JAMAICA, W. I.

We have just had a very pleasant call from our Jamaica correspondent, Mr. J. W. Jenkins, of Providence, Jamaica, who for three years back has been laboring as a missionary among those semi-civilized people. The island, on account of the interference of various nations, has been drained of its wealth, and the people are almost poverty-stricken. Mr. Jenkins become interested in apiculture, and at once began bee-keeping in his missionary field. His idea was to teach the natives a new source of income; and thus while he was ministering to their spiritual wants he could at the same time give them the means to administer to their own bodily wants. The bees of the island are black, and the honey resources are almost unlimited. Mr. Jenkins is sure that apiculture can be made a profitable means of livelihood, and he is very anxious that the natives have a start in this line. While they have no wintering problem to contend with, they have various species of ants which are very fond of honey, and which, unless checked, would in time prove the total destruction of the colony. To

prevent their depredations, the hives are placed on benches, the legs of which stand in zinc pans of water. There is a species of black ant, which, although very small, will in time rob a colony of its honey. One colony was put upon the ground; and it was a very noticeable fact, he says, that this colony was not doing as well as those upon the benches, the little black ants having visited it so much that its stores were reduced to almost the daily gathering. There is a species of red ant there which is much worse. They will come in droves; and if their nest happens to be at a distance from the hives, they will move into quarters in the immediate vicinity of the bees. From here they will continually sap the colonies until they have, from the ill-gotten stores, become so strong that they will in a single night destroy the colony upon which they have been preying. In most tropical countries these various species of ants are one of the greatest hindrances to bee culture. Our friend A. A. Bunker spoke of their untiring depredations in Burma on his visit to Medina.

PERSONAL LETTERS TO EDITORS WHO PUBLISH FALSE STATEMENTS.

SINCE our article on page 620, of our August 1st issue, urging bee-keepers themselves to write personal letters to offending editors, one of our subscribers has taken up the gauntlet in the following pointed paragraph. He says, in writing to the *Pittsburgh Dispatch*:

In your issue of Sunday, August 25, appeared an article on impurities in sugar by Chevalier Q. Jackson, M. D., in which he undertakes to describe American ingenuity in the manufacture of comb honey. I was greatly surprised on reading this portion of the article, for I had thought that Dr. Jackson prepared himself on the subjects which he wrote, before submitting them to the reading public.

I am convinced that he is mistaken in his statements. If he is not, he should prove their truth and claim the \$1000 reward offered by Mr. A. I. Root, of Medina, O. The latter gentleman stands pledged to pay that amount "to the person who will furnish evidence that comb honey has been manufactured, filled with honey, and capped by machinery; or who will furnish information of any place where comb honey is manufactured by machinery." The *Encyclopedia Britannica* made the same error in an article on "glucose" in its American supplement; but on being notified by Mr. Root, the publishers wrote that they had started an investigation and found that the author "had not as good grounds for his assertion as he should have had."

Those who write to instruct the public should not take hearsay statements and tell their readers they are so.

J. B. BLACK, M. D.

Duncan, Pa., Sept. 7, 1889.

That's right, doctor. This is just the way to do up these falsehoods. Editors will publish a correction, brief and courteous, when they will not notice a reprint from a bee-journal. Let more of our subscribers follow the matter up.

GREAT IS TRUTH, AND WILL PREVAIL; THE NEW YORK WORLD IN DEFENSE OF BEE-KEEPERS.

WHILE hundreds of daily and weekly papers have been slandering the comb-honey business by alleging that the article was manufactured and "deftly filled by appropriate machinery," one large daily, without any solicitation from bee-keepers, has come out and stated the honest truth. The daily to which we refer is no less than the *New York World*, which by all odds is the largest daily in the United States, and perhaps in the world. This is the clipping, which has been sent us by one of our subscribers:

HOW HONEY-COMBS ARE MADE.

Helen of Troy, Sea Cliff, L. I.—"Can you tell me

whether honey-combs are always made by bees, or are there such things as patent ones?"—"Honey in the comb is always made by bees and never by machinery. When you buy honey in that shape you may feel quite certain it is the genuine article, and that there is no patent on it. Comb foundation made of beeswax is in quite common use. On this the bees form the cells, fill with honey, and cap them.

If this is not coming out "square-toed" in favor of our much-abused industry, then we do not know what better we could have. We desire, in these columns, to thank the editor of the *World* for taking the pains to find out the truth of the matter, instead of copying the slander, which has no foundation. Now, why can't the editors of some of these smaller dailies be just as eager to copy this truth as to scatter broadcast the lying statements of some smart reporter, or the statement of some other periodical? If the *World* is as careful in other things as in this one, no wonder it has the largest circulation, and it deserves it. Give the *World* a boost, every chance you can get, so long as it sticks by the truth; and give the go-by to papers that persist in publishing falsehoods about comb honey. If more bee-keepers would stop those papers that come into their homes, which have maligned our industry, and refuse to make amends, it might help to open the eyes of these editors who have "not time to investigate the truth," but take slander because it is cheap.

Since the foregoing was written, the following item, clipped from the *Family Herald and Weekly Star*, of Montreal, Can., has been sent in. It reads as follows:

ARTIFICIAL COMB HONEY.

The *Family Herald and Weekly Star* recently published, under the heading "Curious Facts" a statement copied from an American paper, to the effect that artificial honey had been made of potato starch and oil of vitriol, the comb being manufactured out of paraffine wax. The item referred to has been going about in the American papers for some time, and the author of it is alleged to be Professor Wiley, of the United States Agricultural Department. Mr. Stewart, of Nairn, Ont., writes that he is willing to give one hundred dollars, and that A. I. Root, of Medina, Ohio, will give one thousand dollars to any one who will show them artificial comb honey and tell them where it is manufactured. But Mr. Stewart and Mr. Root are likely to keep their money, for there is no doubt that they are right. The statement that artificial comb honey has been successfully produced from potato starch, oil of vitriol, and paraffine wax, is not worthy of credence. However, even if the statement were true, it would not in any way reflect on the bee-keepers, who are, undoubtedly, a most conscientious and upright class of persons. Even those who believed the item was trustworthy would not suppose that the artificial honey was made by bee-keepers any more than they would suppose that the oleomargarine substitute for butter was made by dairymen or farmers' wives. If such artificial honey could be made it would come into competition with the bees and bee-keepers just as oleomargarine comes in competition with honest butter and those who make it.

Good for the *Star*! Give it a boost, ye Canadians! Let's patronize the papers that tell the truth about our industry. Let more papers follow suit. Surely truth will triumph in time, but we must keep fighting the falsehoods, and that, too, by personal letters from bee-keepers.

And here comes the *Maryland Farmer* for September, with a good square contradiction in regard to artificial comb honey. Friends of the *Maryland Farmer*, here is our hand; and we hope every bee-keeper who lives in your vicinity will express his thanks in the shape of a dollar for your magazine, for one year at least.

A GOOD REPORT FROM DR. MILLER.

Friend A. L.: I don't know how many times during the last few weeks Mrs. Miller has said to me something like this: "Why don't you write a note to Mr. Root, telling him of your success? He seemed much pleased and interested when here, in the honey-flow you were getting." Well, you know that at the time you were here the bees were taking a fresh start at storing. Since that time they kept it up straight along, although rather slowly, still without stop, till last week, about Sept. 5. So I have taken 11,000 or 12,000 lbs. of honey, and have sold it, and am now crowded to get it ready for shipment. You're glad, aren't you? C. C. MILLER.

The above came in a private letter; but I am sure the doctor will pardon us for letting some other friends of his have a glimpse at it. To be sure, we are glad, old friend.

SENDING BEES BY THE HALF-POUND THROUGH THE MAILS.
